REDIN'TEGRA'TION (Lat. *redintegratio*, from *redintegrare*, to restore, from *red-*, *re-*, back again, anew + *integrare*, to make whole, from *integer*, entire, from *in-*, not + *tangere*, to touch). A term first introduced into the psychology of association (q.v.) by Hamilton, for whom it meant the reinstatement, through the suggestion of one element, of all the elements which had previously constituted an act of cognition. A tendency has, however, arisen in modern psychology to restrict the word to those cases of association in which a constituent part of an original situation associatively reinstates the total situation. James calls such cases "impartial redintegration." Whether impartial redintegration ever occurs in complete form is more than doubtful; as a functional type of the reproducing consciousness it may, however, be usefully distinguished from "mixed" association and "focal" association. Consult: Sir William Hamilton, *Lectures on Metaphysics*, vol ii (2d ed., London, 1861); Thomas Reid, *Works*, vol. ii, edited by Sir William Hamilton (6th ed., ib., 1863); S. H. Hodgson, *Metaphysics of Experience* (4 vols., ib., 1898); William James, *Principles of Psychology* (2 vols., New York, 1905).

REDIS'COUNTING. Rediscounting is a term used in commercial banking to define the practice of granting credit upon notes, drafts, and other forms of commercial paper which have already been discounted for the maker or first holder. As discount of a promissory note or bill is practically a purchase by the banker who takes it for discount (subject to certain rights of recourse), so rediscount is merely the passing of it along to another purchaser. In banking practice rediscount is usually granted by a banker to another banker or to an accepting house. The note or bill, in passing through the hands of the banker making the original discount, acquires his indorsement and thereby binds him to make good the amount due on the instrument in case of default by the maker or drawee. The practice of rediscount is closely linked with that of acceptance. Acceptance in-

volves the promise of a party on whom a bill of exchange or draft is drawn, or of some one properly designated by him, that he will pay it at its due date. Such acceptance is usually indicated by the signature or the name of the acceptor across the face of the document. Acceptance under American practice was defined by the Federal Reserve Board of the United States on Feb. 8, 1915, as follows:

"In this regulation the term 'acceptance' is defined as a draft or bill of exchange drawn to order, having a definite maturity and payable in dollars, in the United States, the obligation to pay which has been accepted by an acknowledgment written across the face of the instrument by the party on whom it is drawn; such agreement to be to the effect that the acceptor will pay at maturity according to the tenor of such draft or bill without qualifying conditions."

In European banking practice "accepted" bills constitute the bulk of the paper which is rediscounted. When another party is designated as acceptor for the mercantile maker of a bill, it is known as a "domiciled bill." It is usually a banker or an accepting house of established resources and reputation, which by acceptance assumes the obligation to pay a domiciled bill at maturity which rested originally upon the maker only. Thus, a bill which has been accepted and rediscounted acquires a number of strong indorsements, which make it one of the best forms of temporary investment. As such, it is eagerly sought by bankers as almost the equivalent of cash, because the strength and reputation of the indorsers insure its soundness; its early maturity insures its prompt convertibility; and it has the advantage over cash of affording an income.

The function of rediscounting accepted paper has become, under the modern organization of banking, the distinctive function of the central bank of issue, to the partial exclusion of direct discounting, which is the function of joint-stock and private bankers. It was estimated by the governor of the Bank of France in 1908 that the proportion of paper passing through the bank which bore another banking indorsement was about 70 per cent of the whole; a similar estimate made by the officials of the Imperial Bank of Germany put the proportion for that institution at 60 per cent. In Europe the central banks continue to grant direct discounts to clients whose paper has not passed through other banks; but in the United States, under the Federal Reserve Act of Dec. 23, 1913, discounting is permitted to the regional banks only for paper offered for discount by "a member bank."

The effect of the system of rediscount and acceptance is to give to the banking system much greater flexibility and security than without it, since it affords to a joint-stock or private bank, if its cash resources are reduced, the privilege of obtaining currency or credit by presenting a part of its assets to the central bank for rediscount. First-class bankers' acceptances are often purchased as investments by private bankers and even by the central banks and are considered as so quickly convertible into cash as to constitute a secondary reserve auxiliary to the gold stock. When rediscounted paper bears the acceptance of a strong foreign bank or accepting house, it can be sold in the open market to meet liabilities abroad in lieu of the export of gold. Foreign bills have been largely held in recent years for this purpose by the Imperial Bank of Germany, the Bank of Austria-Hungary, and the National Bank of Belgium.

For an account of how the rediscount system temporarily broke down at the outbreak of the European War in 1914, but how it was ultimately utilized, see PANIC.

RED JACKET. A village in Houghton Co., Mich., in the township of Calumet (q.v.).

RED JACKET (*Sa-go-ye-wat-ha*, he keeps them awake) (*c.*1750–1830). A celebrated chief of the Seneca Indians. He received his English name in reference to the great pride he took in a scarlet jacket given to him shortly after the Revolution by an English officer. During the Revolution he fought on the side of the English and in 1784 bitterly opposed the Treaty of Fort Stanwix, by which the Iroquois ceded some of their land to the United States. Though originally without rank in his tribe, he soon, through his eloquence in council, became one of the principal chiefs. In 1810 he gave the United States government some valuable information concerning the schemes of Tecumseh and during the war on the frontier (1811–14) assisted the United States troops. Subsequently he became a confirmed drunkard and for this and other reasons was deposed by a council of chiefs in 1827, but was soon restored to his old rank. He was never prominent as a warrior and seems to have been a coward, but as an orator he was unrivaled and in council had the greatest influence. By many he has been considered the most eloquent speaker the Indian race ever produced. Though at first in favor of the education of his people, he subsequently changed his mind and became the bitterest opponent of schools and Christianity. He has been called "the last of the Senecas," having been the last of that tribe's great chiefs. Consult W. L. Stone, *Life and Times of Sa-go-ye-wat-ha, or Red Jacket* (Albany, 1866), and J. N. Hubbard, *An Account of Sa-go-ye-wat-ha, or Red Jacket, and his People, 1750–1830* (ib., 1886).

RED'LANDS. A city in San Bernardino Co., Cal., 68 miles by rail east of Los Angeles, on the Santa Fe and the Southern Pacific railroads (Map: California, H 8). It lies in the San Bernardino foothills in one of the most beautiful regions of the State. The city is the seat of the University of Redlands and has an excellent system of public schools, the A. K. Smiley Public Library, several clubs, and 10 parks. Located in one of the greatest orange-producing regions in the world, Redlands is an important centre, shipping about 5000 carloads of oranges a year, besides large quantities of other fruit. Among its manufactures are brick, piping, and lumber products Redlands was settled in 1881 and incorporated in 1888. Pop., 1900, 4797; 1910, 10,449; 1915 (U. S. est.), 13,428.

RED LEAD. See MINIUM; PAINT, MINERAL.

REDLEG. The red-legged partridge. See PARTRIDGE.

RED-LETTER DAY. A lucky day, a fortunate or auspicious day; so called because in the old liturgical books the greater holy days were always marked with red letters. See RUBRIC.

REDLICH, rāt'lĭk, JOSEPH (1869–). An Austrian legal scholar, born at Göding. He

became a professor at the University of Vienna and in 1910 lectured at Harvard University. In 1915 he made investigations in the United States for the Carnegie Foundation and as a result published *The Common Law and the Case Method in American University Law Schools*. Redlich praised highly the high standards of law teaching in the United States. While approving the case method, he warned against the danger of its exclusive use. His other publications include: *Englische Lokalverwaltung* (1901; Eng. trans. as *Local Government in England*, 1903); *Recht und Technik des englischer Parlamentarismus* (1905; Eng. trans. as *The Procedure of the House of Commons*, 3 vols., 1908); *Das Wesen der osterreichischen Kommunalverfassung* (1910).

RED LIQUOR. A crude aluminium acetate used as a mordant in calico printing. It is prepared in various ways, often by dissolving eight parts of alum in boiling water, which is then added to a solution of six parts of lead acetate, and the mixture is well stirred. Lead sulphate is formed, which is precipitated as a heavy mass, the supernatant clear liquid being the red liquor.

RED LODGE. A city and the county seat of Carbon Co., Mont., 62 miles southwest of Billings, on the Northern Pacific Railway (Map: Montana, G 4). Situated 5500 feet above the sea level, it is the commercial centre for a farming, stock-raising, and coal-mining district. Settled in 1887, the city was incorporated in 1894. Pop., 1900, 2152, 1910, 4860.

RED MEN, IMPROVED ORDER OF. A secret, charitable, and benevolent fraternity which in its present form was reorganized at Baltimore, Md., during the winter of 1833–34. It traces its origin, however, back to the Sons of Liberty, the secret revolutionary society which first appeared in Maryland in 1764–65, and through them to the various Tamina societies into which the Sons of Liberty merged in 1771–1810, and finally to the Society of Red Men formed at Philadelphia in 1813, at first political and afterward social and convivial, which virtually became extinct about 1830. See SONS OF LIBERTY; SECRET SOCIETIES, PATRIOTIC-POLITICAL.

The reorganized or Improved Order of Red Men eliminated both politics and conviviality and adopted as its motto "Freedom, Friendship, and Charity." George A. Peter, first sachem of Logan Tribe No. 1 of Baltimore, is considered the founder of the order. During the first 14 years of the life of the reorganized fraternity only 10 tribes, as Red Men's Lodges are called, were formed, but from 1880 to 1895 it grew rapidly, is now found in all the States of the Union and has maintained a large annual increase, the total in 1915 being more than 496,000. Tribes have also been established in the Panama Canal Zone, in the Hawaiian Islands, and in the Philippines, but membership there is not large. The reorganized society possesses quite different characteristics from the several secret political associations which it is said to have succeeded and attracts attention in that in a circumscribed way it seeks to conserve the history, customs, legends, expressions, words, and names of the aboriginal Americans, although North American Indians are not eligible to membership. The Improved Red Men meet in a wigwam on such and such a sun of a certain moon, where a council fire is kindled instead of the meeting being called to order, and is quenched when the gathering adjourns. Money is described as fathoms, feet, and inches, instead of dollars, dimes, and cents, and every initiate who becomes an adopted paleface is invested with a new proper name, often that of a bird or animal. The ceremonials of the order include the degrees of adoption, hunter, warrior, and chief. The Chieftain's League is a uniformed rank within the organization, and the Degree of Pocahontas is the branch to which women relatives of Red Men may become members, together with such of the Red Men themselves as choose to join the order. The total membership of the Degree of Pocahontas is about 86,000, of which about 50,000 are women.

RED'MOND, JOHN (EDWARD) (1851–). An Irish parliamentary leader, born in Waterford. He studied at the Jesuit College of Clongowes in Kildare and at Trinity College, Dublin, entered the House of Commons for New Ross in 1881, and was called to the bar at Gray's Inn, London, in 1886. In the House of Commons, where he sat for New Ross until 1885, for North Wexford from 1885 to 1891, and subsequently for Waterford, he became one of the most prominent organizers of the Home Rule propaganda. On the break in the Nationalist ranks consequent on the Parnell (q.v.) divorce case, Redmond sided with the minority which supported Parnell's leadership; but in 1900 he became a leader in the movement for union, and was chosen to succeed Dillon as head of the reorganized party. His leadership was aggressive and able. In 1905 he visited the United States on matters connected with the cause of Home Rule. As a result of the great triumph won by the Liberals in the election of January, 1906, the Home Rule agitation under Redmond's leadership took on renewed activity and was continued until the passage of the Home Rule Bill in 1914. In May, 1915, presumably to conciliate Nationalist Ireland, Redmond was offered a place in Asquith's coalition cabinet, but he declined. Consult: Justin McCarthy, in *British Political Portraits* (New York, 1903); L. G. Redmon-Howard, *John Redmond, the Man and the Demand* (ib., 1911); A. G. Gardiner, in *Prophets, Priests, and Kings* (ib., 1915).

RED OAK. A city and the county seat of Montgomery Co., Iowa, 54 miles by rail east by south of Omaha, Neb., on the East Nishnabotna River and on the Chicago, Burlington, and Quincy Railroad (Map: Iowa, B 3). It makes calendars, concrete pipe, and flour, and has ironworks and a canning factory. Pop., 1900, 4355; 1910, 4830.

RED OCHRE. See HEMATITE.

REDON, *re-dôn'*, ODILON (1840–1916). A French painter, etcher, and lithographer. He was born at Bordeaux and passed his youth in a remote part of La Gironde, the romantic aspect of which left its impress on his character and art. Owing to physical weakness his education began late. He first took up painting in the atelier of Gérôme, but he was more influenced by association with the botanist Clavaud, who encouraged his predilection for Delacroix. Redon's art is essentially visionary, but expressed in the language of reality. It shows mastery of chiaroscuro and of the rhythmic line. A spirited lithographer and etcher, Redon also designed tapestries for the Gobelins. In the Luxembourg he is represented

by "Les Yeux Clos" (Closed Eyes). Consult Redon, "Confessions," German translation, in *Die graphischen Künste* (Vienna, 1913).

REDONDELA, rā'dŏn-dā'là. A town of northwest Spain, in the Province of Pontevedra, situated at the head of the Bay of Vigo, 12 miles south of Pontevedra (Map: Spain, A 1). The inhabitants are chiefly engaged in fisheries. Pop., 1900, 11,488; 1910, 11,985.

REDON'DO BEACH. A city in Los Angeles Co., Cal., about 20 miles southwest of Los Angeles, on the Pacific Ocean and on the Atchison, Topeka, and Santa Fe and the Pacific Electric railroads (Map: California, G 9). It is a popular health and pleasure resort and has a large pavilion, bathhouse, various amusement places, and good public schools. There are large wharves and railroad shops. Pop., 1900, 855; 1910, 2935.

REDOUBT, rē-dout', frequently spelled REDOUT (OF. *reduit*, Fr. *réduit*, from ML. *reductus*, refuge, redoubt, from Lat. *reducere*, to lead back, from *re-*, back again, anew + *ducere*, to lead). A field fortification. A closed fieldwork in which all or nearly all of the angles are salient. A redoubt varies in form and size according to the exigencies of the situation and the time at the disposal of the defenders. The trace or plan is usually some development of that of the lunette (q.v.), with a depth from one-quarter to one-half the length of the front. If advantageously located its shallowness aids in forming a poor target for the enemy's artillery. It is still deep enough to permit the construction of a parade which will secure the troops defending the gorge or rear. Redoubts are used where a small body of troops desires to make a strong defense. They are also used on ground immediately expected to be a battlefield. After an army takes position hasty intrenchments are constructed along the whole front, as described under *Field Fortifications* (see FORTIFICATION), and the strongest points are occupied with redoubts. Where the size of modern armies has increased so greatly that field manœuvres become impracticable and operations assume the character of a siege, the redoubt becomes simply a stronger point in a strong line. A redoubt should conform in plan as closely as practicable to the natural shape of the ground and be as inconspicuous as may be. The front parapet is designed to resist heavy field and siege gun fire; the rear to resist rifle, machine, and field gun fire. Bomb proofs are built in the work for dressing stations and for protection against mortar and curved fire.

The size of the redoubt is adjusted to the force which is to occupy it and to the ground. It should ordinarily give a yard of front to two men. If not properly located and inconspicuously designed, a redoubt may, by virtue of its inclosed form and restricted and sometimes crowded interior space, become a good target for the enemy's artillery.

Owing to the increased use of mortar and high-angle and explosive-shell fire and to the activity of air craft, increased weight is being given in design to concealment from view and to overhead cover. The cavity caused by the excavation of earth for the construction of the parapet is called the ditch, and constitutes a formidable obstacle to the enemy.

The sides of the ditch are known as the escarp and the counterscarp, respectively. (See Plan in article FORTIFICATION.) Chevaux-de-frise (q.v.) or similar constructions are placed along the bottom of the ditch. The parapet in modern redoubts is low and wide. The exterior slope of the parapet has been found to resist artillery fire to greater advantage when left at its natural slope; but the superior slope is constructed with an incline of 1 in 6, permitting the defenders to observe the ground in front of the ditch without greatly reducing the strength of the parapet. The interior slope (1 in 3 or 4) is strongly revetted and provided with ample elbow rests and positions for machine guns. Traverses (q.v.) are constructed similarly to the parapet, and are usually thrown across the covered way or other important points as a protection against enfilade fire or (as parados) to defend the troops garrisoning the rear face from fire coming from the front. In case of an attack from the rear the functions of the various parts are reversed. See SIEGE AND SIEGE WORKS.

REDOUBT. An active volcano (11,270 feet high) on the west shore of Cook Inlet, Alaska; last active in 1903 (Map: Alaska, H 5). Also called Mirando, Viesokaia (high), and Goreloi (burning).

REDOWA, rĕd'ô-wȧ (Boh. *rejdovák*, *rejdovachka*, from *rejdovati*, to turn around). A Bohemian dance introduced into Paris and London about 1846. In Bohemia two varieties exist: the Rejdóvak in $\frac{3}{4}$ or $\frac{3}{8}$ time and the Rejdóvacke in $\frac{2}{4}$ time. The dance resembles the Polish mazurka. Meyerbeer introduced it into his opera *Le prophète* in 1849.

RED'PATH, JAMES (1833–91). An American journalist and political writer, born in Berwick-on-Tweed, Scotland. He went to New York at 18 and joined the staff of the *Tribune*. By his writing he came to be known as an Abolitionist. Through a Haitian bureau and his weekly, *Pine and Palm*, he induced several thousand negroes to emigrate to Haiti, where he had been commissioner of education in 1859. During the war he was with the armies of Sherman and Thomas. Later, while superintendent of education at Charleston, he reorganized the school system of South Carolina. During the Irish famine of 1881 he represented the New York *Tribune* in the famine district, and afterward lectured and founded *Redpath's Weekly* (1881–83) to promote the Irish cause. He was an editor of the *North American Review* and published books on Haiti, Ireland, and the South.

REDPOLL, rĕd'pōl'. A small northern linnet-like finch of the small genus *Acanthis*, visiting the United States and central Europe in winter. The plumage is streaky, with dusky white and buffy shades, the face and throat often blackish. The males have the crown crimson and the breast rosy or carmine. All the redpolls are birds of high latitudes and breed in extreme Arctic regions, making nests of dried grasses, lined with hair, feathers, and down, in a low bush or tuft of grass, and laying pale-blue, finely speckled eggs. The best known in America is the common redpoll (*Acanthis linaria*), a bird less than 5½ inches long, appearing irregularly in the Northern States, in flocks of considerable size and, like goldfinches, feeding on small seeds.

RED POLLS. See CATTLE.

RED RIDING HOOD, LITTLE. The popular fairy tale of the little girl devoured by the wolf which personates her grandmother. The

source of the English version is *Le petit chaperon rouge* in Perrault's *Contes du temps passé* (1677). Tieck gives the tale in his *Volksmarchen* in 1795, and the brothers Grimm in their collections of fairy tales. In the latter the wolf is cut open by a hunter and the child is set free; this feature allies the story with many monster-swallowing incidents in various folklore, while the tale itself in varying forms is widespread.

RED RIVER, or SONG-KOI. A river of Tongking, French Indo-China. It rises in the mountains of south China and flows in a nearly straight southeast course of over 600 miles, emptying into the Gulf of Tongking through a large delta (Map: French Indo-China, D 2). In its upper reaches the river flows through deep gorges and becomes navigable only on its entry into Tongking at Lao Kai, where steamer service has been provided. Hanoi, the capital of Tongking, lies on its banks, and the river is of considerable commercial importance. Its main tributaries, the Black and the Clear, are navigable for some distances, and its delta is the most fertile and populous part of the country.

RED RIVER. The southernmost of the large tributaries of the Mississippi. Its headwaters include several forks all of which originate in northern Texas. The main stream flows east, forming the boundary between Texas and Oklahoma until it enters Arkansas, where it turns to the south and, entering Louisiana, traverses the State in a southeasterly direction to its junction with the Mississippi, 341 miles above the mouth of the latter (Map: Texas, E 3). It is 1045 miles long and drains an area of 89,970 square miles. For the first 60 miles it flows through a cañon with perpendicular rocky sides 500 to 800 feet high, after which it enters a sandy and arid plain, where it broadens out to a width of nearly 3000 feet, but with a very shallow depth. Farther down it enters the fertile alluvial bottoms, which throughout its middle course are densely wooded. Here the river shows a remarkable tendency to form snags or rafts of driftwood. Up to 1873 such a raft of tree trunks and driftwood 32 miles long extended from a point some distance above Shreveport, La. In that year a navigable channel was cut through, and now the river is kept clear by constantly removing the floating timber. In its lower course in Louisiana the Red River sends out numerous bayous, some of which rejoin it, while others penetrate directly to the Gulf of Mexico, parallel with the Mississippi. It has a navigable length of about 1250 miles, and its tributaries, chief of which is the Washita, afford in addition 2100 miles of navigable waterways. Steamers drawing 4 feet can ascend to Shreveport at all seasons except in extreme low water, while at high water they can reach nearly to the Texan boundary. Consult Marcy, *Exploration of the Red River of Louisiana* (Washington, 1853).

RED RIVER. A river rising in the northwestern part of Minnesota a few miles from the sources of the Mississippi (Map: North Dakota, H 3). It flows first southward through a chain of numerous lakes, then westward to the boundary between Minnesota and North Dakota, which it follows in a northerly course until it enters Manitoba, where it empties into the southern extremity of Lake Winnipeg. Its length is about 700 miles. Its course lies through an almost perfectly level plain which was formerly the bottom of Lake Agassiz (see LAKE) and which is a famous wheat-producing region. The river and its branches have cut narrow channels through the plain with clay banks 20 to 60 feet high. A southern branch connects through Lake Traverse with the Minnesota and Mississippi rivers, so that during high water small steamers may sometimes pass from the Mississippi to Lake Winnipeg. The main stream is navigable from Grand Forks to Winnipeg. Owing to the difference in latitude between the upper and lower courses, spring sometimes arrives at the former while the latter is still icebound, so that the waters are piled up and inundate the plain.

RED'ROOT'. A popular name for various unrelated plants. One of the best known is *Lachnanthes tinctoria*, of the family Hæmodoraceæ,

REDROOT (*Lachnanthes tinctoria*).

which grows in wet sandy soils near the coast of the eastern United States. It has sword-shaped leaves mostly close to the ground and an unbranched almost leafless stem which bears at its summit a dense compound cyme of woolly yellow flowers. The perennial roots contain a red coloring matter sometimes used in dyeing. Alkanet (*Alkanna*, or *Anchusa tinctoria*), certain American pigweeds (*Amaranthus* spp.), and *Ceanothus americanus* are also called redroot. See ALKANET; AMARANTH; CEANOTHUS.

RED'RUTH. A town in Cornwall, England, the centre of a famous mining district, 9½ miles northwest of Falmouth (Map: England, A 6). In 1792 gas was first used here for lighting purposes. Tin, from numerous mines in the vicinity, is smelted in the town, and iron foundries are in operation; another important product is copper. Pop., 1901, 10,451; 1911, 10,814.

RED SANDSTONE. A term formerly applied to the combined Devonian and Permian rocks when their relations to the Carboniferous

strata were unknown. The discovery that one part of the Red Sandstone was below the coal, while the other was above it, caused the division into the Old Red Sandstone, or Devonian, and the New Red, or Permian. For some time after this division the original term was retained by a few geologists, but it is now quite given up. See OLD RED SANDSTONE; PERMIAN SYSTEM.

RED SCALE. The name applied in Florida to *Aspidiotus ficus* and in California to *Aspidiotus citri*, two common and destructive enemies of the orange. See ORANGE INSECTS.

RED SEA (Lat. *Mare Rubrum*, Gk. *Ἐρυθρὴ Θάλασσα*, *Erythrē Thalassa*), or ARABIAN GULF. An arm of the Indian Ocean separating the Arabian peninsula from northeast Africa and lying between lat. 12° 30′ and 30° N. (Map: Africa, H 2). It extends in a northwest direction from the Strait of Bab el Mandeb, 20 miles wide, through which it communicates with the Gulf of Aden, to the Isthmus of Suez, and is about 1200 miles long. It is narrowly elongated in shape, with a breadth between 100 and 200 miles. In the north the sea divides into two arms, cutting off the Sinai Peninsula: these are the Gulf of Suez in the west, 170 miles long and 25 miles wide, and the Gulf of Akaba in the east, 110 miles long and 12 miles wide. The Gulf of Suez is connected by the Suez Canal (q.v.), about 100 miles long, with the Mediterranean. The basin of the Red Sea is formed by a line of fracture running through the great Archean mass capped by the limestone plateaus of Egypt and Arabia, and is a part of the great series of rift valleys which extends from the Dead Sea to Lake Tanganyika. The Archean rocks are exposed here and there along the coast. A branch fissure with steep rocky sides forms the Gulf of Akaba and runs northward as the depression called El Arabah, the deep sink of the Dead Sea, and the valley of the Jordan. The shores of the Red Sea are bordered on the Arabian side by sandy deserts, which form a narrow strip backed by the limestone range. On the Egyptian side there are wide, sandy plains in the north, rising farther south into elevated table-lands and finally into the mountains of Abyssinia. Each shore, particularly the east, is lined with immense coral reefs, both barrier and fringing; the former in some places are 25 miles or more from land and inclose channels. They have also occasioned numerous islands and archipelagoes. The principal groups are the Farsan Islands near the Arabian shore and the Dahlak Islands near the African. The mean depth of the Red Sea is about 2000 feet. Through the greater part of its length runs a central channel with a depth exceeding 3000 feet, divided by comparatively shallow ridges into three basins, of which the northern and the southern have a maximum depth of about 4200 feet and the central of nearly 7500 feet. The Strait of Bab el Mandeb is 1200 feet deep. In the Gulf of Suez the depth is scarcely more than 200 feet.

The mean temperature of the surface water is 77° in the north, 80° near the middle, and 84° in the south. Below a depth of 1200 feet there is a uniform temperature of 71° in all parts of the sea and down to the greatest depths. The sea differs in this respect from the open ocean, where the temperature continues to fall through a much greater depth. The surface temperature of the Red Sea sometimes rises above 100°, and there is an enormous evaporation, the air being almost constantly saturated as fast as it is supplied by the winds. The heat being intense, the climate on the Red Sea is depressing because of this great humidity. The salinity of the Red Sea amounts to about 4.2 per cent, increasing with the depth, and is nowhere as low as that of the ocean, 3.5 per cent. The tides are irregular and in some places imperceptible. The prevailing winds are north and northwest, but they change to the northeast during winter. The marine flora and fauna of the Red Sea are very rich and interesting. The indigenous species are quite different from those of the Mediterranean, showing that the two seas must have been separated since the Eocene epoch. Since the opening of the Suez Canal, however, there has been a considerable intermigration. From the earliest times the Red Sea has been a great highway of commerce between India and the trading peoples of the Mediterranean lands, and was used successively by the Egyptians, the Phœnicians, the Arabs, and in the Middle Ages by the Venetians, until the discovery of the route around the Cape of Good Hope. Since the opening of the Suez Canal in 1869 it has regained its importance as the main route of commerce between Europe and the East.

Consult: W. Kropp, "Physical Geography of the Red Sea," in United States Hydrographic Office, *Publication No. 39* (Washington, 1872); Josef Luksch, *Vorlaufiger Bericht uber die physikalisch-oceanographischen Untersuchungen im Roten Meer* (Vienna, 1896); Hood, "The Red Sea Currents and Navigation," in *Nautical Magazine*, vol. lxviii (London, 1899).

REDSHANK. One of the best known of the British and European sandpipers (*Totanus calidris*), having conspicuous red feet. Cf. GREENSHANKS.

RED-SHOULDERED HAWK. See BUZZARD; HEN HAWK.

RED SNAPPER. See SNAPPER.

RED SNOW. A phenomenon similar to blood rain (q.v.), noted at rare intervals and best exemplified in the Arctic regions where it has been described by Captain Ross and others. Minute particles, commonly of organic nature, that existed in the atmosphere at the time of the snowfall are the source of the coloration.

RED SPIDER. A name among florists for one of the spinning mites of the genus *Tetranychus*, and particularly of *Tetranychus telarius*, a cosmopolitan species, probably originally European. They frequently do considerable damage to plants, causing the leaves to turn a rusty color, but they may be kept in check by the application of a kerosene-emulsion spray to which flowers of sulphur has been added. See HOP INSECTS; MITE.

RED'START (from *red* + *start*, AS. *steort*, Ger. *Sterz*, tail; perhaps connected with OHG. *sturzen*, Ger. *sturzen*, to hurl, or with Gk. *στόρθη*, *storthē*, prong). Either of two small warblers. The American redstart (*Setophaga ruticilla*) is one of the wood warblers (q.v.). The male is black, with white belly, and the sides, basal half of wing, and tail feathers are bright salmon red; the female is ashy where the male is black and yellow where he is salmon. It winters in tropical America, but appears in the United States early in the spring. The nest is built of fine strips of bark, leafstalks, and the like, lined with fine rootlets, in the fork of a small tree some distance from the

ground. The eggs are white spotted with brown. The redstart feeds wholly upon insects, which it pursues with great activity. He is not much of a songster, but his beauty and liveliness make him a well-known and popular bird. See Colored Plate of AMERICAN WOOD WARBLERS with the article WARBLER.

The European redstart is a similar bird, but of the family Sylviidæ, and is widely diffused over Europe, Asia, and the north of Africa. It has a very soft, melodious song, which is continued during the breeding season far into the night and resumed at early dawn. In confinement it becomes very tame, and has been known to imitate the song of other birds, and even to learn a tune.

RED-TAILED HAWK. See BUZZARD; HEN HAWK.

RED TAPE. A term used to denote excessive routine and formality in the management of official affairs; a servile adherence to precedent. Before the invention of the modern appliances for securing papers all official documents were tied together by red cotton or linen tape. The necessary delay caused by the undoing of tapes by slow-moving government officials before business could be transacted came at length to stand as representative of all delays.

REDTOP GRASS (*Agrostis alba* and its variety *vulgaris*). This grass varies greatly in its habit of growth. Some of its forms are tall growing and are largely cultivated for hay, being usually sown in mixtures with timothy and clover. It is one of the best grasses for permanent pastures in the New England and Eastern States, and thrives best in moist soils unsuited to other valuable grasses. When once established this grass will maintain itself against encroachment by weeds or less valuable grasses. Some forms are very useful for lawns. This grass is also called fiorin, bent grass, and, in the eastern United States, herd's grass. The names are all applied to other species of *Agrostis* in different regions. In Alaska the name "redtop" is applied to *Calamagrostis langsdorfii* and other species.

REDUC'TASE. See OXIDASE.

REDU'PLICA'TION (Lat. *reduplicatio*, from *re-*, again + *duplicare*, to double, from *duplex*, double, from *duplus*, double, from *duo*, two + *-plus*, -fold). In inflection (q.v.), a prefix to a word which normally consists of the initial consonant or consonants with a vowel which is either the vowel of the root (q.v.) of the word or is *e*. The reduplication is generally found in verbs, although it sometimes occurs in the formation of nouns. In the verb it is a characteristic in Sanskrit (q.v.) and Avesta (q.v.) of the intensive and desiderative formations, as Skt. *hanti*, kills, *jañghanti*, kills repeatedly, *jighāṁsati*, desires to kill. It is also found in some aorists, as Skt. *dharati*, holds, *adīdharam*, I held, and in a number of present formations, Skt. *dadāmi*, Gk. *δίδωμι*, I give. It is most usually found, however, in the perfect tense, of which it is a distinguishing mark in Sanskrit, Avestan, and Greek, as Skt. *dvēsti*, hates, *didvēṣa;* Av. *didvačža*, I hated; Gk. *λύω*, I loose, *λέλυκα*, I loosed. There are sporadic instances in Latin, as *mordeo*, I bite, *momordi*, I bit, or *tendit*, he stretches, *tetendit*, he stretched; while examples are comparatively numerous in Gothic, as *faifāh*, seized, from *fāhan; haihāit*, called, from *háitan; taitōk*, touched, from *tēkan*. Reduplication is also found in many languages not belonging to the Indo-European family where it usually signifies increase, as Malay *tuwantuwan*, masters (*tuwan*, master), Jap. *jamajama*, mountains, etc. In English it has occasionally a diminutive sense, as *flip-flap*, *snip-snap*. The original force of the reduplication seems to have been intensive or perfective. This view explains its use in the perfect and aorist tenses of the verb and also its employment in the Sanskrit intensive and desideratives. Its occurrence in nouns is probably based on analogy with its normal use in the conjugation of verbs. Consult Karl Brugmann, *Vergleichende Grammatik der indogermanischen Sprachen*, vol. ii (Strassburg, 1913), and Leonard Bloomfield, *Introduction to the Study of Language* (New York, 1914).

RED VIRGIN, THE. See MICHEL, LOUISE.

RED WATER. At times the water of the open sea near coast lines and of harbors more or less suddenly turns red and at the same time the phenomenon is accompanied by the death of fishes and mollusks in great quantities. This has been found to be due to the presence in enormous numbers of an animalcule known as *Peridinium* (or *Glenodinium*). This is an infusorial form representing a singular type of flagellate protozoa, class Mastigophora and order Dinoflagellata. It differs from ordinary flagellate infusoria by being protected by a remarkable and often beautifully ornamented and complex shell formed of cellulose. The body is nearly symmetrical; from a longitudinal groove springs a large flagellum, while a second flagellum lies in a transverse groove. The protoplasm in one species examined contains chromatophores colored with chlorophyll, or an allied pigment of a yellow color, called diatomin. Other forms live in fresh water.

GLENODINIUM.

RED WATER, BLOODY URINE, MOOR ILL, HÆMATURIA, HÆMAGLOBINURIA. An affection of cattle, and occasionally of sheep, attributed to eating coarse, indigestible, innutritive food, continued exposure to inclement weather, and other indefinite causes. Attention to the proper nutrition of the stock, a supply of good water, and the improvement of pastures by draining, liming, and manuring, have been recommended as preventives. The term has also been applied to the specific disease Texas fever, due to the bloodstained urine. Consult V. T. Atkinson and others, *Special Report on Diseases of Cattle*, published by the United States Bureau of Animal Industry (rev. ed., Washington, 1912), and J. W. Kalkus, "A Preliminary Report on the Investigations of Bovine Red Water (Cystic Hematuria) in Washington," in Washington State Agricultural Experiment Station, *Bulletin No. 112* (Olympia, 1913).

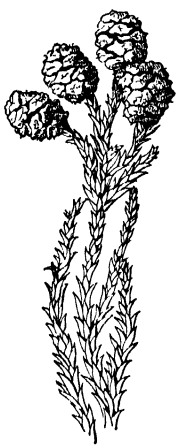
RED'WAY, JACQUES WARDLAW (1849–). An American geographer, born near Murfreesboro, Tenn. He was educated at the University of California and studied also at Munich. He was instructor in chemistry at the former institution, later served as professor of physical geography and chemistry at the State Normal School of California, engaged in mining engineering and exploration in Arizona and California in 1870–80, and traveled ex-

tensively in South America, Europe, and Asia. Redway edited *Sir John Mandeville's Travels* (1899) and Kinglake's *Eothen* (1899) and is author of a *Manual of Geography* (1887) and joint author of the "Natural Geographies Series" (1897, 1907) and of many other textbooks in this and related fields.

RED WHELK. The common spindle shell (q.v.).

RED WING. A city and the county seat of Goodhue Co., Minn., 40 miles southeast of St. Paul, on the Mississippi River, here spanned by a high bridge, and on the Chicago, Milwaukee, and St. Paul and the Chicago Great Western railroads (Map: Minnesota, E 6). It has the State training school for delinquent children, the Red Wing Seminary, the Lutheran Ladies' Seminary, two public parks, a home for the aged, and city and private hospitals. Red Wing is situated in a rich agricultural region, but is better known for its manufactures of stoneware, sewer pipe, furniture, linseed oil, malt, beer, brick, lime, hats, flour, lumber products, shoes, boats, cigars, leather, wagons, and cooperage and foundry products. The government is vested in a mayor, elected biennially, and a unicameral council. Settled in 1845, Red Wing was incorporated in 1858. Pop., 1900, 7525; 1910, 9048; 1915 (U. S. est.), 9850.

RED'WING'. 1. An American blackbird (*Agelaius phœniceus*) of the oriole family (Icteridæ). The male in full plumage is jet black, with the bend of the wing bright scarlet, bordered with buff. The female is variegated with brown and buff, black and white. The redwing is 9½ inches long. It breeds throughout the United States, but winters from Virginia southward. The nest is built of coarse grass and rushes among the bushes or reeds of a swamp, and the eggs are pale blue, with peculiar penstroke markings of dark purple or black. (See Colored Plate of EGGS OF AMERICAN SONG BIRDS.) The note is a loud clear call well imitated by the syllables *cong-ka-rée*, the last one accented and prolonged. The redwing is one of the first of the spring migrants in the northern United States and often appears in large flocks. Even when breeding the birds are more or less sociable, and several pairs are usually found in the same marsh. Like its relatives, the other blackbirds and the bobolink, the redwing feeds on both insects and seeds and also enjoys unripe corn or grain, and occasionally raids the maize fields to a destructive extent. See BLACKBIRD.



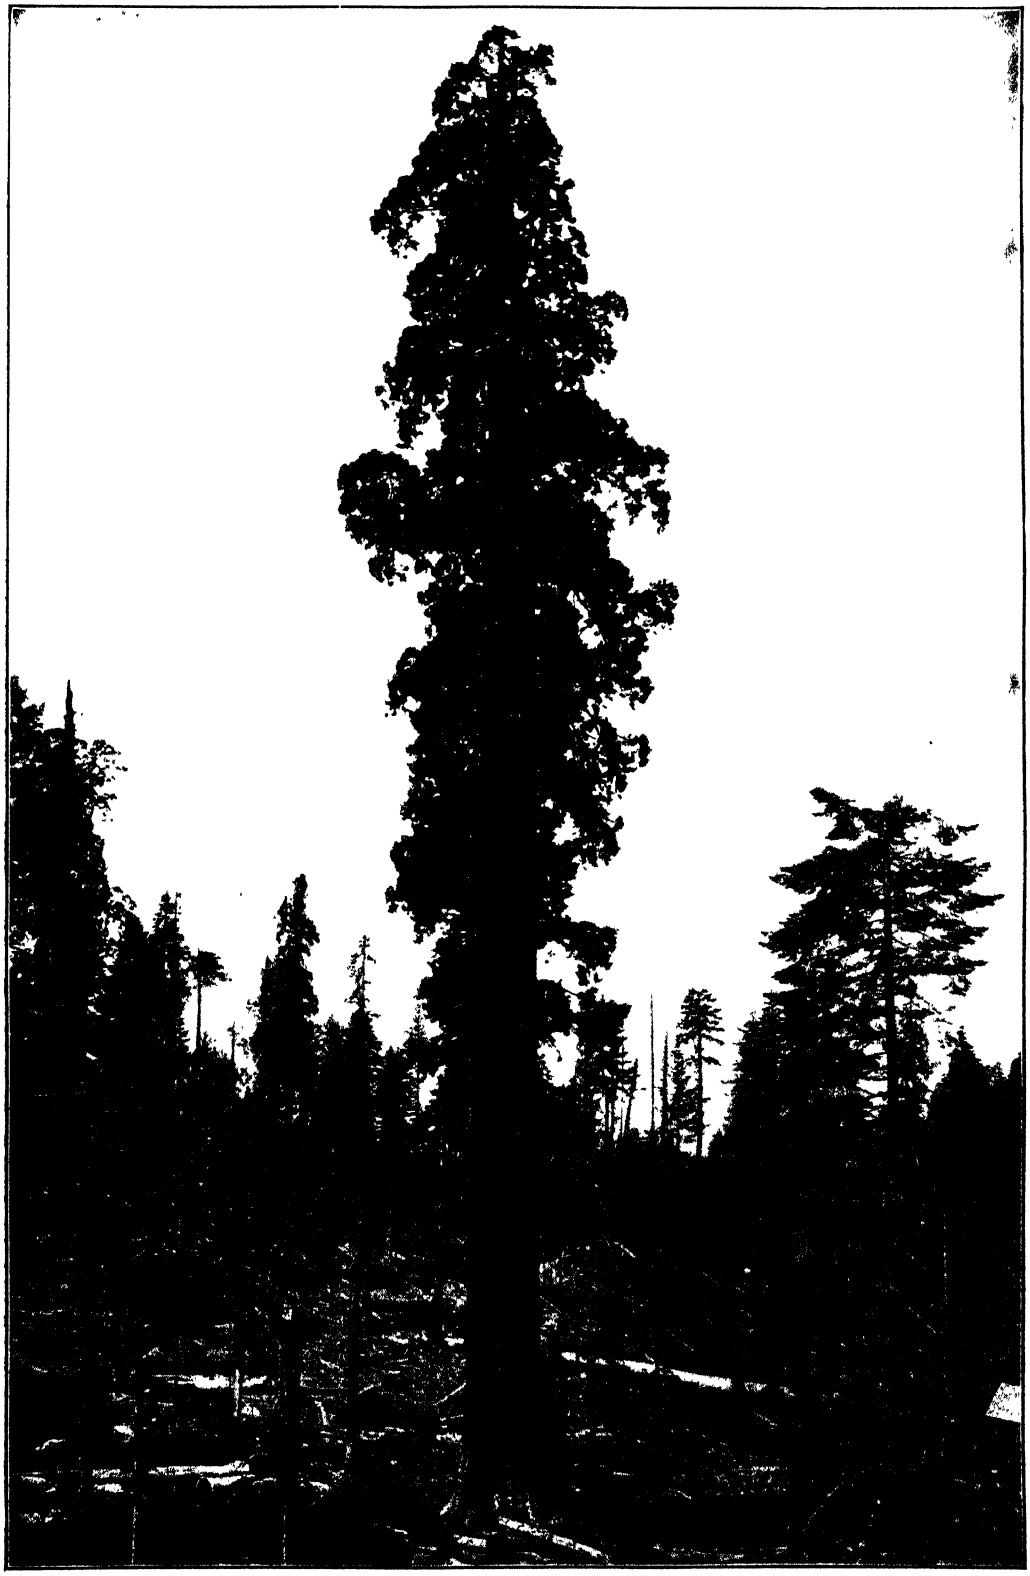
2. An English thrush (*Turdus iliacus*) which spends the summer in the northern parts of Europe and Asia and migrates southward in winter as far as the Mediterranean. The general color is a rich clove brown on the head, upper parts of the body, and tail; the lower parts whitish, tinged and streaked with brown; the under wing coverts and axillary feathers bright reddish orange. The redwing congregates in large flocks and has an exquisite song.

3. One of several other birds with red on the wings, as one of the South African partridges (*Francolinus levaillanti*).

REDWITZ, rĕt'vĭts, OSKAR, BARON VON (1823–91). A German poet, dramatist, and novelist, born in Lichtenau, near Ansbach. He is best known for his ultrapatriotic poem *Das Lied vom neuen deutschen Reich* (1871; 11th ed., 1876), a kind of epic in sonnets. Other noteworthy poems by him are *Amaranth* (1849; 44th ed., 1904), a tale in verse, and *Odilo* (1876; 4th ed., 1883). A novel, *Hermann Stark* (1868), and the dramas *Philippine Welser* (1859), *Der Zunftmeister von Nürnberg* (1860), and *Der Doge von Venedig* (1863) may also be named. Consult A. Bacmeister, *Oskar Redwitz und seine Dichtungen* (Hanover, 1854), and Gmelin and Ernst, "Zur Entstehungsgeschichte des Amaranth," in *Euphorion*, vol. iv, supp. (Leipzig, 1897).

RED WOLF. See MANED WOLF.

RED'WOOD' (*Sequoia sempervirens*). A California coniferous tree which grows upon the Pacific coast mountains, next in size to the tree commonly called *Sequoia gigantea*, or big tree. (See SEQUOIA.) It often attains a height of 250 feet and sometimes 300 feet, with a diameter, in the largest, of 15 feet. The young wood is red, but on exposure to the air and light it sometimes fades. The timber, which is common on the Pacific coast, is soft and straight-grained, easily worked, durable, and well suited for inside finishing of houses, since it takes a good polish. The redwood sends up suckers from the stumps and seeds itself well, so that the forests are maintained. Redwood is also a name given to *Soymidia febrifuga*, a tree of India, where the wood is much used as a dye. See SEQUOIA, and Plate of SEQUOIA.



A BRANCH OF REDWOOD.

REDWOOD, SIR BOVERTON (1846–). An English consulting chemist and authority on petroleum. He was born in London, studied at University College School, and learned pharmacy. As an expert on coal oils Redwood traveled in Europe and America and acted as a member of technical juries of award in international expositions. He became an authority in regard to legislation on oil trade. He was knighted in 1905, and was made Baronet in 1911. His published works include: *Cantor Lectures on Petroleum and its Products* (1886); *Petroleum: Its Production and Use* (1887); *Treatise on Petroleum* (2 vols., 1896; 3d ed., 3 vols., 1913); *The Detection of Inflammable Gases* (1896), with Clowes; and, with J. H. Thomson, *Handbook on Petroleum* (1901; 2d ed., 1906) and *The Petroleum Lamp* (1902).

REE. A North American Indian tribe. See ARIKARA.

REED (AS. *hrēod*, OHG. *hriot*, *riot*, Ger. *Ried*, *Riet*). The common name of certain tall grasses growing in moist or marshy places. The common reed (*Phragmites communis*) is abundant in continental Europe, Asia, and America in wet meadows and stagnant waters and by the banks of rivers and ditches. It grows chiefly in rich alluvial soils. The hard, almost woody culms are 5 to 10 feet high and bear at the top a large reddish-brown or yellowish much-branched panicle. They are used for making garden screens, light fences, and frameworks to be covered with clay in partitions and floors. Cattle readily eat the young shoots, but refuse the hard old ones. The plant rarely perfects its seed, but spreads by its rootstocks, which often extend for 20 or 30 feet. Nearly allied to

REDWOOD

SEQUOIA SEMPERVIRENS

this is *Arundo donax*, the largest of European grasses. It is 6 to 12 feet high and has thick, hollow, woody culms and a purplish-yellow panicle, silvery and shining from silky hairs. The woody stems are an article of commerce and are used by musical-instrument makers for reeds of clarinets and mouthpieces of oboes. They are also made into walking sticks and fishing rods. The creeping roots contain much starch and some sugar. *Arundo karka* is supposed to be the grass called Sur in Sinde, of which the flower stalks are very fibrous; and the fibres, being partially separated by beating, are twisted into twine and ropes. The sea reed (*Ammophila arundinacea*) grows along the sandy shores of the Great Lakes and the Atlantic Ocean and is one of the best sand-binding grasses for regions adapted to its growth. The small cane *Arundinaria tecta* is called reed in the United States. *Cyperus papyrus*, from which the ancients made paper, is often called paper reed.

REED. In music, a thin strip of cane, wood, or metal secured at one end in front of an aperture, through which a current of air passing sets it in vibration. The vibrations thus started are either communicated to an inclosed column of air or are released into the open air, in either event producing a musical sound. The reed is of two kinds, the *beating* reed and *free* reed. The former is used in the reed pipes of an organ (q.v.) and requires to be placed within a tube in order to produce a musical sound. It consists of a metallic cylinder, with the front part cut away, and a brass spring or tongue placed against the opening and attached at the upper end. The resultant note is dependent for its pitch on the length of the tongue, which is regulated by a strong spring of wire pressing against it. The quality of the sound is determined to a large extent by the length and form of the pipe in which the reed is placed. The double reed consists of two beating reeds striking against each other. The free reed differs from the beating reed in that the tongue is a little smaller than the opening and strikes, not the edge of the opening, but the air. Its note is more smooth and mellow than that of the beating reed, and it has the advantage of not requiring a pipe, which is a necessary appendage to the latter. Besides being occasionally adapted to organ pipes, it is used without a pipe in the concertina and harmonium. The history of the beating reed can be traced back to the earliest known civilizations; the single form is now represented by the clarinet, chalumeau, and saxophone; while the double form is now seen in the krumhorn, oboe, and bassoon. A combination of both forms is found in the bagpipe (q.v.). The free reed was introduced into Europe in the eighteenth century, its prototype being the Chinese chêng. See HARMONIUM; MUSICAL INSTRUMENTS.

REED, ANDREW (1787–1862). An English clergyman and philanthropist. He was born at Beaumont House, St. Clement Danes, London. In 1807 he entered Hackney College and in 1811, after preaching in many parts of England, he settled in the Congregational Chapel at New Road, London. He continued the pastorate of this congregation until 1861, having built a new chapel in 1831. As a philanthropist his efforts were devoted to the establishment of orphan asylums. His other charitable works were the Asylum for Idiots, founded in 1846, and the Royal Hospital for Incurables, begun in 1855, with its home at Putney House, Surrey. He was the author of numerous hymns and of various works of a religious character, and of *A Narrative of a Visit to American Churches* (2 vols., 1836). Consult his *Memoirs*, edited by his sons (London, 3d ed., 1867).

REED, CHARLES ALFRED LEE (1856–). An American surgeon, born at Wolfe Lake, Ind. He graduated in 1874 from the Cincinnati College of Medicine and Surgery, where he was professor of gynæcology and abdominal surgery (1882–96). After 1902 he held the chair of clinical gynæcology in the Medical College of Ohio (University of Cincinnati). In 1898 he was president of the American Association of Obstetricians and Gynæcologists and in 1900 of the American Medical Association. In 1908 Reed was made Chevalier of the French Legion of Honor. His writings include: *Textbook of Gynecology* (1900; 2d ed., 1904); *Diseases of Women* (1913); *Marriage and Genetics* (1913).

REED, SIR EDWARD JAMES (1830–1906). A British naval engineer, born near Sheerness. He was educated at the School of Mathematics and Naval Construction at Portsmouth and became secretary of the Institution of Naval Architects. While head of the Board of Construction of the Admiralty (1863–70), he instituted the reconstruction of the British navy. In 1886 Gladstone appointed him Lord of the Treasury. He was a member of Parliament for Pembroke in 1874–80 and was returned for Cardiff in 1880–95 and again in 1900. He published: *Our Ironclad Ships* (1869); *Letters from Russia in 1875* (1876); *The Stability of Ships* (1884); and, in collaboration with Admiral Simpson, *Modern Ships of War* (1888).

REED, ELIZABETH (ARMSTRONG) (1842–1915). An American Oriental scholar, born at Winthrop, Me. She was married to Hiram V. Reed in 1860 and was the mother of Myrtle Reed (q.v.). In 1893 she was chairman of the Woman's Congress of Philology at Chicago and in 1896 became an editor of the *Course of Universal Literature*. For four terms she was president of the Illinois Woman's Press Association. She received honorary degrees from Northwestern and Illinois Wesleyan universities and Bethany College. Mrs. Reed was author of *The Bible Triumphant* (1866); *Hindu Literature: or, The Ancient Books of India* (1891); *Persian Literature, Ancient and Modern* (1893); *Primitive Buddhism: Its Origin and Teachings* (1896); *Daniel Webster: A Character Sketch* (1899); *Hinduism in Europe and America* (1914).

REED, ISAAC (1742–1807). An English biographer and Shakespearean editor, born in London, the son of a baker. His first notable book, *Biographia Dramatica* (2 vols., 1782), reedited (3 vols., 1811) by Stephen Jones, is still valuable. In 1785 Reed revised an edition of Shakespeare published originally by Dr. Johnson and George Steevens (q.v.). After Steevens's death he used the latter's notes in preparing a 21-volume edition (1803; reprinted, 1813). This is known as the "first variorum" Shakespeare. Consult E. Dowden, *Essays Modern and Elizabethan* (London, 1910).

REED, JAMES A. (1861–). An American legislator. He was born near Mansfield, Ohio, but was taken as a child to Linn Co., Iowa. In that State he was educated at Coe College and was admitted to the bar in 1885.

After practicing law for two years at Cedar Rapids, Iowa, he moved in 1887 to Kansas City, Mo., where he became a leader in Democratic politics. He served as prosecuting attorney of Jackson Co., Mo., from 1898 to 1900 and was then mayor of Kansas City until 1904. Reed was a delegate to the Democratic national conventions of 1908 and 1912, was elected United States Senator for the term 1911–17, and served as member of the executive committee of the Democratic National Committee after 1912.

REED, JOHN OREN (1856–1916). An American physicist and university dean, born at New Castle, Ind. In 1885 he graduated from the University of Michigan, where, after studying at Harvard (1891–92), he was instructor (1892–94), assistant professor (1894–99), junior professor (1899–1905), and professor of physics. He was also dean of the summer session from 1899 to 1908 and of the Department of Literature, Science, and the Arts after 1907, and director of the Physical Laboratory after 1909. He took the degree of Ph.D. at Jena in 1897. His publications include: *A Manual of Physical Measurements* (1902; 3d ed., 1912), with K. E. Guthe; *College Physics* (1902); *College Physics* (1911), with K. E. Guthe; *High School Physics* (1913), with W. D. Henderson.

REED, JOSEPH (1741–85). An American patriot of the Revolutionary period. He was born at Trenton, N. J., and graduated at the College of New Jersey, now Princeton, in 1757. From 1763 to 1765 he studied law in England. He then began practice at Trenton and in 1767 became Deputy Secretary of New Jersey. On his return in 1770 from a second visit to England, where he married a daughter of Dennis Deberdt, the agent of Massachusetts in England, he removed to Philadelphia, served on the Committee of Correspondence, and was President of the Second Pennsylvania Provincial Congress in 1775. In 1775 he served as a delegate to the Continental Congress and became Washington's secretary and aid-de-camp. He was Adjutant General during the New Jersey campaign. In 1777 he declined the posts of Chief Justice of Pennsylvania and Commissioner of Indian Affairs and a promotion to the rank of brigadier general and remained in the army as a volunteer without pay, serving with credit in the battles of Brandywine, Germantown, and Monmouth. He was a member of the Continental Congress in 1778 and signed the Articles of Confederation. He was president of the Pennsylvania Supreme Executive Council from 1778 to 1781, in which capacity he helped to suppress the revolt of the Pennsylvania line in the latter year. He had previously caused the trial of Arnold for maladministration. During his administration he aided in founding the University of Pennsylvania and advocated the gradual abolition of slavery. Reed died March 5, 1785. Consult W. B. Reed, *The Life and Correspondence of Joseph Reed* (2 vols., Philadelphia, 1847). Consult also George Bancroft, *Joseph Reed: An Historical Essay* (New York, 1867), in which Reed is presented in an unfavorable light.

REED, MYRTLE (1874–1911). An American author, daughter of Elizabeth Armstrong Reed. She was born in Chicago, where she graduated from the West Division High School. In 1906 she was married to James Sydney McCullough. Among her books, some of them very popular, are: *Love Letters of a Musician* (1899); *Lavender and Old Lace* (1902; new ed., 1907); *Pickaback Songs* (1903); *The Master's Violin* (1904); *A Spinner in the Sun* (1906; new ed., 1909); *Old Rose and Silver* (1909); *Master of the Vineyard* (1910; new ed., 1911); and, posthumously published, *Threads of Grey and Gold* (1913).

REED, THOMAS BRACKETT (1839–1902). An American lawyer, political leader, and parliamentarian, born at Portland, Me., Oct. 18, 1839. He graduated at Bowdoin College in 1860; emigrated to California, where he taught school, in the meantime devoting his spare moments to the study of law; returned to Portland in 1864, and was appointed paymaster in the United States navy, in which capacity he served until his honorable discharge in November, 1865. The same year he was admitted to the bar and began the practice of law at Portland. In 1868–69 he was a member of the Lower House of the Maine Legislature and in 1870 sat in the State Senate. He was Attorney-General of Maine in 1870–72 and solicitor of the city of Portland in 1874–77. Elected as a Republican to Congress in 1876, he served for many consecutive years. In 1889 he was chosen Speaker of the House. Again in 1895 and in 1897 he was elected Speaker, but in 1899 he resigned his seat in Congress and entered upon the practice of law in New York City. As Speaker of the National House of Representatives, he made a notable innovation upon the parliamentary procedure of that body by adopting the practice of counting as present those members of the opposition who, though physically present, refused to vote in order to prevent a quorum. This innovation created a storm of opposition in the House and was denounced as revolutionary. His rulings, however, were adopted by the House in 1890. The practice was soon acquiesced in by the Democrats, and it became a permanent part of the procedure of the Lower House. Moreover, he developed an organized committee system, making the majority of the Committee on Rules consist of the Speaker and chairman of the committees on Ways and Means and Appropriations. In 1896 Reed was a prominent candidate for the Republican nomination for the presidency, but was defeated by William McKinley. After the war with Spain Reed broke with the administration on the issue of imperialism. He died at Washington Dec. 7, 1902. Reed was a remarkable personality, an able parliamentarian, and an efficient speaker, his addresses often being enlivened by rare wit and humor. He published *Reed's Rules* (1894) and edited with others a *Library of Modern Eloquence* (10 vols., 1901). Consult H. B. Fuller, *Speakers of the House* (Boston, 1909), and S. W. McCall, *Life of Thomas B. Reed* (Boston, 1914)

REED, WALTER (1851–1902). An American army surgeon, sanitarian, and bacteriologist, born in Gloucester Co., Va., Sept. 13, 1851. He received his medical education at the University of Virginia and at University Medical College, New York (M.D., 1869). After gaining experience in several hospitals in New York and Brooklyn, he was appointed assistant surgeon in the army in 1875 and in 1890 was assigned to duty in Baltimore, where he remained a year. During this period he studied bacteriology under Prof. William H. Welch (q.v.) of Johns Hopkins. Appointed curator

of the Army Medical Museum, Washington, in 1893, Reed established a laboratory where he gave instruction in bacteriology to the young officers studying in the newly established Army Medical School. In addition he did much original work in bacteriology and in the conduct of special sanitary inspections and investigations. In 1898 he was placed at the head of a board of which Dr. Victor C. Vaughan and Dr. Edward O. Shakespeare, of Philadelphia, were the other members, to investigate the epidemic occurrence of typhoid fever among the United States troops encamped, especially at Chickamauga, at the opening of the Spanish-American War. The report of the committee was of the highest interest and added much to the knowledge of the disease. In 1897 Reed, with Dr. James Carroll, demonstrated the fallacy of the claim of Sanarelli that the *Bacillus icteroides* was the causative agent of yellow fever, and in 1900 he went to Havana at the head of a commission to investigate the etiology of the same disease, the other members being Dr. James Carroll, Dr. Jesse W. Lazear, and Dr. Aristides Agramonte. He demonstrated that yellow fever is transmitted from man to man only by the bite of mosquitoes of a certain variety (*Stegomyia fasciata*, or *calopus*), which have become infected by previously biting persons sick of yellow fever. The work of this commission is remarkable for the accuracy and completeness of its experimental work, the devotion with which its members exposed themselves (two of them having submitted to experimental inoculations with infected mosquitoes), and for the far-reaching importance of their conclusions. In 1901, the investigation completed, Major Reed returned to Washington, where he became professor of bacteriology in the Army Medical School and of pathology and bacteriology at Columbian (later George Washington) University. Besides his work in yellow fever and typhoid, his investigations in erysipelas and cholera should be mentioned. Reed died Nov. 22, 1902, after an operation for appendicitis. In 1893 he had been promoted first on the list of majors of the Medical Department of the United States Army, and the Secretary of War had recommended to Congress his promotion by a special act to the rank of colonel. He was buried at Arlington. Congress granted to his widow a pension of $125 a month. Consult H. A. Kelley, *Walter Reed and Yellow Fever* (Garden City, N. Y., 1906), and W. D. McCaw, *Walter Reed: A Memoir* (Washington, 1907). See INSECTS, PROPAGATION OF DISEASE BY.

REED, WILLIAM BRADFORD (1806–76). An American politician and journalist, born in Philadelphia. After graduating at the University of Pennsylvania in 1825 he went to Mexico as private secretary of Joel R. Poinsett, studied law, was elected State Attorney-General (1838), was made professor of American history at the University of Pennsylvania (1850), in 1857 became Minister to China, where he negotiated the Treaty of June, 1858, and on his return (1860) was active in Democratic politics and in New York journalism. For a time he was American correspondent of the London *Times*. Reed published many controversial and historical pamphlets and contributed essays chiefly to the *American Quarterly* and the *North American Review*. He wrote also an excellent *Life and Correspondence of Joseph Reed*, his grandfather (1847), and *Life of Esther de Berdt*, afterward Esther Reed, his grandmother (1853).

REED'BIRD'. The name in the Middle States of the bobolink (q.v.). In England the name belongs to a warbler, the reed wren (*Acrocephalus streperus*), and to the reed bunting (q.v.).

REED'BUCK', or **REITBOK,** rēt'bŏk'. A small goatlike antelope of central and southern Africa (*Cervicapra arundineum* or *Redunca redunca*), the males alone of which are provided with horns, which vary greatly in size and shape. It is never found far from water, is slow and unsuspicious, and hence is becoming rare. Consult Sclater and Thomas, *Book of Antelopes* (London, 1894–1900).

REED BUNTING, or SPARROW. A small dark-colored European finch (*Emberiza schœniclus*), fond of marshes and wet meadows, which is common throughout Europe and is frequently called black-headed bunting. See Plate of BUNTINGS AND GROSBEAKS.

REED'ER, ANDREW HORATIO (1807–64). The first Governor of Kansas Territory. He was born at Easton, Pa., was educated at Lawrenceville, N. J., studied law, and practiced with great success at Easton. He became influential in the Democratic party and in 1854 was appointed Governor of the new Kansas Territory by President Pierce. It was expected by those who had secured his appointment that he would assist in the work of making Kansas a slave State, but this, owing perhaps to the lawless behavior of the border ruffians from Missouri, he did not do, and instead became favorable to the Free-State party in the Territory. As a result of his attitude a delegation of Democrats, headed by Jefferson Davis, demanded his removal. With this demand the President complied, and Reeder was removed from office after a tenure of a little more than a year. He then became one of the leaders of the Free-State party, and in September, 1855, was nominated as delegate to Congress by the Big Springs convention. A little later he was again chosen delegate by the same party, but was never allowed to serve. In the following July he was elected United States Senator by the Legislature organized under the Topeka constitution, but as Kansas was not admitted to statehood, he was not permitted to take his seat. Not long afterward he returned to the East, and was received with great enthusiasm by the opponents of slavery. Upon the outbreak of the Civil War he was appointed a brigadier general, but felt himself too old and infirm to serve. Consult Charles Robinson, *The Kansas Conflict* (New York, 1892), and L. W. Spring, *Kansas* (Boston, 1892).

REED FISH. One of the two ganoid fishes (the other being the bichir, q.v.) which constitute the sole remaining representatives of the order Crossopterygii, which was of great importance in ancient times. This modern ganoid is a small fish dwelling in the rivers on the west coast of Africa, and has an elongated, terete body with a curiously divided dorsal fin and no pelvic fin. There is only one species (*Calmoichthys calibaricus*), which lives in deep pools and apparently buries itself in the mud at the bottom, where it feeds on fishes and other aquatic animals.

REED INSTRUMENTS. See REED.

REED MACE. A plant. See TYPHA.

REEDS'BURG. A city in Sauk Co., Wis., 51 miles by rail northwest of Madison, on the Chicago and Northwestern Railroad (Map: Wis-

consin, D 5). It has a Carnegie library and a training school for teachers. Among the industrial establishments are a milk condensery, woolen, planing, and flour mills, machine shops, creameries, and a canning factory. Reedsburg is a large potato market, and ships also apples, live stock, and creamery products. Pop., 1900, 2225; 1910, 2615.

REEF (Dutch *rif;* probably connected with Icel. *rifa*, fissure, from *rīfa*, to split, Eng. *rive*). A barrier of rock or sand extending along the shore of an island or a continent. The most common type of a rock reef is that formed by coral organisms which flourish in the shallow portions of tropical seas. (See CORAL ISLAND AND CORAL REEF.) The sediment carried seaward by rivers and the sands beaten up by waves accumulate along the seashore as sand reefs, inclosing long, narrow lagoons. See BAR.

REEF. See SAIL.

REEL (AS *rēol, hrēol*, Icel. *hræll, ræll*, Gael. *ruidhil*, weaver's reel). A lively, gliding dance whose origin is probably Celtic, though its resemblance to a Danish national dance has led many to ascribe it to Scandinavian sources. It is usually danced by two couples, but admits of a greater number. The music is in general written in eight-bar phrases in common time of four crotchets in a measure, but sometimes in jig time of six quavers. The principal characteristic of all reel figures is a circular movement during which the performers face each other and describe a series of figures of eight. The strathspey (q.v.) is merely a slow form of the reel.

REËNTRY. The act of entering into possession of lands in the exercise of a right expressly or impliedly reserved to a lessor or grantor in a lease, deed, or other conveyance upon condition. In order to take advantage of a right of reëntry, a person should first demand payment or compliance with the terms of the lease or conveyance, and upon a refusal or neglect to do so, enter peaceably, if he can, but otherwise he must proceed at law. Right of reentry may be waived by the person entitled to exercise the same, in which case the estate is unaffected by the breach of condition. See CONDITION; ENTRY; WAIVER.

REES, JOHN KROM (1851–1907). An American astronomer, born in New York City and educated there at Columbia (College and School of Mines). After teaching at Washington University, St. Louis (1876–81), he became instructor in geodesy and astronomy at Columbia (1881) and professor of astronomy (1892). He had witnessed the solar eclipse of 1878 at Fort Worth and published a report thereon; and in 1884 he published *Observations of the Transit of Venus, December 6, 1882.* He was a member of the American Meteorological Society and wrote on international time systems and on variation of latitude, especially that of New York City. In 1900 he was made Chevalier of the Legion of Honor in recognition of services as juror in the department of instruments of precision at the Paris Exposition. Professor Rees was intimately connected with L. M. Rutherfurd in work on celestial photography and was a delegate to the Astronomical Congress on Photography. He retired under the Carnegie Foundation in 1906.

REEVE. See RUFF; PHEASANT.

REEVE (AS. *gerēfa*, probably from *ge-*, generalizing prefix + **rōf*, OHG. *ruova*, Icel. *rōf*, number, or from *rōf*, famous, Goth. *hrōps*, OHG. *ruof*, Ger. *Ruf*, outcry, AS. *hrōpan*, to cry out). The name given in England, especially in Anglo-Saxon times, to various officials. The reeve was ordinarily the presiding officer of a district, and was known by his district, e.g., *tūngerēfa*, the reeve of the township; *scīrgerēfa*, the reeve of the shire (our modern sheriff). In later times the reeve is prominent in constitutional history, since he and four men from each township attended the great hundred courts held by the sheriffs twice a year. Furthermore, it was the reeve and four men from each township on the royal demesne who were summoned to the Council of St. Albans in 1213, this being the first instance in which the commons were represented at a Great Council. Consult William Stubbs, *Constitutional History of England*, vol. i (6th ed., Oxford, 1897).

REEVE, CLARA (1729–1807). An English novelist, daughter of William Reeve, a curate in Suffolk. Her writing was done at Colchester, Essex. In 1777 appeared *The Champion of Virtue: A Gothic Story*, reissued the next year with its title changed to *The Old English Baron.* This romance is of significance as a link between Horace Walpole's *Castle of Otranto* and the romances of Mrs. Ann Radcliffe (qq.v.). In criticism Miss Reeve published the *Progress of Romance* (1785), an account of contemporary fiction Consult H A. Beers, *History of English Romanticism in the Eighteenth Century* (New York, 1899).

REEVE, HENRY (1813–95). An English man of letters, born at Norwich and educated at Geneva and Munich. He traveled extensively and met the leading literary people of his day. From 1843 to 1887 he was registrar of the Privy Council and from 1855 until his death he was editor of the *Edinburgh Review.* He translated De Tocqueville's *Democracy in America* (1835–40) and Guizot's *Washington* (1840), edited Greville's *Journal of the Reigns of King George IV and William IV* (1874), and wrote *Royal and Republican France* (1872) and *Petrarch* (1878).

REEVE, RICHARD ANDREWS (1842–). A Canadian physician. He was born in Toronto and was educated at Toronto University and in medicine at Queen's University, Kingston. He was assistant surgeon of the Toronto Eye and Ear Infirmary in 1867–72 and later was lecturer on ophthalmology and otology in the medical faculty of Toronto University, of which he was dean from 1896 to 1908. He was elected president of the Canada Medical Association, and in 1907 was appointed head of the service, eye department, of Toronto General Hospital. In 1905 he was elected president of the British Medical Association, presiding at its meeting in Toronto in 1906. The next year he was elected a life vice president of the association.

REEVE, TAPPING (1744–1823). An American lawyer and jurist, born at Brook Haven, Suffolk Co., Long Island. He graduated at Princeton in 1763, was a tutor there from 1767 to 1770, and in 1772 established himself at Litchfield, Conn., in the practice of law. He was an ardent patriot during the Revolution, was a member of several important local committees of safety and defense, and served as a recruiting officer. Shortly after the close of the war he opened at Litchfield a law school, which for a number of years was the best-known and most successful institution of the sort in the country. This school he conducted alone

until 1795, and then in association with James Gould until 1820. Some of the most celebrated members of the profession in America received their education there. Reeve was a strong Federalist, but except for brief terms in the Connecticut Legislature and council, his services were all of a judicial nature. In 1798 he was elected a judge of the Connecticut Supreme Court, and remained on the bench for 16 years, becoming Chief Justice shortly before his retirement in 1814. His publications include *The Law of Baron and Femme; of Parent and Child; of Guardian and Ward; of Master and Servant, etc.* (1816; since republished in many editions) and *A Treatise on the Law of Descent* (1825).

REEVES, rēvz, ARTHUR MIDDLETON (1856–91). An American philologist and historian, born at Cincinnati, Ohio. He graduated in 1878 from Cornell University, where he devoted himself to the study of languages, especially Old Norse and the sagas. In 1879 he traveled in Iceland, studying Icelandic, Old Norse, the sagas, and ancient manuscripts, and thereafter till 1890 he spent much time in Europe in scholarly investigation. He was killed in a railroad accident. Reeves wrote *The Finding of Wineland the Good* (1890; new ed., 1895), with phototype plates of the vellum manuscripts of the sagas and biography and correspondence of the author, an important work on the discovery of America. With N. L. Beamish and R. B. Anderson he wrote *The Norse Discovery of America* (posthumous, 1906).

REEVES, MRS. HENRY (HELEN BUCKINGHAM MATHERS) (1853–). An English novelist, born at Misterton, Somersetshire. She was educated at Chantry School, near Frome In 1876 Miss Mathers married Henry Albert Reeves, a London orthopædic surgeon (died 1914). Her first novel, *Comin' thro' the Rye* (1875), gained wide attention. It was followed by the popular *Cherry Ripe* (1877), *My Lady Green Sleeves* (1879), and several others, including novelettes, *The Land o' the Leal* (1878) and *As he Comes up the Stair* (1878). Among her later novels are: *A Man of To-Day* (1894); *The Lovely Malincourt* (1895); *The Sin of Hagar* (1896); *Bam Wildfire* (1898); *Becky* (1900); *Tally Ho!* (1906); *Pigskin and Petticoat* (1907); *Love the Thief* (1909).

REEVES, JOHN SIMS (1822–1900). An English tenor, born at Woolwich. He studied under J. B. Cramer, T. Cooke, and other noted artists and appeared in public as an operatic barytone at Newcastle in 1839. After further study in Paris he appeared at Milan in the tenor part of Edgardo in *Lucia di Lammermoor*, when his singing electrified the audience. At Drury Lane in 1847 he was immediately recognized as the foremost living English tenor and was engaged in 1848 at Her Majesty's Theatre. In 1851 he was equally successful as first tenor at the Italian opera in Paris. He retired from the stage and became a professor in the Guildhall School of Music in 1892, but on account of financial reverses returned to the concert platform and in 1896 made a successful tour in South Africa He wrote *On the Art of Singing* (1900).

REEVES, WILLIAM PEMBER (1857–). A British economist, born in Canterbury, New Zealand. He was educated at Christchurch, New Zealand, studied law, but, abandoning this profession for journalism, became editor of the Canterbury *Times* and later of the Lyttelton *Times*. He was a member of the New Zealand Parliament in 1887–96 and Minister of Education, Labor, and Justice in 1891–96. From 1896 to 1905 he was Agent General of New Zealand and then for four years High Commissioner. In 1908 he became director of the London School of Economics. Reeves's activity in the politics of New Zealand gave particular value to his books, *The Long White Cloud: A History of New Zealand* (1898; 2d ed., 1900) and *State Experiments in Australia and New Zealand* (1902), and to his contributions to Kennedy's *Story of the Empire* (1897) and Ashley's *British Dominions* (1911). In verse he wrote *New Zealand and Other Poems* (1898) and *In Double Harness* (1891), with G. P. Williams

REF'ERENCE, REF'EREE' (from Lat. *referre*, to refer, bear back, from *re-*, back again, anew + *ferre*, to bear, carry). In law, reference is the sending of issues or questions arising in a legal proceeding to a competent attorney as referee, to be tried or examined by him in the place and stead of a judge and jury. A reference may be voluntary or compulsory. It has been held in many of the United States that in certain cases compulsory references are constitutional. Actions involving long and complicated accounts and divorce actions, where privacy and secrecy are deemed desirable in the public interest, are those most frequently tried before referees. Referees are usually appointed only as the occasion arises, but under the United States Bankruptcy Act standing referees are appointed by the courts. The findings of a referee are submitted in a report which is filed with the court ordering the reference, and on its confirmation by that court a judgment may be entered in accordance with the decision of the referee. This judgment may be reviewed on appeal by an appellate court. The fees and expenses of a reference are usually large, and on that ground litigants frequently oppose a motion to send a case to a referee. Referees correspond to masters in chancery, appointed by courts of equity, but in code States referees hear both legal and equitable actions. See ARBITRATION; COURT, TRIAL.

REF'EREN'DUM (Neo-Lat. nom. sing neut. of Lat. *referendus*, to be referred, gerundive of *referre*, to refer, bear back). The term applied to the practice of submitting laws to the electorate for approval or rejection. In the application of the referendum the law is first formulated by the legislative body or the constituent assembly and is then submitted to the electorate. The logical complement of the referendum is the initiative, by means of which the people are enabled to draw up their own measures and have them voted on without the intermediation of the Legislature. By this method a petition signed by a certain proportion of the voting constituency is presented to the Legislature requesting that a certain measure be submitted to the popular vote. This the Legislature is bound to do without change in the measure, although it may submit an alternative measure to be voted on at the same time. In Switzerland, in every canton of the Confederation except Fribourg, the referendum in one form or another is established by law. In about one-half of the cantons the referendum is optional or facultative, i.e., the laws are submitted to the popular vote only when submission by petition of a certain per cent of the voting con-

stituency is demanded. In the others it is obligatory, i.e., the laws must be submitted without petition. It is always obligatory in the case of proposed constitutional changes, whether cantonal or federal. In the domain of ordinary legislation it is usually employed only in the case of important measures of a general character. Since 1874 the referendum has been a feature of the government of the Confederation. The constitution provides that upon the demand of eight cantons or 30,000 citizens any federal law of general application must be submitted to the people. During the first 19 years after its adoption by the federal government 20 laws out of a total of 150 were thus submitted, 14 being ratified and 6 rejected. The initiative was adopted by the federal government in 1891 as a means of introducing proposals to revise the constitution. See SWITZERLAND, *Government*.

In the United States the referendum is employed in one form or another in every State and municipality. Early in the country's history it became an established principle of American law that all State constitutions and proposed amendments should depend for their validity upon the ratification of the electorate at the polls. From this it was but a step to the position that propositions to call constitutional conventions should be made a subject for the referendum, and this practice became in time well established. Not only has the referendum been employed in the United States for the adoption of organic laws, but it has been used quite as often or more often in the enactment of statutes. It was first employed to determine the question of incorporation of towns, the organization of school districts and counties, the incurring of loans, the undertaking of public improvements, etc. The referendum has never been employed by the Federal government for general purposes, although an Act of Congress of 1846 providing for a recession of a part of the District of Columbia to Virginia was submitted to a vote of the qualified voters of the District.

The question early arose as to whether the use of the referendum was permissible where not expressly authorized by the State constitution. From 1826 to 1847 the courts of various States upheld the constitutionality of legislative acts providing for the use of the referendum on the ground that it was not a delegation of legislative power, but simply popular coöperation. Beginning with a decision of the Delaware Supreme Court in 1847, several opinions were given against this view which had the effect of inducing the incorporation of provisions in the constitutions authorizing the referendum. As an instrument of ordinary legislation the referendum in America dates from the South Dakota Law of 1898. Between 1898 and 1913, 15 additional States, chiefly in the Middle and Far West, incorporated the referendum into their lawmaking process. See ELECTION; ELECTORAL REFORM; INITIATIVE; LEGISLATION; POPULAR GOVERNMENT; PRIMARY ELECTION; RECALL.

Phelps (comp.), *Selected Articles on Initiative and Referendum* (3d ed., White Plains, N. Y., 1914).

REFINEMENTS OF ARCHITECTURE. In the year 1814 the architect Allason, studying the ruins of the Parthenon (q.v.) at Athens, for the first time observed that the arrises or edges between the channelings of the columns described each a delicate convex curve and that the tops of the stylobate steps were not perfectly horizontal but slightly convex upward. These observations were confirmed later by Cockerell and Haller, verified by C. F. Penrose in 1846, and were extended and developed by him, by Ziller, and by others. It was discovered that the Parthenon columns leaned inward and were separated by subtly varied spacings and that friezes and corona facias leaned slightly outward. It was observed also that the cornices surrounding the forecourt of the temple of Medînet Habu in Egypt all described delicate curves with the convex inward. Similar curves and leans having been verified in other Greek buildings, it was evident that they were made intentionally; and various theories were propounded to account for such careful deviations from mechanical straightness, verticality, and regularity. The more commonly adopted theories were that they were intended to correct an apparent concavity in long straight lines; that they counteracted certain optical illusions; that they gave vitality and vigor to designs which if too mechanically perfect would appear cold and hard.

In 1874 W. H. Goodyear first published in *Scribner's Monthly* an account of his observations of certain puzzling irregularities in the lines of Pisa Cathedral and his conviction that they were intentional and not accidental. Since that date, in numerous expeditions to Europe, several of these being made in behalf of the Brooklyn Institute of Arts and Sciences, Mr. Goodyear has accumulated a vast array of data relating both to classic monuments and to those of the Middle Ages, especially in Italy and France, tending to show that the Greek tradition survived in various modified forms until at least the sixteenth century, and that innumerable singular curves, leans, and other deviations from mechanical regularity, previously unobserved or attributed to accident, settlings, or careless execution, were intentional and purposeful. Mr. Goodyear's conclusions, hotly contested by not a few able architects and archæologists, have been widely accepted, nevertheless, and to their support an immense mass of evidence by photographs, supplemented by careful measurements, has been presented to the public. The most important phenomena thus established are:

1. Bends or curves in plan.
2. Widenings in the nave eastward.
3. Pitch or slope in the pavement.
4. Convexity upward of lines normally horizontal.
5. Curvature of vertical lines.
6. Widening upward of the nave, the opposite vaulting shafts leaning apart, either in delicate curves or in straight lines.
7. Variations in spacing and dimensions of apparently similar features—arches, piers, etc.
8. Forward leaning of façades.

The general explanation offered for these irregularities and refinements is that some (e.g., 2, 3, 6, 8) were designed to correct or to en-

hance perspective effects or illusions; others (e.g., 1, 4, 5, 7) to avoid the deadness of mechanical regularity; while 1 may possibly have had also some symbolical value.

In consequence of these observations occasional efforts have been made in modern work to introduce similar refinements, as in certain leans in the cathedral of St. John the Divine in New York and upward convexity in the long steps of the south court of Columbia University. The subject deserves far more careful study by practicing architects than it has generally received. Consult: W. H. Goodyear, "Recently Published Measurements of the Pisan Cathedral," in *American Journal of Archæology*, second series, vol. xiv (Baltimore, 1910); id., "Mediæval Architectural Refinements," in *Yale Review* (New Haven, 1912); id., *Greek Refinements* (ib., 1912); various memoirs of the Brooklyn Institute Museum (Brooklyn, N. Y., 1902 et seq.); also F. C. Penrose, *Investigation of the Principles of Athenian Architecture* (London, 1857).

REFINING OF METALS (from Lat. *re-*, back again, anew + Eng. *fine*, from OF. *fin*, probably from Lat. *finitus*, finished, p.p. of *finire*, to bound, limit, from *finis*, boundary). The process is essentially the increasing of the purity of metal which has already been put into bullion or other alloyed form. Refining does not necessarily have as its immediate object the obtaining of the metal in an absolutely pure state. In many cases a refining process is carried out on the base bullion produced at ore-reduction works, the result being a richer bullion which may be further treated at special refining plants. The expression "refining" is used particularly with reference to silver and gold, often referring to the separating or parting of the two metals in bullion containing only silver and gold. The pure metals obtained are known as fine silver and fine gold. Refining in the metallurgy of iron is commonly understood to mean the partial decarburization and purification of pig in the open-hearth furnace. See COPPER; GOLD; IRON AND STEEL; LEAD; NICKEL; SILVER; TIN.

REFLECTING ANEMOMETER. See NEPHOSCOPE.

REFLEC'TION (Lat. *reflexio*, a bending back, from *reflectere*, to bend back, from *re-*, back again, anew + *flectere*, to bend). A general phenomenon observed in the case of all kinds of wave motion. If there are two media separated by a bounding surface, in which the trains of waves of the particular kind have different velocities, waves traveling in one medium and meeting this bounding surface will suffer reflection, either total or partial. This is illustrated in aërial waves by the phenomenon of echoes and in ether waves by the common use of mirrors of various kinds. The laws of regular reflection are that the incident and reflected rays make equal angles with the line drawn perpendicular to the surface of the point of incidence and that the two rays and this line lie in a plane. (See LIGHT.) To reflect a train of waves the reflecting body must have a size larger than the wave length of the waves; a pile rising above the surface of a lake may reflect ripples, but long waves pass around it; a pane of window glass will reflect aërial waves characteristic of a shrill sound and allow others to pass; a small particle of matter floating in the air may reflect such short ether waves as produce the sensation of blue light, but allow to pass those so long as to produce red. If the bounding surface between the two media is rough, i.e., has inequalities which are comparable with the lengths of the waves, they will be scattered by these and will be diffusely reflected, e.g., ground-glass surfaces.

REFLECTOSCOPE. See PROJECTION APPARATUS.

REFOR'ESTA'TION. See FORESTRY.

REF'ORMA'TION (Lat. *reformatio*, from *reformare*, to form anew, from *re-*, back again, anew + *formare*, to form, from *forma*, shape). In law, the rectification or amendment of contracts or other legal instruments pursuant to the judgment or decree of a court of equity. If a term is incorporated into a written instrument by mistake so that it does not represent the real intention of the parties, such intention, by reason of the parol-evidence rule (see EVIDENCE), cannot be shown in any proceeding at law founded upon the written instrument. Courts of equity, however, will give relief from the consequences of such a mistake by compelling the cancellation and surrender of the written instrument and the execution of a new instrument to conform to the actual intention of the parties. The ordinary rules governing equitable proceedings apply in proceedings to reform written instruments; and the court will give such incidental relief as is necessary to carry out the main purposes of the proceeding. See CONTRACT; EQUITY; EVIDENCE; MISTAKE; RESCISSION.

REFORMATION, THE PROTESTANT. By this term is designated the great revolution which took place in the sixteenth century against certain doctrines and practices of the Roman Catholic church. Though primarily a religious revolution which attacked the universal supremacy of the Pope and ended religious unity in Christendom, it was also accompanied by changes in the political, social, and intellectual conditions of western Europe. Like the Renaissance (q.v.), which preceded it, and the French Revolution, which followed it, the Protestant Reformation was one of the three great revolutionary waves of the advancing tide of modern civilization. Though it is more accurately designated the Protestant Revolution, its leaders were often called reformers and it led to definite reforms within the Catholic church; it is therefore convenient to accept the long-established usage of speaking of the Protestant Reformation rather than of the Protestant Revolution. It is considered below under six headings: (1) Conditions Preceding the Reformation out of which the movement developed; (2) Lutheran Reformation in Germany and Scandinavia; (3) Calvinistic Reformation in Switzerland, France, Holland, and Scotland; (4) Reformation in England; (5) Minor Sects; (6) General Results of the Reformation.

Conditions Preceding the Reformation. The Reformation dates from the year 1517, when Martin Luther (q.v.) challenged some of the papal assertions in his famous *Ninety-five Theses*. The *Theses* spread like wildfire. Luther tells us that the printing presses could not meet the demands for them. The explanation of their popularity can be understood only by noting certain conditions which had long existed in Europe and which in the beginning of the sixteenth century combined to produce the Protestant Revolution.

An almost continual conflict, since the time

when the Empire was revived by Otto I (q.v.) in the year 962, had been taking place between popes and emperors. This conflict had generally resulted in victory for the papal side, but created a bitter antagonism between Rome in the south and Germany in the north. To this antagonism were added in the fourteenth and fifteenth centuries the beginnings of that spirit of nationality which has grown steadily and powerfully as a source of discord between peoples, until in the twentieth century it became one of the main causes of the World War of 1914. The national resentment against papal officials, papal taxation, and papal interference began to show itself in one country after another. In England the statutes of Mortmain (1279), of Provisors (1351), and of Præmunire (1393) greatly reduced the power of the Church to withdraw land from the control of the civil government, to make appointments to ecclesiastical offices, and to exercise judicial authority. John Wiclif (1324–84) boldly attacked the papacy itself, striking at the practices of indulgences, pilgrimages, and the worship of saints, as well as at the fundamental doctrine of transubstantiation. He denounced the teaching and character of the ordained priests and advocated in their stead "simple priests" living according to the Gospels. To reach the common people and to foster a higher spiritual life among them, he translated the Bible and prepared sermons in English. Wiclif's teachings, carried by wandering students according to mediæval fashion from one university to another and transported in other ways, spread into Bohemia. Here they found a powerful advocate in John Huss (1369–1415). Huss was arrested, condemned at the Council of Constance, delivered over to the secular arm, and burned at the stake. His death, however, did not silence his protest. On the contrary it raised a religious and social national revolt in Bohemia which was a direct precursor of the revolt in Germany in Luther's day. It was not suppressed until the Pope was forced to make concessions to the Hussites. Wiclif and Huss were forerunners of Luther.

The papacy itself in the fourteenth and fifteenth centuries had in some cases fallen in practice from the high ideals of Gregory VII and Innocent III. It had become an object of easy attack on account of the greed, immorality, and ignorance of numbers of its officials all through the hierarchy. Though there were unquestionably a great many good pastors and faithful monks, there is evidence from churchmen themselves that too many of their own number lived lives which were a cause of scandal and indignation to simple and devout Christians. The "Babylonian captivity" of the papacy at Avignon (1305–76) had increased the luxury and expenses of the papal court and consequently increased the pressure of ecclesiastical taxation, the sale of offices, papal tithes, annates, and other forms of financial exaction. This ecclesiastical taxation was resented by both the governments and the common people of the growing nations north of the Alps. The Great Schism (1378–1417), with the spectacle of three antipopes vituperating one another, not only scandalized Europe, but divided the faithful into partisans of one or the other Pope. The Church itself had recognized all these evils and had proposed at the Council of Constance its own "reformation in head and members." But no thorough reform was accomplished at that time.

The revival of learning in Italy, which was one of the phases of the Renaissance (q.v.), struck down the scholastic system of the mediæval Church and deprived churchmen of that monopoly of learning which they had so long enjoyed. The schools of Vittorino da Feltre and Guarino da Verona, the newly discovered art of printing with movable metal types, and the revival of the classic literatures of Greece and Rome put into the hands of others than Church officials the long unknown stores of human knowledge and the tools for textual criticism. Lorenzo Valla (1406–56) endeavored to prove that the Donation of Constantine, as well as many other documents on which papal claims rested, were forgeries. The Italian humanists, however, seduced by the beauty of the ancient pagan world and the pleasures of Epicurean philosophy, were generally indifferent to reform in the Church. Genuine and effective desire for reform came first from the humanists of the North—Desiderius Erasmus (1466–1536) of Rotterdam, John Colet (1466–1519) and Sir Thomas More (1478–1535) in England, Lefèvre d'Etaples in France, and John Reuchlin (1455–1522) in Germany. These earnest Christians employed the New Learning towards a reform in morals and a more accurate knowledge of the Scriptures. By their scholarly study of the text of the Bible, which was greatly furthered by Erasmus' Greek edition of the New Testament (1516) and by Reuchlin's Hebrew studies on the Old Testament, they laid the foundation on which Luther and Calvin could take their stand when they appealed to the Bible as the source of all authority.

Finally, a revival of interest in religion and an increase of genuine piety in the family life of the common people are noticeable in Germany in the latter decades of the fifteenth century. This found expression in the passion for collecting relics, in the numerous pilgrimages, and in the more frequent sermons, church festivals, and miracle plays. The religious revival found expression also in a silent, sincere, nonecclesiastical religion which is evidenced by the study of the Bible, by the publication of devotional works, and by the formation of devout groups of men and women for study and prayer, such as the Brethren of the Common Life. These German Mystics aimed at the closest union between man and God. Their earlier leaders were Master Eckhart (died 1327), Heinrich Suso (died 1366), Johann Tauler (died 1361), and Thomas à Kempis (died 1471), the famous author of the *Imitation of Christ*. In contrast with humanistic Italy, where the reform movement of Savonarola (q.v.) collapsed completely, it is noteworthy that in Germany the earliest presses printed many more books for family and private devotion and many more editions of the Bible than of the Greek and Roman classics —22 editions of the Psalter in German before 1509, 25 of the Gospels and Epistles before 1518, and 14 versions of the whole Bible in High German and 3 in Low German; these versions, however, were from the Vulgate and were lacking in accuracy and literary merit; they were consequently superseded completely by Luther's masterly translation a few years later.

Lutheran Reformation in Germany and Scandinavia. *Germany.*—The Protestant revolution began in Germany with Martin Luther

(1483–1546) and was considerably influenced by his strong personality. He in turn was the embodiment and exponent of many of the tendencies inherent in the conditions preceding the Reformation. He was a patriotic German, who hated to see Germany drained of her money for the support of foreign Italian officials. On a visit to Rome in 1511 he had seen the worldliness, corruption, and vices into which some of the Renaissance popes had sunk. Though the shock which he then received did not at once convert him into a reformer, it gave great strength and point to his later assault on the papacy. At the University of Erfurt he caught something of the New Learning, and later enjoyed the friendship and assistance of the greatest German scholars, like Melanchthon and Reuchlin. His sensitive nature was deeply impressed with the simple piety of his peasant parents and early surroundings. Overwhelmed by a profound conviction of sin and fear of hell, for 10 long years he struggled to win salvation for himself by his own good works. Gradually, from reading the writings of the German Mystics, and especially from St. Paul's Epistles, he came to believe that salvation, or "justification," could not be won by man's own efforts, but was the free gift of God, to be gained only by faith. "A man is justified by faith apart from the works of the law," said St. Paul (Rom. iii. 28). So justification by faith became the doctrinal starting point of Luther's career and the basis from which he soon attacked the various good works, such as indulgences, recommended by the Church. Besides embodying many of the tendencies of the time, Luther was born and remained a man of the common people; he was therefore able to carry a strong popular movement to success, where earlier reformers had failed.

In 1517 a Dominican monk, named Tetzel (q.v.), came preaching indulgences to Luther's own parishioners near Wittenberg on the Elbe in Saxony. Luther was convinced that this was injurious to the moral and religious life of his fellow townsmen and that Tetzel's sermons as reported to him were full of lies and blasphemies. Therefore on All Saints' eve (Oct. 31), 1517, he posted on the door of the Castle Church at Wittenberg 95 theses challenging the theory and practice of indulgences. At once he found himself a storm centre. By many of the German princes and people he was applauded. By the Roman church he was summoned to submit to authority and be silent. A disputation at Leipzig (1519) with the zealous John Eck revealed the fact that Luther approved some of the doctrines of Huss, who had been condemned and burned as a heretic a century before. Accordingly the Pope issued against Luther a bull of excommunication. When it arrived at Wittenberg Luther, surrounded by the students and professors of the university, marched to a neighboring meadow and cast into a bonfire not only the papal bull itself but also a copy of the Canon Law (Dec. 10, 1520), thus symbolically breaking with the whole system upon which the Roman structure rested. The next year he was summoned before the newly elected German Emperor, Charles V, and the German princes and ecclesiastics assembled in the Diet at Worms (April, 1521). Here he was ordered to recant. Upon his refusal he was declared by Imperial edict to be an outlaw under the ban of the Empire, his writings were prohibited, and his adherents were threatened with extermination, but the edict was never completely enforced. Even the Papal Nuncio, Aleander, wrote that nine-tenths of the Germans cried "Long live Luther" and the other tenth "Death to Rome." After remaining hidden some months with friends at the Wartburg Castle, where he made an accurate and vigorous German translation of the New Testament from the original version in Greek, Luther came forth again to Wittenberg to assume the leadership of the reform movement which bears his name. Henceforth Germany was sharply divided religiously between Catholics and Lutherans. The former were supported by the Emperor, the bishops and abbots, and some of the princes. The latter found adherents in many of the free imperial cities and among the princes of northern Germany. In 1526, at the First Diet of Spires, it was agreed that German princes might adopt Lutheran practices, but at the Second Diet of Spires, in 1529, the Catholic majority rescinded this agreement. The Lutheran minority thereupon protested; thus the first Protestants were Lutherans, but the term was later broadened to include all the new Christian sects which arose out of the revolt from Rome. In 1530, at a diet in Augsburg, the Lutherans drew up a conciliatory statement of their tenets, known as the Augsburg Confession, with the hope that it would prove acceptable to the Emperor and the Catholic party. It was rejected by them, but it remained the basis of the new Lutheran church and creed. Charles V's wars with France and the Turks prevented him from attempting to suppress the Lutherans at once. But after Luther's death in 1546, with the aid of the ambitious Maurice of Saxony, the Emperor took the field against the Lutherans in the so-called Schmalkald War. Though successful at first, he finally had to flee for his life, owing to the treacherous desertion of Maurice of Saxony. The civil religious war was closed by the Peace of Augsburg in 1555. According to its terms each ruler in Germany might choose between either Catholicism or Lutheranism for his territory and might enforce his chosen faith upon all his subjects according to the principle *cujus regio, ejus religio*. This gave toleration to the princes, but not to the people. Lutheranism was at last legally recognized. The idea of the religious unity of Western Christendom under the headship of the Pope was forever abandoned. Lutheranism established itself in northern and northeastern Germany; Catholicism maintained itself in the southeast and along parts of the Rhine valley where strong bishoprics were situated. The Peace of Augsburg also allowed Lutherans to retain all episcopal and monastic lands which they had seized and secularized before 1552, but provided, by the ecclesiastical-reservation clause, that in the future any bishop or abbot who changed his faith should thereby forfeit his office and lands; these were to be reserved for loyal Catholics. In the half century after 1555, during the Catholic reaction, or Counter-reformation (q.v.), many disputes unfortunately arose in regard to the Peace of Augsburg; Catholics and Lutherans differed as to the observance of the ecclesiastical reservation; adherents of the Calvinistic Reformation (see below) demanded for themselves the same legal recognition which the treaty had accorded to Lutherans; and the Emperor was too weak to

enforce the authority of the central government and thereby maintain peace between the religious factions. Out of these conditions came the Thirty Years' War (1618–48), which wrought terrible desolation in Germany until the religious and political questions were finally settled at the Peace of Westphalia (1648).

In the organization of the Lutheran church in Germany the territorial prince became the ecclesiastical head, *summus episcopus*, within his territory, so that there were as many Lutheran church organizations in Germany as there were Lutheran ruling princes. All, however, had virtually the same creed, based on the Confession of Augsburg. Each prince usually exercised his ecclesiastical power of appointment and discipline through a commission or consistory. In general Luther retained all the Roman Catholic service and practices which he did not consider inconsistent with the Bible. Of the seven sacraments he retained only two, baptism and the Lord's Supper. While denying the Roman Catholic doctrine of transubstantiation, Luther did vigorously insist on the literal meaning of the words *Hoc est corpus meum*, and maintained the Real Presence of Christ's body in the bread. Laymen partook of the Lord's Supper in both the bread and the wine. The church services were in the vernacular instead of in Latin, and an increased emphasis was placed on sermons and congregational hymn singing In general attitude of mind the Lutherans tended towards conservatism. They hated the newer sect of Calvinists as dangerous innovators and contemners of the true meaning of the Lord's Supper and as restless political spirits who would involve Germany in revolutions and foreign religious wars.

Scandinavia.—The Lutheran Reformation in its essential features spread rapidly from Germany northward into the Scandinavian lands. It was carried by men who had studied under Luther at Wittenberg or who had been influenced by his writings. A national assembly which met at Copenhagen in 1536 did away with all episcopal authority in Norway and Denmark and invited Luther's friend, Bugenhagen, to come and organize a national Lutheran church on the basis of the Augsburg Confession. In Sweden, as a result of the efforts of the brothers Olaus and Laurentius Petri, a similar Lutheran Reformation was accomplished by the Ordinances Vesterås, adopted by the Swedish Diet in 1527.

Calvinistic Reformation in Switzerland, France, Holland, and Scotland. Outside Germany and Scandinavia the dominating figure in the Reformation was John Calvin (1509–64), who lived a generation later than Luther. Calvin's systematic theology, his *Institutes*, his influence as an educator, and his ability as an organizer, unrivaled among the other reformers, brought it about that the Reformed church, as Protestantism was called in Switzerland, France, and Scotland, received a thoroughly Calvinistic stamp, both in its theology and in its organization. In each of these countries, however, some reform movement had begun before the influence of Calvin was felt.

Switzerland.—In Switzerland Ulrich Zwingli (1484–1531), a contemporary of Luther, was, like him, a peasant's son and a patriot, but he was somewhat better educated, more of a humanist, and of a wider and more statesmanlike outlook. His discontent with the Roman church came, not through the overwhelming conviction of personal sin and the need of salvation by faith, but from his study of the classics and of the Greek New Testament. He too, like Luther, had seen the corrupt conditions in Italy, where he had accompanied the Swiss mercenaries as army chaplain. Though at first he took a papal pension to recruit Swiss troops for the papal cause, he later denounced the whole mercenary system as prejudicial to the morals, patriotism, and peace of the Swiss nation. After completing his studies at Vienna and Basel he became a parish priest and settled near the famous monastery of Einsiedeln, a centre of pilgrimages. In 1519 he was called to an influential position as preacher in the cathedral at Zurich, and there his great work as a reformer began. At the approach of an indulgence preacher, named Samson, Zwingli denounced indulgences so vigorously that the Pope deemed it wise to recall Samson. Zwingli soon rose to a leading position in Zurich by his sermons in the cathedral, by his talks with persons in the market place, and especially by his public disputations before the town council. In these he took his stand upon the Bible as the source of authority and wished to do away with everything in the Catholic system except what Scripture enjoined. In 1523 and the two following years, under his leadership, the shrines were opened and the relics burned; religious processions and the images of saints were abolished; priests and monks were relieved from the vow of celibacy; and a simple communion service was introduced in place of the Mass. These changes by which Zurich withdrew from the Catholic church were accomplished legally and quietly by votes of the Zurich town council. Some other towns, such as Basel and Bern, followed Zurich's example. But the original forest cantons were more conservative and adhered to Catholicism. In Switzerland, as in Germany, the authority of the central government was too weak to enforce uniformity and prevent civil war. Two short civil conflicts took place between the Protestant and Catholic cantons, and Zwingli fell on the field of battle at Cappel in 1531. Soon after this Calvin's doctrines and organization took root in Bern and the other Protestant cantons. Switzerland ever since has been part Reformed and part Catholic.

In France the way of the Reformation had been prepared by a group of pious men, half mystic and half humanistic, who had gathered at Meaux, near Paris. Their leader, Lefèvre d'Etaples (c.1455–1536), published in 1512 a scholarly Latin edition, with commentary, of St. Paul's Epistles. Like Luther, his study of St. Paul had brought him to a belief in justification by faith and to a denial of the doctrine of transubstantiation. In 1523 he translated the whole New Testament into French. His work was at first favored by the Bishop of Meaux and especially by the King's sister, Margaret of Angoulême. But as Luther's doctrines began to spread in France greater attention was paid to the similar doctrines of Lefèvre. He and his followers were denounced by the Catholic faculty of the University of Paris and were soon persecuted by the King, Francis I, who hated dangerous innovations and felt personally insulted because some one had had the effrontery to post a Protestant placard on the door of the royal bedroom. Many leading Protestants fled from France to escape persecu-

tion and settled in Geneva or Switzerland until strengthened by the Calvinistic reformation at Geneva.

John Calvin (q.v.) was born at Noyon in Picardy in 1509. He received an excellent training in theology with his uncle, who was a bishop, a systematic training in Roman law at the University of Orleans, and a wide knowledge of the classics from his own natural inclination towards humanism and the New Learning. It was this threefold training as theologian, jurist, and scholar, combined with an inborn intellectual ability of extraordinary power, which gave his writing and teaching their unique force. Having written for the rector of the University of Paris a famous inaugural address, which the rector delivered but which was regarded as tainted with Lutheran heresy, both Calvin and the rector had to flee from Paris to escape the persecution of the French King. Calvin retired to Basel and published there, at the age of 27, the *Institutes of the Christian Religion*. It contains the fundamental ideas which he put into practice at Geneva and which are the basis of the Calvinistic Reformation in other countries. Geneva was a French-speaking town dependent on Savoy until shortly before Calvin's arrival in 1536, when it became independent, with the government in the hands of a town council. Some reform measures had already been accomplished under Farel and Froment. Calvin insisted on more. The Lord's Supper must be celebrated at least once every month. Congregational singing of the Psalms must be part of the church worship. Children must be taught a catechism and confession of faith. Especially a strict discipline and supervision of morals must be exercised by the pastors and members of the church, and notorious sinners must be excommunicated and forbidden to approach the Holy Communion. This strict régime, which insisted on the observance of the Ten Commandments, aroused the opposition of the pleasure-loving Genevese. Farel and Calvin were forbidden to preach further (April, 1538), and were finally exiled from the city. But three years later, Calvin's friends again having gotten control of the government, he was recalled in triumph and spent the rest of his life (1541–64) in making Geneva what John Knox called the "most perfect school of Christ since the Apostles."

Calvin's theology rests on the underlying belief in the absolute sovereignty of God as the personal ruler of the universe and in the Bible as the sole and sufficient source of authority. But he interpreted the Bible "with reason and equity" in a more liberal and scholarly spirit than did Luther. Calvin believed in "double predestination"—that the "elect" formed an "invisible church" predestined by God for salvation while the rest of mankind, tainted with original sin through Adam's fall, was predestined with equal certainty to damnation. He did not, however, give this doctrine the prominence which has been given to it by later generations. Calvin's organization of his church was democratic and furthered the idea of representative government. Church officials—pastors, teachers, presbyters, and deacons—were elected, like civil officials, by members of the church. Church and state were separate in organization, but coöperated closely to support each other. Calvin drew up a definite creed, which was made compulsory on all citizens who wished to exercise political rights, and a catechism which was taught to children. All citizens were to have at least a common-school education so that they could read and understand the Bible for themselves. In 1559 Calvin founded a university at Geneva, soon famous as a place for training proficient pastors and teachers. To enforce discipline of morals Calvin made efficient a rigid inspection of household conduct, and organized a consistory, composed of pastors and laymen, with wide powers of compulsion. Dancing, card playing, dice, and other recreations were forbidden; blasphemy and ribaldry were severely punished; even the dress and demeanor of citizens were prescribed down to minute details. In this severe Genevan atmosphere were formed the men of strong moral fibre and unflinching temper who went forth into Switzerland, France, Holland, Scotland, and even Germany, taking with them the Calvinistic system and spirit.

France.—To France before 1567 there had come from Geneva 120 pastors trained by Calvin. In 1559 delegates from 66 Protestant churches in France met at Paris in a national synod. This synod drew up a confession of faith and a book of discipline based on those at Geneva. Thus was organized the first national Protestant church in France. Its members were hereafter commonly known as Huguenots, probably a corruption of Eidgenossen, the name of the Confederates of Switzerland and Geneva from whom the French drew so much of their religious thought and organization. Unfortunately the Huguenot cause in France became involved in the rivalries of political factions. Nobles often joined or deserted the Huguenot ranks from political interest rather than from religious conviction. These political factions, combined with religious hatreds, led to a generation of civil wars (1562–98), broken by a few truces and darkened by the treacherous and terrible Massacre of St. Bartholomew (q.v.) in 1572, in which many thousands of Protestants, including their heroic leader, Gaspard de Coligny, perished. Under Henry IV (1589–1610), King of Navarre and France, the Huguenots triumphed for a moment at the battle of Ivry. But Paris and more than nine-tenths of the population of France remained Roman Catholic. In these circumstances Henry IV deemed it expedient to announce his conversion to Catholicism, while at the same time protecting his former Huguenot friends by issuing in 1598 the Edict of Nantes (q.v.).

Holland.—In Holland Calvinism spread gradually in the middle of the sixteenth century until it attained such a firm hold among the liberty-loving Dutch that they rose in 1568 in political and religious revolt against the cruelties and oppression of the Catholic governors sent by Philip II of Spain. The leadership of the revolt was taken by William the Silent, of the noble house of Orange-Nassau. Though often defeated and forced to retreat, he retained the love and confidence of the Dutch until they formed themselves into a republic by the Union of Utrecht (1579) and declared themselves independent of Spain (1581). William the Silent was assassinated soon afterward by a Catholic zealot (1584). But the Eighty Years' War of Liberation was continued under the leadership of his descendants until in 1648, in the Peace of Westphalia, Spain finally gave up the claim

to an authority which she could no longer exercise.

Scotland.—In Scotland the way for the Calvinistic Reformation was prepared by the remnants of Lollardy among the people. The beginnings of a reform movement under Lutheran influence were made by Patrick Hamilton, who was martyred for his faith in 1528, and by George Buchanan, who was imprisoned but managed to escape. The decisive movement was led by the fiery John Knox (1515–72). Captured by the French and forced to sit for 19 months chained as a galley slave, he afterward returned to England and preached for five years (1549–54). The accession of the Catholic Mary Tudor drove him from England to Geneva, where he became an ardent disciple of Calvin. In 1559 he returned to Scotland to lead the Calvinistic Reformation. In 1560 he persuaded the Scottish Parliament to adopt a confession of faith and book of discipline adapted from those at Geneva to meet the special conditions in Scotland. It provided for the government of the Scottish Presbyterian church by local kirk sessions and by a general assembly composed of ministers and presbyters representing the local churches of all Scotland. Mary, Queen of Scots, attempted to overthrow the new Protestant church, but after a seven years' struggle she herself was forced to flee across the border to England. Calvinism was left triumphant in Scotland, except for a few districts in the north, where noble families adhered to the old faith.

Calvinistic or Reformed doctrines also spread into western Germany and were taken up by some of the German princes, notably by the Hohenzollern family in Brandenburg in 1613. But Calvinism met with bitter opposition in Germany for more than a century from both Catholics and Lutherans.

Reformation in England. The English revolt from Rome differed from the revolts in Germany, Switzerland, and France in two respects. First, England was a compact nation with a strong central government, and therefore, instead of splitting into parties and ending in civil war, the revolt was national, the King and Parliament acting together in transferring to the King the ecclesiastical jurisdiction hitherto exercised by the Pope. Second, in the continental countries a religious agitation by the people had preceded and caused the political break from Rome; but in England the political break came first, over the question of Henry VIII's divorce, while the change in religious doctrines and modes of worship came long afterward in the reigns of Edward VI and Elizabeth. When Lutheran doctrines began to make headway in England, where the ground was well prepared by Wiclif's earlier teachings, Henry VIII had hastened to write a pamphlet attacking the Wittenberg heresies. For this he received from the Pope the title Defender of the Faith, ever since borne by English monarchs. Eight years later, however, he wished to divorce his Catholic wife, Catharine of Aragon. As she had been previously married to his brother Arthur, she ought not, by ecclesiastical law, to have contracted a similar relation with Henry; but a special dispensation had been granted by the Pope setting aside the ecclesiastical law. The question now was whether this dispensation was valid. Henry claimed that it was not and that he and Catharine ought to separate. The Pope upheld the validity of the dispensation and, for political as well as religious reasons, refused to annul the marriage or sanction a divorce. Henry then turned to the reformers and foreign universities for an opinion. From Zwingli and Œcolampadius he received the advice that his marriage was null; from Luther and Melanchthon, that it was binding, but that polygamy was lawful in certain circumstances. Henry followed the advice of both: he married Anne Boleyn on Jan. 25, 1533, and on March 30 of the same year had Thomas Cranmer, Archbishop of Canterbury, sitting in an ecclesiastical court, pronounce his divorce from Catharine. When he was excommunicated by the Pope, Henry replied in 1534 with the Act of Supremacy passed by a submissive Parliament. This Act appointed the King and his successors "supreme head of the Church of England," i.e., of a national Anglican church. Other acts of Parliament cut off all the Pope's revenues and put a complete end to his political and religious authority in England. The monasteries were suppressed (1536–39) and their property greatly added to Henry's resources. Beyond these changes Henry did not want to go. To prevent the spread of Lutheran doctrines and practices, Henry secured from Parliament in 1539 the severe Act of Six Articles, which declared it heretical, with heavy penalties, to deny transubstantiation, communion in one kind, sacerdotal celibacy, inviolability of the vow of chastity, and the necessity of private masses and auricular confession. Several Lutherans were burned, while those who upheld the supremacy of the Pope were executed as traitors. Under Edward VI (1547–53) the Protestant religious doctrines and practices which Henry VIII abhorred were introduced into the Anglican church. The Act of Six Articles was repealed at once (1547), and several continental reformers, including Martin Bucer, were invited to England. The first Prayer Book of Edward VI, adopted in 1549, provided a uniformity of service which was enforced by law on all. This was followed by a second Prayer Book in 1552 and by a new creed in forty-two articles. Mary Tudor (1553–58) endeavored to restore the Roman Catholic religion and burned many Protestants at the stake. Other Protestants, like Knox, fled to the Continent, where they were strengthened and often made more radical by contact with Calvinism. The final settlement came under Queen Elizabeth (1558–1603) in the year 1563. The Forty-two Articles of Edward VI were reduced to the Thirty-nine Articles which still form the Anglican creed. This creed is Protestant and closer to Lutheranism than to Calvinism; but the episcopal organization and the ritual of the Anglican church were largely retained from the Roman Catholic church. A large number of people under Elizabeth did not feel that this Established church was sufficiently reformed and purified of Romanism; they formed numerous Calvinist sects —Presbyterians, Puritans, Brownists, Separatists—known collectively as dissenters or nonconformists.

Minor Sects. Besides the three great churches, Lutheran, Reformed, and Anglican, there were born of the Reformation a large number of small sects, a natural consequence of the Protestant repudiation of traditional authority and exaltation of private judgment. In the first years of the revolt there arose at

Zwickau in Saxony a small body known as Anabaptists, because of their belief that infant baptism was invalid and their insistence that adherents to their church should be rebaptized. Though frowned upon by Luther, their propaganda spread with extraordinary rapidity throughout Germany. The diversity of their opinions was marked. Some were Quietists, like the later Quakers. Others believed in the renovation of church and state by armed revolt and contributed to the Peasant Revolt of 1524–25. In 1529 the Diet of Spires condemned the Anabaptists to death, and this was promptly acted upon by Lutherans and Zwinglians as well as by Catholics. In 1534 under the tailor, John of Leyden, they obtained the upper hand in Münster, and scandalized Europe by their polygamy and communism, until they were suppressed by a combined force of Lutherans and Catholics. In 1538 England passed a law condemning them to death. For a century they suffered martyrdom, but they survived nevertheless and are the predecessors of the present Baptist church.

Unitarianism was also sporadic in the sixteenth century. The Spaniard, Michael Servetus, for his *De Trinitatis Erroribus* (1531), was burned at Geneva in 1553. The Italians Lelio and Fausto Sozzini expressed their doubts about the Trinity to a group of friends in 1546. They were compelled to seek safety north of the Alps, and formed a considerable number of antitrinitarian followers in Switzerland, Germany, Holland, and Poland.

General Results of the Reformation. The Protestant Revolution was only partially successful. Where it succeeded it strengthened the national life of the Protestant nations and tended towards the blending of all social classes into one community. Where it failed it produced, as every unsuccessful revolution does, reaction. In the Catholic nations, like Spain and France, the civil and ecclesiastical authorities were more closely allied than before. The Inquisition and the Index were symbols of one kind of despotism, as the French Bastille was of the other. Where it partially succeeded and partially failed, as in Germany and Switzerland, it resulted in civil wars and in the long postponement of the growth of a healthy, vigorous national life. The Reformation greatly advanced the growth of national languages and literature. Luther's Bible and Calvin's New Testament and *Institutes* became classical models for the language of religious and philosophical thought. The fact that the religious controversies of the time were carried on largely in the language of the people instead of in Latin, and that there was such an increase in the popular reading of the Bible and the singing of hymns in the vernacular, greatly stimulated the development of the new national tongues. Popular education received a similar stimulus through the New Learning and the new schools of Colet in England, of Calvin in Geneva, and of the Protestant princes in Germany. Religion became less a thing of the clergy and more a thing of the people. Religious toleration, however, made but little progress for a century. All the sects persecuted those who differed materially from themselves. The Reformation was accompanied by an increase of the witchcraft delusion, so that more unhappy wretches were burned on this charge in the sixteenth century than in any preceding one.

Bibliography. Sources: The best sources are the writings of the reformers themselves, lists of which will be found in articles under their names. The writings of most of the English Protestant leaders have been published by the Parker Society (55 vols., Cambridge, 1845 et seq.), and of the more important French reformers by A. L. Herminjard, *Correspondance des réformateurs dans les pays de la langue française* (9 vols., Geneva, 1866–97); H. Hauser, *Les sources de l'histoire de France*, part ii, vols. ii, iii (Paris, 1909–12); Dahlmann-Waitz, *Quellenkunde der deutschen Geschichte* (8th ed., Leipzig, 1912); also, *Bulletin de la Société de l'Histoire du Protestantisme Français* (Paris, 1873 et seq.), *Archiv für Reformationsgeschichte*, edited by W. Friedensburg (Berlin, 1903 et seq.), and general historical reviews. Early histories of the Reformation still of value: Johannes Sleidanus, *De Statu Religionis et Reipublicæ Carolo V Cæsare* (Strassburg, 1555; Eng. trans., London, 1560); John Foxe, *Acts and Monuments of the Church* (ib., 1563).

General history: Friedrich von Bezold, *Geschichte der deutschen Reformation* (Berlin, 1886); Guiraud, *L'Eglise et les origines de la Renaissance* (Paris, 1902); J. Haller, *Papsttum und Kirchenreform* (Berlin, 1903); *Cambridge Modern History*, vol. ii (New York, 1904), containing exhaustive bibliographies; A. M. Whitehead, *Gaspard de Coligny* (ib., 1904); Leopold von Ranke, *History of the Reformation in Germany*, English translation by S. Austin (ib., 1905); Baudrillart, *L'Eglise catholique, la Renaissance, le protestantisme* (Paris, 1905); Johannes Janssen, *History of the German People at the Close of the Middle Ages*, English translation by A. M. Christie (16 vols., St. Louis, 1905–10), from the Roman Catholic standpoint, rich in illustrative material from contemporary sources; P. Imbart de La Tour, *Les origines de la réforme* (3 vols., Paris, 1905–14); T. M. Lindsay, *A History of the Reformation* (2 vols., New York, 1906), one of the best general accounts in English; G. P. Fisher, *History of the Reformation* (ib., 1906); Ludwig Pastor, *History of the Popes from the Close of the Middle Ages*, English translation by Antrobus and Kerr (3d ed., vols. i–xii, London, 1906–12), scholarly Roman Catholic point of view; Herbert Bruce, *The Age of Schism, 1304–1503* (New York, 1907); W. Moeller, *Reformation und Gegenreformation* (3d ed., Tübingen, 1907; Eng. trans. of 2d ed. by J. H. Freese, New York, 1900); H. M. Baird, *History of the Rise of the Huguenots of France* (new ed., 2 vols., ib., 1907); Thudicum, *Die Reformation* (Leipzig, 1907–09); Philip Schaff, *History of the Christian Church*, vols. v–vii (new ed., New York, 1907–10); J. W. Thompson, *The Wars of Religion in France, 1559–1576* (Chicago, 1909); Albert Werminghoff, *Nationalkirchliche Bestrebungen in deutschen Mittelalter* (Stuttgart, 1910); B. J. REFORM'ATORIES. Penal institutions for young offenders where the object of punishment is subordinated to that of moral regeneration. It is difficult to fix definitely the time when it was recognized that juvenile offenders should not be merely punished for crime, but that efforts should be made to reform them.

The philanthropic efforts of John Howard and Elizabeth Fry in the eighteenth century prepared the way for new views in penology. At the same time interest in the care of neglected children and of juvenile delinquents, which had from the days of Queen Elizabeth found expression in the English Poor Law, was leading to many new experiments. The most valuable of these, however, was first tried in Germany, where in 1833 the Rauhes Haus (q.v.) in Hamburg introduced the plan of having the children cared for in families on the cottage plan. This principle was adopted at Mettray, France, in 1839 and has since become the favored method for juvenile reformatories, though the congregate plan still exists and has its adherents. Captain Brenton, of England, about 1830 urged that no child under 16 should be sent to prison, but should be trained in some special institution. In accord with his ideas an industrial school for girls was started at Chiswick. In 1847 the institution at St. George's restricted its care to boys charged with or convicted of crime. From this time the movement made progress in England. In 1854 the Reformatory Schools Act was passed, which took legal cognizance of the principles of the reformatories. France in 1850 had already enacted similar legislation. Distinction must be made between the purely industrial schools which receive children who are destitute and the reformatory schools which receive those guilty of criminal acts. Sometimes, particularly in the earlier institutions, the two classes were mixed. See POOR LAWS.

The reformatory system has had its widest development in the United States. In 1824 the House of Refuge on Randall's Island, New York, was established by law. It was and still is conducted on the congregate plan. Other cities followed the example. Such houses of refuge were under private control, but the public shared in the expense. These early institutions were followed by State reform schools. The change in names is interesting. All indications that the boys were committed to the institution for breaches of the law were avoided, as, e.g., in the title of the Lyman School for Boys (1848). Besides these institutions for delinquents there have sprung up many industrial schools for orphans and neglected children. Usually the two are separated, and the sexes also are usually in separate schools. In the earlier institutions the employment of the children was too often decided from a financial standpoint solely. It is now recognized that it should be not productive, but instructive.

It remained for the United States further to develop the reformatory system and make it applicable to young men and women. The principles introduced at Norfolk Island by Machonochie, and in Ireland by Crofton, had found favor in the country. It was proposed to combine these with the principles of the reformatories and seek not merely to punish, but to bring to self-support and self-respect, the younger criminals for whom there might yet be hope. The beginning of this movement dates from the National Prison Congress of 1870, at which Z. R. Brockway outlined a plan for a new class of institutions. In 1866 New York had enacted legislation establishing a reformatory. The plans were altered in 1869, but it was not opened until 1876, when Mr. Brockway was appointed superintendent of the Elmira Reformatory (q.v.). In 1877 the principle of the indeterminate sentence was legally adopted. The growth of the institution and its constant success won world-wide attention. In 1877 Massachusetts founded a reformatory for women at Sherborn and in 1884 one for men at Concord. Many other States have followed the example of these two.

The fundamental idea of these reformatories is that instead of repressive and punitive measures there should be constant training along lines of industry, physical and mental development, to enable the prisoner to stand alone after his release. To make more effective this training, his self-interest is appealed to by the indeterminate sentence. This makes the length of his stay in the institution largely dependent upon his behavior and progress while there. He is thus stimulated to take advantage of his opportunity. His release is conditional, and if he violates the terms of his parole he may be returned to the institution. The claim is made that fully 80 per cent of young felons released from American reformatories have subsequently led upright lives. Unfortunately the claim can be neither supported nor disproved, because there has nowhere been any systematic trace and record kept after the full term of the original sentence has expired.

The age limits within which first offenders are sentenced to reformatories vary. The lower limit is usually 15 or 16 years. The upper limit seldom exceeds 30. In form of construction reformatories are like prisons with separate cells. The inmates are divided into grades, usually three. The Sherborn Reformatory for Women in Massachusetts has four. There are different privileges for the different grades, and

release on parole is open only to those in the highest.

REFORM BILLS. In English history, the name of several measures introduced into Parliament, chiefly during the nineteenth century. These bills, three of which were passed—viz., in 1832, 1867, and 1884–85—abolished the abuses which had grown up in regard to the representation in the House of Commons and greatly extended the suffrage. For details regarding the struggle, which preceded the passing of the great Reform Bill of 1832, see GREY, CHARLES, second EARL GREY; for the provisions of the various acts, see PARLIAMENT. See also sections on *History* and *Government* under GREAT BRITAIN.

REFORMED CATHOLIC CHURCH. A movement begun in New York City between 1880 and 1885 among priests who had renounced the jurisdiction and doctrine of the Roman Catholic church and engaged in evangelistic labors among the people. It had, in 1915, 7 ministers, 6 church organizations, and about 3250 members, chiefly in New York, Massachusetts, Pennsylvania, and Illinois.

REFORMED CHURCHES. A term employed in a conventional sense to designate those Protestant churches which follow the doctrines and polity of Zwingli and of Calvin (qq.v.) rather than the Lutheran. (See LUTHERANISM.) The influence of Calvin proved more powerful than that of Zwingli, and on the continent of Europe the Reformed churches are generally known as Calvinistic churches, the name Protestant church in some countries being almost equivalent to Lutheran. One chief distinction of the Reformed churches is their doctrine of the Lord's Supper (q.v.). They also reject certain ceremonies which the Lutherans have seen fit to retain. The Church of Scotland, the Protestant church of France, that of the Netherlands, some German churches, and the Protestant churches of Hungary, Bohemia, and Poland belong to the Reformed churches, while the English dissenting churches are closely connected with them. Most of the Protestant churches in the United States belong to the Reformed rather than to the Lutheran group. See PRESBYTERIANISM; REFORMATION.

REFORMED CHURCHES HOLDING THE PRESBYTERIAN SYSTEM, ALLIANCE OF. See ALLIANCE OF THE REFORMED CHURCHES HOLDING THE PRESBYTERIAN SYSTEM.

REFORMED CHURCH IN AMERICA, THE. A body of Christians in the United States composed originally of settlers from Holland, but now largely intermixed with elements from many other sources. Until 1867 it was known as the Reformed Protestant Dutch Church in North America. The history of the church begins with that of the Reformation in the Netherlands, where the movement met with a hearty welcome.

Entering from Germany, it afterward received its chief impetus from Switzerland and France. Hence its distinctive type of the Reformed doctrine and the more democratic Presbyterian polity. But in Holland, as elsewhere, there had been a great preparation made by Reformers before the Reformation. The monks John Esch and Henry Voes for their evangelical preaching were burned at Brussels (1523) and were perhaps the first martyrs of the Reformation. The Reformed Church of the Netherlands began her more formal existence in 1566, when the so-called League of Beggars was formed. Field preaching and the singing of evangelical hymns rapidly spread the Reformed doctrine. Conventions or synods of the Dutch Reformers during the next two decades formulated a liturgy and rules of church government and adopted standards of doctrine—the Belgic Confession and the Heidelberg Catechism (qq.v.). Because of Spanish persecution these synods were held outside of Dutch territory. In 1643 copies of these rules of church government were sent to the Westminster Assembly as a specimen of Presbyterian polity. In 1618–19 the famous Synod of Dort (q.v.), called to consider the controversy which had sprung up between the Calvinists and Arminians, formulated the Canons of the Synod of Dort.

The earliest Dutch church organization in America was made in New York in 1628 by Rev. Jonas Michaelius. This is now the strong and wealthy Collegiate Church, with its half-score of buildings and 14 ministers. During the government of the West India Company down to 1664, 13 Dutch churches were established in America and 16 ministers in all had officiated. Then came the English conquest. Dutch immigration ceased. It was a question whether the Dutch church could survive under the English government. During the next half century there was an almost constant struggle with the English governors, who naturally sought to establish the Church of England. During this same period there was also a considerable accession of Huguenots to the country, who largely fell into the fold of the Dutch church. At first, however, during the reigns of Charles II (1660–85) and James II (1685–88), full liberty was ostensibly granted to all denominations. But with the accession of William III (1688) the normal policy of the English government was restored, and more persistent attempts were made to impose the Church of England on a population which was overwhelmingly Dutch. A Ministry Act was secured in 1693, but it had been so emasculated in its passage that it was found to be entirely unsectarian; yet it was often arbitrarily perverted by certain of the governors in favor of the Church of England. Because of such perversion the Dutch church of New York City managed in 1696 to extort a charter from Governor Fletcher, and this course was successfully followed by other Dutch churches, so that the Dutch church really remained ecclesiastically independent.

A church organization styled the cœtus was formed in 1747, but, owing to ecclesiastical interference from Holland, it found itself unable to ordain. Hence it declared itself an independent American classis with full powers in 1754. Meantime an effort was made to estab-

lish a Dutch divinity professorship in King's College, New York City, which was accomplished in 1775, but this split the church more completely and led to the securing of a charter for Queen's College (New Brunswick, New Jersey) in 1766 and an amended charter in 1770. The two parties came together in 1771 upon articles of union, securing semi-independence from the Church of Holland, but the Revolution delayed the speedy development of the new plans. In 1784 a professor of theology was elected, Rev. Dr. John H. Livingston, and this was the beginning of a theological seminary, the first in the country.

In 1792 an Americanized constitution of church government was adopted, which has gone through two revisions since, viz., in 1832 and 1874. The church continued to grow slowly. In 1800 there were about 100 churches and 40 ministers in service. The number of ministers did not equal the number of churches until 1845, when there were 375 of each. In 1846 began a new Dutch immigration which settled in the Middle West, but is now penetrating even to the Pacific coast. Many of these newcomers fell into the old Dutch church, and there are now more than 200 churches from this source and as many ministers.

In doctrine the Reformed Church in America has ever adhered to the standards already referred to, adopted in Holland. She also indorsed the Westminster Catechism in 1837. Her form of government is of the so-called Presbyterian type, first proposed by Calvin, and was adopted in 1568. This enumerated four classes of officers in the church, viz., ministers, teachers (or professors), elders, and deacons. Four grades of ecclesiastical bodies were also defined, viz, consistories, classes, provincial synods, and a General Synod. The Reformed church has a liturgy, but this is obligatory only in the administration of the sacraments and ordinations. It has received some additions from time to time as necessity required. The General Synod of 1906 announced the adoption of a revised liturgy, the forms for the administration of the sacraments not to take the place of the old, but to be used as alternates. In all other respects her mode of worship is free. The General Synod is incorporated and holds all funds and endowments of the theological seminaries and, in part, of the colleges and other agencies. The General Synod operates through a board of direction. The colleges are also incorporated as well as the various boards, such as the board of education, the board of foreign missions, the board of domestic missions. The churches exist in New York, New Jersey, Pennsylvania, Maryland, Ohio, Michigan, Wisconsin, Indiana, Illinois, the Dakotas, Minnesota, Kansas, Nebraska, Montana, South Carolina, Wyoming, Maine, Washington, and Manitoba.

In 1915 the Reformed Church in America reported 718 churches, 750 ministers, 71,000 families, and 127,000 communicants. There are also about 129,000 enrolled in the Sabbath schools. Nearly $552,000 was raised during the year for benevolent objects and $1,700,000 for congregational purposes. The church has several flourishing institutions: Rutgers College (1766) and a theological seminary (1784) at New Brunswick, N. J.; Hope College (1866) and the Western Theological Seminary (1866) at Holland, Mich.; and incipient institutions in other States. The church has been especially successful on the foreign field, having missions in India, China, Japan, and Arabia. The foreign missionaries numbered, in 1906, 100, of whom 22 were in China, 31 in India, 28 in Japan, and 19 in Arabia. The missions in China and Japan are working in hearty union with missions of other denominations.

REFORMED CHURCH IN THE UNITED STATES, THE (GERMAN REFORMED). The founders of this denomination came to America from the Rhine provinces of Germany and from the German cantons of Switzerland. Among them were also influential French and Dutch families of the Reformed faith. They arrived in considerable numbers from 1710 to 1770, and Reformed congregations were established by the Palatines or the Swiss in the Colonies of New York, Pennsylvania, Maryland, Virginia, Carolina, and Georgia. The first congregation was located at Germantown, Va., in 1714. The pastor was the Rev. John Henry Haeger. The Reformed congregations in the Colonies, barring those in Pennsylvania, were gradually absorbed by neighboring Presbyterian, Episcopalian, or Lutheran churches, but the church became a denominational organization in the German and Swiss settlements of Pennsylvania. The first Reformed minister in this province was the Rev. Samuel Guldin (1664–1745). The organizer and first pastor of the three original congregations was John Philip Boehn (1725), located in the region of Montgomery and Bucks counties, but before 1740 at least 24 Reformed congregations are known to have existed in Pennsylvania. The leading ministers of this period were Boehn, Templeman, Weiss, Rieger, and Goetschius.

In 1747 the congregations were united in a cœtus (synod) under the leadership of the Rev. Michael Schlatter (1716–90), who was sent to America by the synods of North and South Holland. During the cœtal period the church was under the jurisdiction of the Holland synods. Both ministers and funds for the sup-

port of ministers were received from Holland, Germany, and Switzerland.

The cœtus in 1793 became independent of Holland oversight, turning into a synod. It adopted a constitution of its own and assumed the name "The Synod of the Reformed (High) German Church in the United States of America." At this time there were about 15,000 communicants. The great majority of the congregations were located in Pennsylvania, but congregations were also found in New York, New Jersey, Maryland, Virginia, North Carolina, and Ohio.

In the early period of the synod the institutions and equipment which are indispensable to the growth of a denomination were wanting. It was the time of congregational individualism, and even congregations were divided by bitter controversies on the question of language in worship. A missionary and an educational spirit awoke in the second and third decades of the nineteenth century. The first missionary committee was appointed by the synod in 1819, and the first missionary society was organized in 1826. In 1824 the Synod of Ohio was organized. The first theological seminary was opened in 1825 at Carlisle, Pa. (now at Lancaster, Pa.), and Marshall College (now Franklin and Marshall College at Lancaster, Pa.) was chartered in 1826 at Mercersburg. The *Magazine of the German Reformed Church*, now known as the *Reformed Church Messenger*, was published in 1827. The first volume of the *Mercersburg Review*, a theological quarterly, now known as the *Reformed Church Review*, appeared in 1849.

The General Synod, including originally 2 district synods and 21 classes, was organized in 1863. In 1915 it was composed of 9 district synods and 61 classes. Since the organization of this judicatory the church has made remarkable progress in all lines of work, both at home and abroad. The relative numerical strength of the Reformed Church in the United States is shown by the fact that it ranks second on the roll of Reformed and Presbyterian churches in the United States and Canada. In 1915 the statistics were as follows: synods, 915 English and 4 German (three-fourths of the communicant members are in the English synods; many congregations in the German synods have English preaching); ministers, 1217; congregations, 1770; communicant members, 312,660; unconfirmed, 134,751; benevolent contributions, $594,000; congregational purposes, $2,161,000; home missionary congregations, 238; 31 missionaries in Japan; 30 missionaries in China; orphans' homes, 7; theological seminaries, 3; colleges for men, 5; colleges for women, 2. Flourishing schools are connected with the Japanese and Chinese missions.

The Heidelberg Catechism (q.v.) serves both as a confession of faith and as a book of instruction. The policy of the church is presbyterial. In its mode of worship it is bound neither to a ritual nor to a free service. It has liturgical forms for morning and evening worship and for the special services of the Lord's Supper, baptism, etc., but it allows the congregation the use of a free service. The festivals and seasons of the Church year are generally observed. Baptized children are prepared for communicant membership under special oversight of the pastor through catechetical instruction and received by the rite of confirmation.

From 1840 to 1878 the church passed through a theological and a liturgical controversy. It was caused by the introduction, by Dr. Philip Schaff and Dr. John W. Nevin, of German philosophy and theology of the mediatorial type into the Theological Seminary at Mercersburg, Pa. The distinctive system of thought came to be known as the "Mercersburg theology." The church was divided into two parties, without a schism, known as the high church or liturgical party and the low church or antiliturgical party. The controversy closed with the introduction of the peace movement in the General Synod of 1878. See MERCERSBURG THEOLOGY.

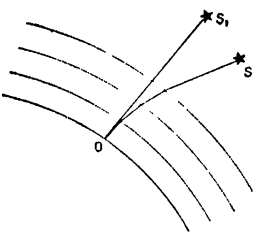
REFORMED EPISCOPAL CHURCH, THE. A church which was organized by such members of the Protestant Episcopal church as were opposed to the growth of sacramentarianism and sacerdotalism in that communion, and for any others who, like-minded with them, desire to be associated with a church evangelical in its teachings, liturgical in its worship, and episcopal in its government. It was organized in New York City, Dec. 2, 1873, with 8 clergymen, including 1 bishop, and 20 laymen, all of whom had been or were at the time ministers and laymen in the Protestant Episcopal church identified with the evangelical or Low Church party. One of them, George David Cummins, had been Assistant Bishop of the diocese of Kentucky until Nov. 10, 1873, when by letter to the presiding Bishop he resigned his office and withdrew from the denomination. He became the first and presiding Bishop of the new church; the Rev. Charles Edward Cheney, of Chicago, was also elected Bishop and consecrated on a subsequent day. The following statement, condensed from the declaration of principles adopted at the organization, explains in the briefest form possible the doctrines held: I. The Reformed Episcopal church declares its belief in the Holy Scriptures of the Old and New Testaments as the word of God and the sole rule of faith and practice; in the Apostles' Creed; in the divine institution of the sacraments of baptism and the Lord's Supper; and in the doctrines of grace substantially as they are set forth in the 39 articles of religion. II. It recognizes and adheres to episcopacy, not as of divine right, but as a very ancient and desirable form of Church polity. III. Retaining a liturgy, not imperative or repressive of freedom in prayer, it accepts the Book of Common Prayer as it was revised, proposed, and recommended for use by the General Convention of the Protestant Episcopal church (1785); reserving the right to make alterations in it, provided that the substance of faith be kept entire. IV. It condemns and rejects the following doctrines as contrary to the word of God: (1) That the Church of Christ exists only in one form of ecclesiastical polity. (2) That Christian minis-

ters are "priests" in another sense than that in which all believers "are a royal priesthood." (3) That the Lord's table is an altar on which an oblation of the body and blood of Christ is offered anew to the Father. (4) That the presence of Christ in the Lord's Supper is a presence in the elements of bread and wine. (5) That regeneration is inseparably connected with baptism.



At the twentieth General Council, Philadelphia, 1906, there were reported as belonging to the church in the United States and Canada, 9 bishops, 83 ministers, 80 parishes, about 11,000 communicants, 850 Sunday-school teachers, and a total of about 10,000 teachers and scholars; annual offerings about $475,000; value of church and parish buildings and rectories, $1,371,977. The church has a small membership in England. The denomination is strongest in Philadelphia and Chicago. It has a well-equipped and endowed theological seminary in Philadelphia, maintains two denominational papers, and supports a woman's foreign missionary society, with stations in India. It has a denominational endowment fund of about $350,000. Consult A. D. Price, *History of the Formation and Growth of the Reformed Episcopal Church* (Philadelphia, 1902).

REFORMED MENNONITES, The. See MENNONITES.

REFORMED PRESBYTERIANS. See CAMERONIANS; PRESBYTERIANISM.

REFRAC'TION (ML. *refractio*, breaking up, refraction, from Lat. *refringere*, to break up, from *re-*, back again, anew + *frangere*, to break). A phenomenon, like reflection, common to all kinds of wave motion If there are two media separated by a bounding surface in which the trains of waves of the particular kind travel with different velocity, a train of waves in one medium will, on reaching the bounding surface, produce similar waves in the other medium; these are called refracted waves, because in general each ray of the incident waves has its direction changed or broken at the surface. (See LIGHT.) Snell's laws for refraction are that the angles α_1 and α_2 made by the incident and refracted rays with a perpendicular to the refracting surface at the point of incidence are connected by the relation $\frac{\sin \alpha_1}{\sin \alpha_2} = n$, a constant for the two media if the waves have a constant wave number, and that the two rays and the perpendicular to the surface are in one plane. It is easily seen that the index of refraction is the ratio of the velocities of the waves in the two media V_1 and V_2, viz., $\frac{\sin \alpha_1}{\sin \alpha_2} = \frac{V_1}{V_2}$. Therefore this ratio, which is called the index of refraction, is different for different media; and for any one case it varies with the wave number if there is dispersion (q.v.). Refraction is illustrated in aërial waves by the effect on them of heated columns of air, and in the case of ether waves by the action of prisms, etc. It is important to realize that, in the case of a train of waves passing from one medium into another, the wave number is not changed. If the velocities in the two media are V_1 and V_2 and, if N is the wave number, the wave lengths in the two media are respectively $\lambda_1 = \frac{V_1}{N}$, $\lambda_2 = \frac{V_2}{N}$. Certain crystals and strained isotropic bodies exhibit double refraction; i.e., if a ray of light falls upon them there are two refracted rays. See LIGHT.

REFRACTION, Astronomical. The effect of refraction in the appearance of the heavenly bodies is to make them appear higher in the sky. Thus refraction increases the altitude, but it does not alter the azimuth. In the figure S is the true position of the star and S_1 the apparent. The refraction is greatest at the horizon, where it is about 37′. This is evident since the angle of incidence is here the greatest. From the horizon to the zenith the refraction constantly decreases, very rapidly near the horizon and more slowly at greater elevations. It varies approximately as the tangent of the zenith distance down to a zenith distance of about 70°, and is entirely independent of the distance.

The effect of refraction upon the rising and setting of the heavenly bodies is to make them appear to rise earlier and set later than they would if there were no atmosphere. The horizontal refraction varies from 35′ to 39′. Therefore when we see the sun's lower limb rising the whole disk is really below the horizon. In this way the refraction accelerates the sunrise and at sunset delays it an equal amount Thus the total effect of refraction is to increase the length of the day at the expense of the night from four to eight minutes, according to the inclination of the sun's diurnal circle to the horizon.

Refraction also explains the elliptic appearance of the sun's and moon's disks when near the horizon. Owing to the rapid increase in the amount of refraction near the horizon, the lower limb appears more elevated than the upper, thus shortening the vertical diameter.

Another effect of refraction when the air is much disturbed is to make the stars "dance," especially when seen through a large telescope with high power. This is due to the constant displacement of the image by the varying refraction.

REFRIG'ERANTS (from Lat. *refrigerans*, pres. p. of *refrigerare*, to cool again, from *re-*, back again, anew + *frigerare*, to cool, from *frigus*, Gk. *ῥῖγος*, *rhigos*, cold). A name given to a class of medicines that reduce the temperature of fevers, allay thirst, and cause a feeling of coolness and refreshment throughout the system. They reduce and equalize blood pressure, quiet the overexcited heart, and excite perspiration and an increased urinary flow. By stimulating the excretory functions they help to eliminate the toxic products of inflammation. Most of these remedies belong to the class of the vegetable acids and their salts, but aconite and similar drugs, which act primarily on the circulation, may also be considered refrigerants. The vegetable acids used are tartaric, citric, and acetic. Citric acid may be conveniently given in the form of lemonade or orange juice; acetic acid in the form of vinegar. The diaphoretic refrigerants (those which excite perspiration) are aconite, veratrum viride, and potassium citrate. The latter is a favorite ingredient of so-called fever mixtures. The diuretic refrigerants (those which stimulate the urinary flow) are the bicarbonate, citrate, acetate, bitartrate (cream of tar-

tar), sulphate, chlorate, and nitrate of potassium. Potassium carbonate is active particularly in the form of the ethereal spirit popularly known as sweet spirit of nitre. Most of the refrigerants, however, are both diaphoretic and diuretic in their action.

REFRIGERATING MACHINES. See REFRIGERATION.

REFRIGERATION, rē-frĭj'ĕr-ā'shŭn (Lat. *refrigeratio,* from *refrigerare,* to cool again). The art of producing cold by artificial and particularly by mechanical means. It was practiced in very ancient times, but only in comparatively recent years has it been profitably done on a commercial scale. Mechanical refrigeration is now employed in the manufacture of artificial ice; for the freezing and chilling of freshly killed meat in slaughterhouses; for the cooling of stores for meat, fish, fowl, fruits, vegetables, and other perishable provisions; for cooling the atmosphere of auditoriums, dwellings, and hospitals; for storing furs and other valuable garments to protect them from moths; for certain engineering operations; and for a variety of manufacturing processes The number and variety of refrigerating devices available for these purposes are very great, but they all belong to one or the other of the following five classes: (1) devices in which the more or less rapid liquefaction of a solid is utilized to abstract heat; (2) devices by which the abstraction of heat is effected by the evaporation of a portion of the liquid to be cooled; (3) devices in which the abstraction of heat is effected by the evaporation of a separate refrigerating agent of a more or less volatile nature, which agent is subsequently returned to its original condition by mechanical compression and cooling; (4) devices by which the abstraction of heat is effected by the evaporation of a separate refrigerating agent of more or less volatile nature under the direct action of heat, which agent again enters into solution with a liquid; (5) devices in which air or other gas is first compressed, then cooled, and afterward permitted to expand while doing work. These five processes of refrigeration are termed, respectively, the liquefaction process, the vacuum process, the compression process, the absorption process, and the cold-air process.

Liquefaction Process. Liquefaction is one of the most ancient methods employed for artificial cooling. The reduction of the temperature of water by the melting of saltpetre is said to have been known in India at a very remote period. The Romans are said to have cooled wine by immersing the bottle containing it in a second vessel filled with cold water, into which saltpetre was gradually thrown, while at the same time the bottle was rapidly rotated. Freezing water by the use of a mixture of snow or powdered ice and saltpetre was mentioned by Latinus Tancredus in 1607, and wine by means of snow and common salt by Santorio in 1626. The best among the many forms of apparatus for making ice on this principle are probably those of Toselli and Siemens. In Toselli's machine the frigorific agent employed is a mixture of ammonium nitrate and water, which produces a reduction of temperature of about 40° F. The apparatus consists of a vessel in which the solution of the ammonium nitrate is effected and of a can wherein are placed a number of circular molds of different sizes. These molds, previously filled with water, are inserted in the freezing mixture and a thin film of ice is formed round their edges; these tapered tubes of ice are then withdrawn from the molds and placed one inside the other, thus forming a small stick of ice. In Siemens's apparatus the frigorific agent is calcium chloride, whose dissolution in water produces a reduction of temperature of only 30° F., and to admit of this reduction being sufficient to produce ice with water at an initial temperature of 65° F., a heat interchanger is provided in which the spent liquor, which is at a temperature of about 30° F., is employed to cool the water before it is mixed with the salt. The Siemens apparatus has been used in making artificial ice with much success, but, being less economical than more modern ice machines, never came into general use. When these devices or others of the same type are used for cooling purposes, brine is cooled in them and then circulated in the usual manner through a system of circulating pipes. The general law governing the production of cold by frigorific mixtures is that during the liquefaction of a solid a certain amount of heat not indicated by or sensible to the thermometer is absorbed, which heat is abstracted from any surrounding bodies. The absorption of heat from the surrounding bodies is the greater the more rapidly the solid is liquefied.

Vacuum Process. The cooling of liquids on this principle depends upon the conversion of the sensible heat into latent heat (see HEAT) during evaporation, and has been practiced in all ages. A primitive example of this process in its crudest form is the practice in India and other warm countries of placing earthen vessels of water in a natural or artificial draft so that the liquid may be cooled by surface evaporation. The first machine for the production of ice by the vacuum process appears to have been invented in 1755 by Dr. Cullen, who in that year made the discovery that the evaporation of water could be facilitated by the removal of the atmospheric pressure by means of an air pump, to such a degree as to enable him to freeze water even in summer. This apparatus was the parent of all those subsequently designed, but seems not to have been a commercial success. In 1777 Nairne found that by the introduction of sulphuric acid into the receiver for the exhaust the aqueous vapor could be absorbed from the rarefied air and the latter dried, thus preventing the formation of a permanent atmosphere over the water and hindering the continuity of the evaporation. Nairne was followed by other inventors, but it was not until the second quarter of the nineteenth century that Edouard Carré invented a commercially successful machine adapted to produce the *carafes frappés* commonly used in Parisian cafés and restaurants. This machine consisted of a cylindrical vessel intended to contain the charge of concentrated sulphuric acid, of an air pump so arranged that it could be connected to the mouth of the carafe, and of an agitator coupled to the air-pump lever for the purpose of keeping the sulphuric acid in motion. The Carré machine proved most successful for its purpose, and improved forms of the device are still manufactured, the largest of which are capable of producing 80 pounds of ice per day. In 1878 Franz Windhausen patented a vacuum machine, an improved form of which was installed in 1881 at the Aylesbury Dairy, London, England. This machine was nominally capable of producing from 12 to 15 tons of ice per 24 hours. The ice-forming vessels in this machine were six in number, circular in transverse section and slightly

tapered. The mouths of these vessels were connected with the sulphuric-acid chamber and the vacuum pump, and water was admitted to them in fine streams, which offered extended surfaces for evaporation and almost instantly congealed into ice globules which fell to the bottoms of the molds and there froze together. Like the liquefaction process, the vacuum process cannot compete in economy with the more strictly mechanical processes, and vacuum machines are now used only for domestic ice making and similar small installations.

Compression Process. The system of absorbing heat and thus producing cold partly by vaporization and subsequent liquefaction and

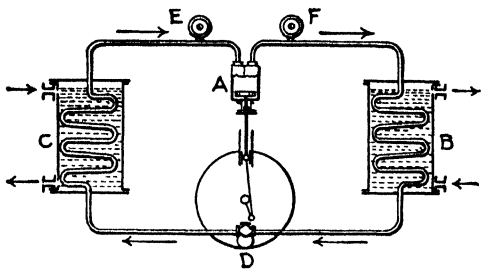


FIG. 1. DIAGRAM ILLUSTRATING THE OPERATION OF A REFRIGERATING MACHINE ON THE COMPRESSION PRINCIPLE.

partly by compression and cooling is in accordance with the well-known law of physics that all substances during the process of passing from a liquid to a gaseous state are bound to absorb a certain amount of heat and while returning from a gaseous to a liquid state to give up or throw off the same amount of heat. Whatever the refrigerating or heat-absorbing agent which may be used, the following cycle of operations is obligatory in all machines working upon this principle: (1) Compression, i.e., the refrigerating agent in gaseous form is subjected to a pressure sufficient to reduce it to a liquid form, this pressure varying with the nature of the agent and the temperature of the condensing water. During this compression a degree of heat is developed in accordance with the amount of pressure to which the gas is subjected or to the volume to which it has to be reduced relatively to that of the gas in order to produce liquefaction. (2) Condensation, during which process the heat developed during the compression of the gas is carried away by forcing the latter through water-cooled pipes, the heat being transferred to the cooling water. At this point the gas is ready to assume the liquid form, in doing which an additional amount of heat is given off to the water. (3) Expansion, during which the liquefied gas is admitted to series of coils of pipe and, being suddenly relieved of pressure, instantly flashes or expands into gaseous form, in doing which, according to the above-mentioned law of physics, it is forced to take a quantity of heat which it draws from the surrounding objects, first, of course, the pipes wherein it is confined, and second, such substances as may be in contact with the pipes and which it is desired to cool, as air, water, and brine. The amount of heat thus abstracted or absorbed is equal to that previously given up to the cooling water in the condenser. This cycle of compression, condensation, and expansion having been completed, the refrigerating agent is in its first state again and is ready for another cycle. The three operations described being essential, all machines operating according to the compression process, however much they may differ in more or less important details, must consist of these main parts, as shown by the diagram Fig. 1: (1) a compressor, *A*, in which the gas is compressed in some convenient and suitable manner; (2) a condensing element or condenser, *B*, in which the gas circulates through water-cooled pipes or coils or their equivalent and liquefaction takes place; (3) an expansion element, *C*, consisting of pipes or coils or other space wherein the gas can reëxpand and perform its work of cooling or refrigerating by

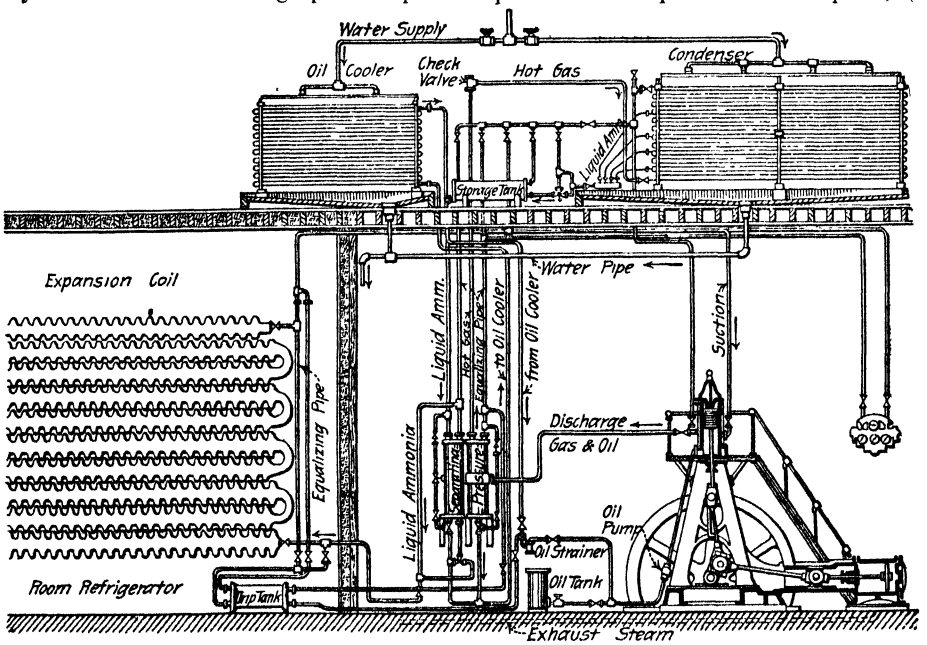

FIG. 2. DIAGRAM SECTION OF A REFRIGERATING PLANT ON AMMONIA COMPRESSION SYSTEM.

abstracting heat from the surrounding objects. In Fig. 1 *D* is a regulating valve, *E* is the low-pressure gauge, and *F* the high-pressure gauge.

Only those liquids are capable of being used as refrigerating agents which possess vapors capable of being liquefied under pressure at ordinary temperatures. There are several such liquids, but those most used in refrigeration are anhydrous ammonia, ether, methyl chloride, sulphurous acid, and carbonic acid. The first compression refrigerating machine was invented by Jacob Perkins in 1834. Subsequent improvements were made by Professor Twining in 1850, by James Harrison in 1856, by Charles Tellier a few years later, and by Van der Weyde, Pictet, and Windhausen at still later dates. The modern refrigerating agent which is most used is anhydrous ammonia, which boils at 40° F. As an illustration of the general compression process and of the machinery and apparatus employed in conducting it, a refrigerating plant on the De La Vergne ammonia compression system may be described. Its characteristic feature consists in the patented system for preventing the occurrence of any leakage of gas taking place past the stuffing box, piston, and valves, and of extracting the heat from the gas during compression by the simple device of injecting into the compressor at each stroke a certain quantity of a special quality oil. Fig. 2 shows diagrammatically a De La Vergne refrigerating plant with all machinery in place. It consists of two sets of apparatus, one set being that required to compress, condense, and expand the ammonia gas and the other set being that required for handling the sealing and cooling oil. Following first the path taken by the ammonia in order to produce the refrigerating effect, there is the compression cylinder, which is of the double-acting type, and the steam-engine cylinder, which is horizontal. The pipe through which the gas is drawn or sucked from the evaporating coils into the compression cylinder is also shown. The gas is discharged by the action of the compressor through the pipe into the pressure tank. From the pressure tank the gas, which still retains the heat due to compression, passes upward through the pipe into the bottom or lower pipe of the condenser, wherein by the cooling action of the cold water running over the pipes the heated gas is first cooled and then liquefied. The ammonia in this liquid condition is then led by the small liquid pipes through the liquid header into the storage tank, whence it flows through into the lower part of the separator, which is constantly maintained at least three-quarters full. By reason of the pressure to which it is now subjected, the liquid ammonia is forced to the expansion cock or valve, through which it is injected into the evaporating or expansion coil which is situated in the room or chamber to be refrigerated or cooled.

The ammonia gas resulting from the expansion and evaporation of the liquid ammonia in the evaporating or expansion coil, having absorbed or taken up the heat from the surrounding atmosphere, passes away back into the compression cylinder, and the cycle of operations just described is again performed. Following now the course of the sealing and cooling oil, which, as previously mentioned, is heated with the gas during compression, this oil is passed from the compression cylinder mingled with ammonia gas into the pressure tank, where most of it separates from the gas and falls to the tank bottom. The heated oil is then conducted through a pipe to the lowermost pipe of the oil cooler, which is similar in construction and operation to the ammonia condenser. After being sufficiently reduced in temperature in the oil cooler the oil flows through the strainer into the oil pump, which is so constructed that it delivers the cooled oil into the compression cylinder, distributing it to either side of the piston or plunger during its compression stroke when it is being compressed and heated. From the compression cylinder the oil proceeds again through the cycle just described. Most of the oil separates from the ammonia gas in the tank, but any small amount that passes on is taken out when it reaches the separating tank. The three salient parts of the apparatus described are the compressor, the condenser, and the expansion coil.

There are numerous compressors of other makes, all of which differ structurally from the De La Vergne and from each other. Condensers are of two general types, surface condensers and submerged condensers In submerged condensers the pipe coils are submerged in the cooling water; Fig. 3 shows a vertical section of such a

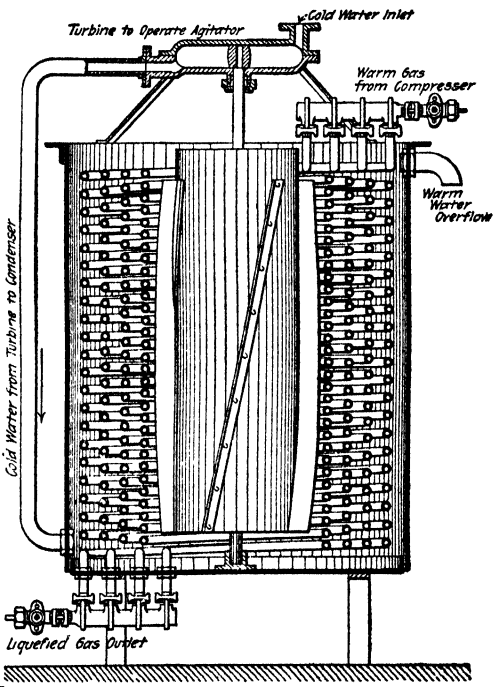

FIG. 3. DIAGRAM SECTION OF CONDENSER FOR LIQUEFYING AMMONIA GAS IN COMPRESSION SYSTEM.

construction. In surface condensers the cooling water is simply allowed to trickle from above on to the pipe coils, whence it falls into a basin and is conducted away. The condensers shown in Fig. 2 are of the surface type. Expansion coils are simply coils of pipe of such section as will give a large amount of radiating surface.

Absorption Process. The absorption process of refrigeration was invented by Ferdinand Carré about the year 1850. It is founded upon the fact of the great capacity possessed by water for absorbing a number of vapors having low boiling points and of their being readily separable therefrom again by heating the combined liquid, hence it is commonly known as the absorption process. The process involves the continuous distillation

of ammoniacal liquor and requires the use of three distinct sets of apparatus: (1) a set for distilling, condensing, and liquefying the ammonia; (2) a set for producing cold by means of a refrigerator and absorber, a condenser, a concentrator, and a rectifier; and (3) a pumping plant for forcing the liquor from the condenser into the generator for redistillation. The three operations are each distinct from the other, but when the plant is actually working they must be continuous and are dependent upon one another, forming separate stages of a closed cycle of operations. An advantage of the absorption process is that the bulk of the heat required for performing the work is applied direct without being transformed into mechanical power. For a general explanation of the absorption process the installation shown by Fig. 4 has been selected. Following first the course of the ammonia gas, we start with the generator and analyzer, which are filled with aqua ammonia. This liquor is treated by the steam coil in the generator and the ammonia evaporates, the gas passing through

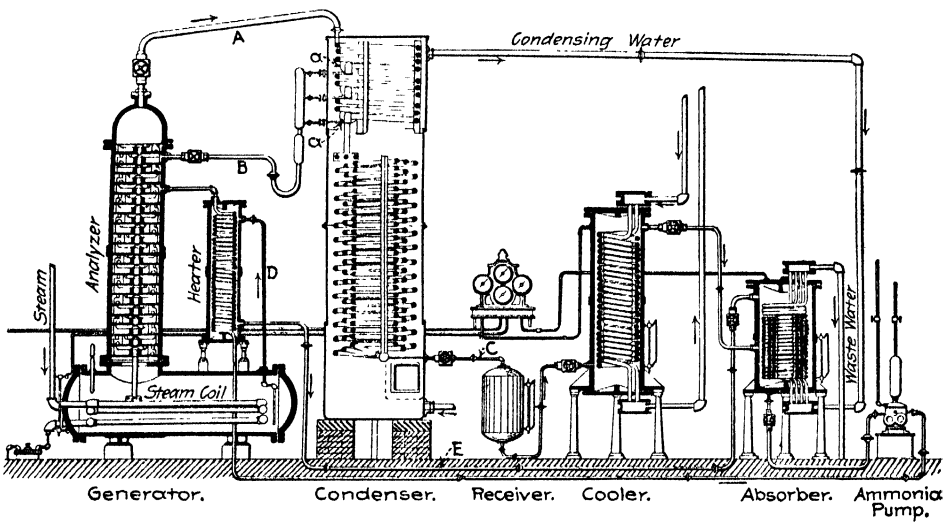

FIG. 4. DIAGRAM SECTION OF REFRIGERATING PLANT IN AMMONIA ABSORPTION SYSTEM.

the pipe *A* to the condenser, which is a cylindrical vessel containing a coil of pipe and filled with water. The upper coils of the condenser pipe are provided with drips, *a a*, in which the water vapor which is mingled with the ammonia gas is condensed and led back to the generator by the pipe *B*. The ammonia gas is cooled while passing down the condenser coil and finally liquefies at the bottom and runs through the pipe *C* into the receiver. From the receiver the liquid ammonia is led into the cooler, where it changes into gas and abstracts heat from the coil of brine pipe. The gas then passes to the absorber, where it meets the weak ammonia solution from the generator and is reabsorbed. The liquor is then pumped from the absorber back into the generator, where it is again heated. When the liquor in the generator is released of its ammonia it passes by the pipe *D* into the heater, and thence by the pipe *E* into the absorber, where it meets the ammonia gas from the cooler and reabsorbs it. The cooling or refrigerating is done by the brine which circulates through the cooler. The foregoing description applies in detail only to one make of machine, but the same general process is followed by all machines.

Cold-Air Process. The cold-air process of refrigeration is based on the principle that the compression of air or other gas generates heat and in its subsequent expansion absorbs heat. The air is first compressed in a cylinder, is then passed through a cooler under pressure, after which it is expanded in a cylinder, the energy of this expansion being used to assist in the compression of the new charge. The great advantages of this system are the absence of all chemicals, its simplicity, and the low temperature that can be obtained. Gorrie is said to have invented cold-air machines and to have designed the first one in 1849. Improvements were made by Alexander Kirk in 1863, by Giffard in 1873, and later by Windhausen, Bell-Coleman, Allen, and others. The greatest difficulties encountered were due to moisture and the clogging of the air ports and valves and to the difficulty of keeping valves tight under the high pressures used.

Water-Vapor Process. One of the recent refrigerating machines is the Westinghouse-Leblanc water-vapor refrigerating machine, which makes use of water vapor and has been found effective for producing temperatures from 35° to 50°, though the former figure is by no means its lowest limit. It is based on the condensation of water vapor.

Cold Storage. A cold-storage plant comprises a refrigerating plant of some kind and a store in which to place the goods, where they can be kept at the desired temperature. Buildings for this purpose vary in size from a single small box or room to large buildings of many stories, containing several rooms in each story. The size of the refrigerating plant varies (*a*) with the size of the store; (*b*) inversely with the temperature to be maintained; and (*c*) with the quality or efficiency of the insulation. The refrigerating processes most used for this purpose are the absorption, the compression, and the cold-air. When the cold-air process is used the air is usually admitted to the store, and after it has taken up the heat there is led back to the compressor. With either of the other processes the refrigeration is effected by one of the following ways: (*a*) by cooling a noncongealable brine, usually a solution of either chloride of sodium (common salt) or chloride of calcium, and then pumping

it through coils of pipe in the store; (*b*) by circulating through the store a current of air that is cooled by passing it over surfaces which are cooled directly by the expansion of the refrigerating agent; (*c*) by circulating through the store a current of air cooled by passing over surfaces that are cooled by brine which is cooled by the refrigerating agent; (*d*) by expanding the gas in coils of pipes in the store; this is the direct expansion system; (*b*) and (*c*) are the cold-blast system. To cool the brine it is usually passed through a double-pipe coil, the inner pipe of which contains the refrigerating agent, the brine being circulated through the annular space between the two pipes. A storage tank is generally provided, to which the brine is returned after it has circulated through the coils in the refrigerating chamber. As this brine is extremely cold, it is very essential that any pipes and tanks through which it circulates should be properly insulated wherever they are exposed to heat, except in the refrigerating chamber.

Construction of Cold Stores. Because of the moisture which is always present when temperatures lower than that of the outside air are maintained, materials which are injured by moisture should be used as little as possible. Wooden buildings are not so suitable as those of brick or concrete for this reason, the wood being particularly liable to injury by rotting. To prevent heat from penetrating the walls, floors, and ceilings, these are covered, usually on the inside, with some substance which is a bad conductor of heat This insulation also should be free from any liability to injury from moisture. It has been found that cork, the bark of the cork oak, is the most suitable substance for this insulation, as it is not injured by moisture and is the best nonconductor of heat known. The amount of insulation required depends on the difference between the temperature of the cold store and the outside air. The greater this difference, the thicker the insulation must be. Temperatures of 10° F. below zero are not uncommon, being sometimes used for the storage of butter. Temperatures ranging from 20° F. to 40° F. are more common, however, meats being usually chilled and stored in about 28° F., fruits and milk at about 34° to 40° F., while fish is kept frozen at from 0° to 10° F. Consult Levey's *Refrigeration Memoranda* (2d ed, Chicago, 1906). Means for the ventilation of cold stores should always be provided. Where a cold-blast system of cooling is used the air may be used over and over almost indefinitely, because the moisture is taken out of the air when it passes over the coils in the refrigerating chamber or bunker room. Most of the impurities and odors are carried by the moisture and are not carried by the dry air. When direct circulation or brine circulation is used separate coils should be installed to furnish fresh cold air when foul air is taken out.

Marine Refrigeration. Marine refrigeration embraces generally the operation of cold stores and ice-making plants on shipboard. These are merely modifications of the plants used on land to adapt them to the special conditions which prevail on shipboard. These conditions are chiefly limited space and the necessity of using a refrigerating agent which is not deleterious to persons or property. To meet the last condition cold-air and carbonic-acid machines offer advantages which have caused them to be very largely adopted. Figure 5 shows a carbonic-acid compression machine designed for use on shipboard.

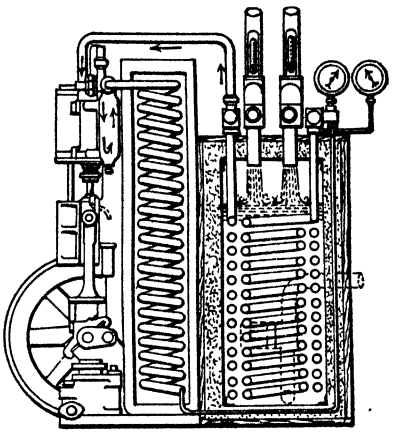

FIG. 5. MARINE TYPE OF CARBONIC-ACID COMPRESSION REFRIGERATING MACHINE.

The main point to be noted is the compactness of the arrangement. Figure 6 is a plan of a cold-storage room on a large passenger steamer which is equipped for carrying fresh meats and has machines of the carbon-dioxide type. The refrigerated holds are forward on the lower and orlop decks. On account of the high temperatures outside the rooms into which the holds are divided, they are insulated very thoroughly, and because of the value of space the most efficient insulation is used. The insulation consists of, first, a double course of tongued and grooved boards with a layer of waterproof paper between them, next a course of Nonpareil sheet cork 1¾ inches thick, and over this a layer of paper covered by a course of tongued and grooved boards. The brine cooling pipes are placed partly overhead and partly on the side walls or bulkheads, thus inducing a circulation of the air in each room, which is necessary if the goods are to be carried on a long voyage. The rails for the meat hooks are of 1-inch galvanized iron pipe and are securely fastened to the beams of the deck above. Thermometer tubes from the upper deck are provided to each chamber, so that the temperature may be ascertained in any part of the chamber when desired.

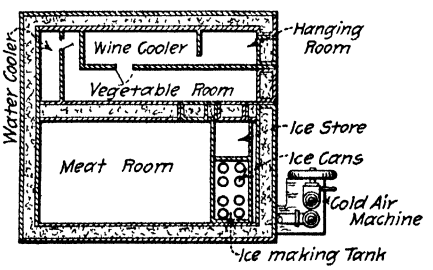

FIG. 6. ARRANGEMENT OF REFRIGERATING PLANT ON LARGE PASSENGER STEAMER.

Ice Making. One of the most important applications of refrigeration is the manufacture of artificial ice. There are several methods of ice manufacture practiced commercially. The great difficulty in manufacturing artificial ice is that of producing a clear, transparent material, for, unless special provisions are made to get rid of it, the air in the water fails to escape, because of the rapid freezing, and an opaque ice contain-

ing air bubbles and of inferior keeping qualities is produced. Five methods may be employed for preventing this opacity and forming clear crystal ice: (1) freezing the water slowly at comparatively high temperatures; (2) agitating the water in cans, molds, or cases during the process of freezing so as to admit of the escape of the imprisoned air; (3) forming thin slabs of ice on what is known as the wall or plate system; (4) freezing the water in shallow stationary cells; and (5) deaërating the water before placing it in the molds or cells. Freezing the water slowly at comparatively high temperatures is simply an imitation of the natural process, the water being exposed in well-insulated rooms to an atmosphere cooled below freezing point. The process is too slow to be successful commercially. In the can system, which is one of the most popular, metal cans are set in a tank containing chilled brine and these cans are filled with the water to be frozen. Extending down into these cans is a bar or rod of wood which is given a swinging motion by suitable mechanism, thus agitating the water and facilitating the escape of the contained air. In the plate or wall system the water to be frozen is placed in a large refrigerator tank which is divided into compartments by a series of parallel hollow partitions. In these hollow partitions brine is circulated, causing a sheet or plate of ice to freeze to both sides of each. When these ice plates have frozen to a thickness of 8 to 12 inches, the cold brine is drained from the partitions and replaced by warm brine, which causes the plates to melt loose, after which they are lifted from the tanks and sawed into blocks. The standard size of plate in the United States is 8 × 16 feet × 11 inches. As in the can system agitators are employed to expel the air from the water during freezing. In the stationary cell system a tank, as in the plate system, is divided by both transverse and longitudinal hollow partitions, so that the ice is frozen in rectangular blocks instead of in long flat plates. The methods of freezing and freeing the ice and of agitating the water are the same as in the plate system. In the deaërating system the water to be frozen is either evaporated by boiling, or frozen in a vacuum, or distilled. The vacuum system is but little used. In the other systems the evaporated or distilled water is frozen either by the can system or plate system.

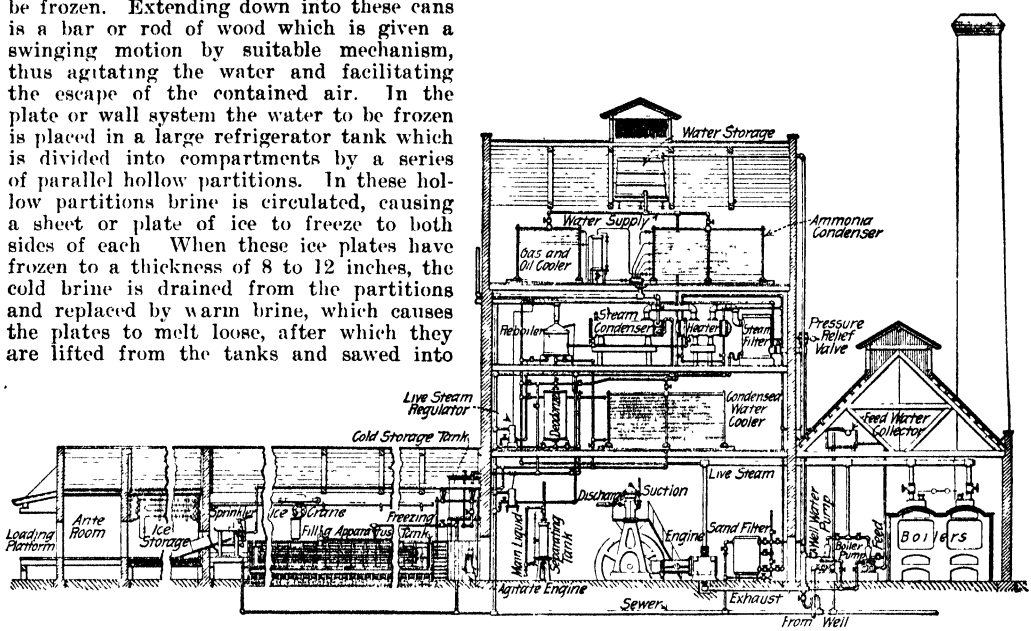

FIG. 7. SECTIONAL DIAGRAM OF ARTIFICIAL ICE-MAKING PLANT; DE LA VERGNE SYSTEM.

Turning now to a specific example of ice making, Fig. 7 shows a plant for making ice on the ammonia compressor can system. The ammonia compressor plant has already been described in a preceding section and will be neglected here. To follow now the water from the well to the loading platform, where it is delivered as ice, we begin with the well-water pump in the boiler house. Water from this pump splits into two currents, one of which rises to the top of the building and discharges into the water-storage tank. This water, as shown by the pipes leading from the tank, flows over the gas and oil cooler and also over the ammonia condenser. From the pans, or cemented floor, on which these stand it flows to the floor below, where it enters the steam condenser. After traversing the condenser it passes through the next floor, runs along the ceiling, and empties into the vertical standpipe (seen to the extreme left) connecting with the sewer. Water from the water storage also flows by a pipe (hidden by the ammonia condenser) to the condensed-water cooler, from the base of which it passes through the floor, runs along the ceiling of the first floor, and empties into the sewer standpipe. This disposes of one current from the well-water pump; the other passes through the sand filter, whence it rises to the third floor and passes through the heater. From this heater it again descends to the feed-water collector in the boiler house, whence it is drawn off by the boiler-feed pump, and by it sent into the boilers. It leaves the boilers in the form of live steam. The pipe conveying this live steam has branches supplying the engine, the well-water pump, the boiler-feed pump, and is continued along the ceiling of the first floor, rising to the third floor, where it is connected with the reboiler and also the steam filter. The purpose of its connection with the reboiler is apparent; the connection with the steam filter is utilized to supply automatically a small quantity of live steam to make up for any deficiency in exhaust steam. Other connections of the live-steam pipe to the various apparatus are shown, which are used for cleaning out. The exhaust steam from the engine, and also for the two water pumps, passes beneath the first floor and rises through the boiler room and outside the main building to the third floor. Before it enters this it has a chance to escape through the pressure-release valve if

for any reason the various apparatus through which it passes should cause sufficient back pressure to impair the proper working of the engine. The exhaust steam passes first into the steam filter, thence into the heater, where it heats the water, which as we have already seen passes through this same heater on its way to the boiler. From the heater it passes to the condenser, thence to the reboiler. From this it goes through the condensed-water cooler to the deodorizer on its way to the cold-storage tank. From the cold-storage tank water is fed by a hose in any can whose place may be rendered vacant by the withdrawal of a can of ice. There we must leave the now thoroughly purified and distilled water in repose for some 60 hours. After this interval of time the can is lifted by the ice crane suspended from the carriage on which it is run down the tank room to the sprinkler. In the sprinkler the can receives a shower bath of warm water and the ice when loosened drops out of itself and glides into the ice-storage room. This ice-storage room is seen to be supplied with refrigerating pipes, so that if the demand is fluctuating the blocks will be preserved intact, only so much being withdrawn into the anteroom as is necessary for immediate use. The following table shows the structural sizes and weights of blocks made by the can system:

WEIGHT OF BLOCKS	Size of can, inches	Time of freezing*
50 pounds	6 × 12 × 26	15 to 25 hours
100 "	8 × 16 × 32	30 " 50 "
150 "	8 × 16 × 42	30 " 50 "
200 "	11 × 22 × 32	50 " 72 "
300 "	11 × 22 × 44	50 " 72 "
400 "	11 × 22 × 57	50 " 72 "

* The time of freezing is with 18° F. brine.

Manufacturing. In general it may be said that refrigeration is applied to all processes of manufacturing where it is desirable or necessary to have at some period a temperature below the normal atmospheric temperature. Some of these processes are brewing, chocolate making, dynamite manufacture, India-rubber manufacture, sugar making, and chemical making. The method of application varies with the process, but it is in general simply a modification of refrigerating processes as applied to cold storage and ice making. See ICE INDUSTRY; LIQUEFACTION OF GASES.

REFRIGERATION OF THE EARTH. That the earth is radiating more heat into space than it receives is evidenced by the fact that the temperature rises as the crust of the earth is penetrated. The flow of heat is always from a higher to a lower temperature, and consequently there is a constant conduction of heat from the interior to the surface of the earth and a loss into space. Determinations of the increase in temperature as the earth's crust is penetrated show that there is a marked variation from one locality to another, this variation depending upon the character of the rocks penetrated, the amount of disturbance they have undergone, and other local conditions. In the well at Wheeling, W. Va., which has a depth of 4500 feet, the rise in temperature has been found to be 1° F. for each 75 feet of descent; in the well at Sperenberg, Prussia (depth 4170 feet), the increase is 1° for 59 feet; and in the Schladabach well, near Leipzig (depth 5740 feet), the increase is 1° for 65 feet. At other localities the rate varies from 15 to 200 feet for 1° F.

Various causes have been suggested for this interior heat of the earth, but considering all the related astronomical and physical considerations it is most probable that it is a remnant of the original nebular heat which has not yet been dissipated and which has been prolonged by the results of the condensation from the nebulous state. By the phrase "age of the earth" is usually understood the time since the earth became practically solid and the present method of cooling by conduction commenced. From data as to the conductivity of the rock materials and the rise in temperature it is possible to make certain estimates as to the age of the earth. Lord Kelvin first made use of this method and concluded that the earth was not less than 20,000,000 nor more than 400,000,000 years old. Later he revised the estimate, placing the limits at 20,000,000 and 40,000,000. Clarence King in an independent investigation concluded that about 24,000,000 years had elapsed since the earth was molten. A later study of the problem was by Becker, who applied the more recent investigations of the involved factors and found that the results point to an age of 60,000,000 or 65,000,000 years, a conclusion that is more nearly in agreement with the views expressed by geologists. It is thought by some physicists that the loss of heat by conduction may be counterbalanced to some extent at least by the influence of radioactive minerals, but it is probable that their influence is limited to the outer shell, in which the acid rocks predominate. Consult Becker, "The Age of the Earth," in *Smithsonian Miscellaneous Collections*, vol. xcvi (Washington, 1910).

REFUGE, CITY OF. See CITY OF REFUGE.

REFUNDERS. See READJUSTERS.

REFUNDING (from *refund*, OF., Fr., *refondre*, to restore, pay back, remodel, from Lat. *refundere*, to pour back, restore, from *re-*, back again, anew + *fundere*, to pour). A financial operation by which a government or corporation changes the terms of an existing debt. In public finance the term is used synonymously with "conversion." A government may refund its debts to secure a change of terms either with respect to rate of interest or with respect to time of payment of principal. Refunding almost always implies a reduction in the rate of interest. An apparent exception to this rule appears in connection with British borrowings of 1915. Subscribers to the new 4½ per cent loan were permitted to refund an equal volume of securities bearing a lower rate into 4½ per cent bonds. Public debts are usually created at a time when public credit is low; accordingly a high rate of interest must be offered to tempt investors. With the restoration of credit it becomes possible for the government to borrow money at a lower rate

of interest; and if the terms of its original debt permit, it is good financial policy to pay off that debt with money borrowed at the lower rate. In practice the holders of the old obligations usually exchange them for the new, so that a refunding operation changes neither the principal of the debt nor the creditors to whom it is due, although technically a new debt has taken the place of the old one.

Quite apart from improvements in public credit, the rate of interest at which a government can borrow money tends constantly to decline owing to the general fall in the rate of interest. Most modern governments are burdened with a more or less permanent debt; accordingly their recent history shows a series of refunding operations, resulting in a steady decline of interest on public debentures. The policy of refunding of debts, while justly popular, naturally meets with the hostility of public creditors, who have at times been powerful enough to influence the action of the government, as in France, 1878–83, when the government could have replaced obligations bearing interest at over 6 per cent by obligations bearing interest at less than 4. The public obligations were largely in the hands of small holders, whose political influence deterred the ministry from undertaking the operation.

Refunding can take place advantageously only when government debentures are above par on the market. It is therefore bad policy for a government in need of funds to sell low-interest bonds below par, since such a policy prevents it from taking advantage of a fall in the rate of interest. See DEBT, PUBLIC; FINANCE; and the financial sections under the various countries.

REFUSE DISPOSAL. See GARBAGE AND REFUSE, DISPOSAL OF.

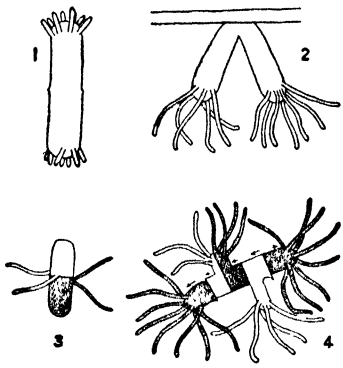
RE'GAL (OF., Olt. *regale*, Fr. *régale*, from Lat *regalis*, regal, from *rex*, king). A small portable finger organ in use in the sixteenth and seventeenth centuries and perhaps earlier. The pipes rested on the air chest, which was filled by the bellows. Its compass was about four octaves, from c to c^3. It occupied about the same position as the modern harmonium (q.v.), of which it was really the precursor. The musical collection of Henry VIII contained 13 regals. The name continued in use as late as 1770.

REGALBUTO, rā'gäl-bōō'tō. A town in Sicily, 26 miles west-northwest of Catania. Salt and sulphur are mined and there is a trade in cereals and wine. Pop. (commune), 1901, 11,038; 1911, 13,614.

REGALDI, rā-gäl'dē, GIUSEPPE (1809–83). An Italian poet, born at Novara. He studied law at Turin, but upon hearing Giustiniani resolved to become, like him, an *improvisatore*, and from 1833 until 1836 traveled much in that capacity and with considerable success. His political opinions, expressed with fire and frankness, involved him in difficulties with the authorities of various Italian towns, and for a time he traveled in the East and in Greece. At the time of his death he was professor of history at the University of Bologna. His works include: *La guerra* (1832); *Poesie estemporanee e pensate* (1839); *Canti* (1840); *Canti nazionali* (1841); *Canti e prose* (1861–65); *Storia e letteratura* (1879), essays. Consult Ettore Stampini, "Giuseppe Regaldi," in Reale Accademia delle Scienze, *Atti*, vol. xlv (Turin, 1910).

REGA'LIA (ML., royal prerogatives), or REGALE, RIGHT OF. A right in ecclesiastical things, claimed by sovereigns in virtue of the royal prerogative, which has frequently been the subject of controversy between kings and popes, especially in the twelfth and thirteenth centuries, in Germany and France. It involved several points as to presentation to benefices, most of which formed the object from time to time of negotiation by concordat; but the most serious conflict arose out of the claim made by the crown to the revenues of vacant benefices, especially bishoprics, and the coördinate claim to keep the benefice or the see vacant for an indefinite period in order to appropriate its revenue. (For the general history of the controversy, see INVESTITURE.) The specific term *Droit de régale*, however, recalls mainly the conflict in France between Louis XIV and certain French bishops, notably those of Alet and Pamiers, who were supported by the Pope, Innocent XI. For a detailed history of this particular strife, consult: Charles Gérin, *Recherches historiques sur l'assemblée du clergé de France de 1682* (2d ed., Paris, 1870); G. J. Phillips, *Das Regalienrecht in Frankreich* (Halle, 1873); E. Michaud, *Louis XIV et Innocent XI* (4 vols., Paris, 1883). (See GALLICAN CHURCH.) The controversy was revived in essence under the French Republic from 1880 to 1906.

REGARD'ANT (OF., looking). A term used in heraldry (q.v.) with reference to an animal whose head is turned backward.



REGEL, rā'gel, EDUARD AUGUST VON (1815–92). A German-Russian botanist, born in Gotha, where he received his horticultural training. He was then employed in the botanical gardens of Bonn, Berlin, and Göttingen. In 1842 he became director of the botanical gardens in Zurich and lecturer at the university there. In 1855 he was made director of the Imperial gardens in St. Petersburg. He did much to promote fruit culture in Russia. His numerous printed works on botany include *Flora Bonnensis* (1841); *Allgemeines Gartenbuch* (1855–58); *Descriptiones Plantarum Novarum in Regionibus Turkestanicis Collectarum* (1873–82); *Aliorum Adhuc Cognitorum Monographia* (1877); *Anlage von Gärten* (1879).

REGEL, (CHRISTOPH) FRITZ (1853–). A German geographer, born at Schloss Tenneberg, near Waltershausen, Gotha. He studied at the University of Jena and taught in secondary schools in Lippstadt, Brunswick, and Jena. In 1884 he became docent and in 1892 professor of geography at the University of Jena; in 1896–97 he traveled in South America, especially Colombia; and in 1899 he became professor of geography at Würzburg. Regel wrote several books on the geography of Thuringia, notably *Thüringen: ein landeskundlicher Grundriss* (1897) and *Landeskunde von Thüringen* (4th ed., 1913); a good deal on Spanish America, especially "Kolumbien" (1899), in the *Bibliothek der Länderkunde*, and *Argentinien* (1913); on commercial geography, *Handelsgeographie* (1912), based on Von Schöning.

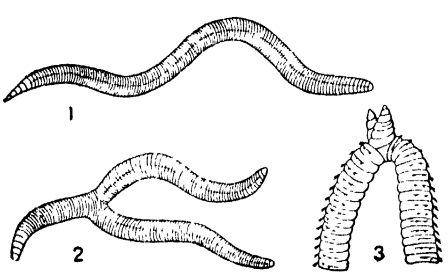
RE'GELA'TION (Lat. *regelatio*, a thawing, from *regelare*, to thaw, from *re-*, back again, anew + *gelare*, to freeze, from *gelu*, frost; connected with Lith. *geluma*, intense cold, Goth. *kalda*, OHG. *kalt*, AS. *ceald*, Eng. *cold*). A term first applied by Faraday to describe the phenomena occurring when two pieces of ice are brought into contact under pressure. The ice melts at the plane of contact and the water thus formed freezes when the pressure is relieved, thus

uniting the two pieces. That ice melts with pressure and that its melting point is lowered as the pressure increases was first shown by Prof. James Thomson and then demonstrated experimentally by his brother, Lord Kelvin, and this property serves to explain the phenomena involved in regelation. A wheel track in the snow is generally covered with a thin film of ice for the reason that the snow melted by the pressure of the wheels freezes as soon as the pressure is removed. A snowball is made by the pressure of the hands causing the snow to melt and then the water is solidified. Consequently if the snow is dry and cold and below the freezing point, the pressure of the hands will not suffice. The well-known experiment of looping a cord or wire around a block of ice and attaching a weight will also show regelation. Here the pressure on the cord melts the ice and allows the string to cut its way through the block, but at the same time the water thus formed is again frozen and the block left in its original solid condition. A union between two pieces of ice will take place when they are in contact under water, even if the temperature is considerably above that of the air. In such a case, however, the capillary action of the film of water between the two faces renders the internal pressure less than the external and acts to bring the two pieces together with pressure The phenomenon of regelation is also quoted to explain the formation and movement of glaciers. The glacier (q.v.) in its progressive movement acts much as a viscous solid, the top moving faster than the bottom and the middle faster than the sides. The pressure of the vast quantity of snow above melts the ice or snow at the bottom, and thus, escaping and flowing down, freezes and solidifies, a gradual slipping away of the base occurring. As the foot of the glacier descends it reaches warmer regions, so that melting will take place with less pressure and the water will drain off. In this way it is possible to explain much of the formation and movement of glaciers, though of course the problem is very complex and other causes exert powerful influences. Consult Thomas Preston, *Theory of Heat* (2d ed., New York, 1904). See HEAT.

REGEN'ERA'TION (Lat. *regeneratio*, from *regenerare*, to generate anew, from *re-*, back again, anew + *generare*, to beget, from *genus*, family). Replacement of lost parts, renewal of organs, or completion of an organism from a part. In 1744 the Swiss naturalist Trembley found that on cutting hydras in two, or slicing them into thin rings, from each ring grew out a crown of tentacles; and in splitting them into longitudinal strips each portion became a well-shaped hydra. Finally he turned one inside out and in a few days the evaginated hydra swallowed pieces of meat, though its former stomach lining had now become its skin. Bonnet found that from the same region of a worm, like the earthworm, a head or tail may arise according to whether that region happens to lie at the anterior or posterior end of the cut surface. Thus, if a worm (*Lumbriculus*) be cut into two pieces, a new tail will develop from the posterior end of the anterior piece and a new head from the front end of the posterior piece. In another species of fresh-water annelid Bonnet found that a new tail developed at the anterior end of the posterior piece, and not a head. As the result of recent experiments on the earthworm it is ascertained that if from one to five of the anterior segments be cut off, the same number come back; if more are cut off, the process of regeneration begins only after a longer interval, and only four or five segments come back as a rule; if the cut be behind the middle, the time before regeneration

REGENERATION OF HYDRA.

1, two anterior pieces of hydra united by their aboral ends; 2, hydra split in two, hanging vertically downward; 3, two posterior ends of hydra united by oral surfaces; 4, five pieces united as shown by arrows. (After Morgan.)



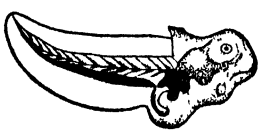
begins is still longer, and fewer worms succeed in regenerating at all. Each end of the body can regenerate in its own direction only.

The effect produced by external factors in experiments on regeneration is noteworthy. A hydroid (*Eudendrium*) failed to develop new heads when kept in the dark, but when placed in the light the new heads quickly appeared, showing that light acts as a stimulus; and instead of a head a root will develop at the distal end of a piece if that end be brought into contact with some fixed object, and conversely a new head will appear at either the nearest or farthest end if the end be freely surrounded with water; in this case the external agent is the stimulus which determines the differentiation of the part; and experiments have produced some extremely curious manifestations of how this stimulus acts.

It is of some theoretical interest to know whether the old cells directly form the new tissue or whether reserve cells are present that bring about the result. From experiments thus far made Morgan thinks that this may vary with different forms. In *Planaria*, a flatworm, a new head forms on the anterior end of the posterior half of the worm, but the entire anterior half is never replaced by new tissue. In this same planarian Randolph has discovered a most important relation existing between the old and the new parts. If a planarian be cut in two longitudinally in the median plane, the right half regenerates a new left half of the same size as the part removed, and the left half also develops a new right half of corresponding size. If, however, the worm be cut longitudinally into a larger and a smaller strip, the former replaces as much as was contained in the smaller part removed, but the smaller part does not develop the lost larger part, but forms only as much new tissue at its cut side as is about equivalent to its own breadth.

Animal Grafting. Although this subject is not one of practical importance as regards animals, it is a matter of interest connected with the regeneration of the grafted parts, and in the case of the lower animals may lead, if portions

of different species or genera are grafted upon each other, to results bearing on heredity. The first experiments in animal grafting are the famous experiments with the hydras by Trembley. He found that if a hydra is cut in two, the pieces can be reunited by their cut surfaces, the result being a complete animal. He also successfully united the head end of one hydra with the posterior half of another; but he failed to obtain a permanent union between individuals of different species. Lateral grafts were found to differ from lateral buds, the latter after four or five days separating by constricting at the base. Peebles succeeded in grafting in *Tubularia, Hydractinia*, etc. Joest has succeeded in grafting earthworms, producing double-headed and double-tailed specimens, also in splicing, making a long worm out of three separate pieces; he grafted or spliced together with such success worms of different species, and even of different genera (*Lumbricus rubellus* and *Allobophora terrestris*), though it was a more difficult undertaking; but the new worm "reacted as a single individual, and lived for eight months." As to more specialized animals, as insects and vertebrates, it appears that as in Crampton's experiments with grafting the pupæ of silk moths (*Philosamia cynthia, Samia cecropia*, etc), like tissues of two components fuse with like, while unlike tissues become organically united by connective tissues. He grafted small pieces upon entire pupæ, *Philosamia cynthia* upon *Samia cecropia*, *Callosamia promethea* upon *Samia cecropia*, but the fusion



REGENERATION OF WORMS.

1, union of two pieces of *Allobophora terrestris* in normal position 22 months after operation. 2, piece of *Lumbricus rubellus* grafted on side of body of another individual to produce a double-tailed worm. 3, union of two worms (by anterior ends) from each of which eight anterior segments had been removed. (After Morgan.)

was entirely a superficial one, there being no internal connection between the organs of the graft, such as the muscles of the legs with those of the stock. Tandem unions were more successful, a pupa deprived of the head and part of the thorax being joined to another deprived of its abdomen back of the fourth segment. The moths thus resulting had a long body with two sets of wings and legs, yet there was no internal fusion of organs, only the skin and appendages and wings sharing in the fusion. Twin unions were produced by aboral and oral poles, also lateral twin unions; these experiments were easily performed because only a little of each component was cut away.

The grafting of tadpoles by Born (1896–97) has excited much interest. If the anterior half of one tadpole was fused with the hinder half of the same or another tadpole, a single individual was formed which was kept alive in several cases until the time of metamorphosis. If the head of a tadpole is cut off and grafted upon the side of the body of another tadpole, the head will remain alive and continue to develop in its new position, and may grow to the size of that of the stock. He succeeded in uniting tadpoles of

GRAFTING A FROG.

A combination in which the anterior part of *Rana esculenta* was united to the posterior part of *Rana larvalis*. The blood of the posterior component was driven through the vessels by the action of the heart of the anterior component. The animal lived for 17 days. (After Morgan)

different species in several different ways, i.e., by their heads or by their ventral surfaces, or longer and shorter tadpoles were made by using pieces longer or shorter than a half. In all these cases there was no regeneration (says Morgan) at the place of union, and the internal organs, the digestive tract, nervous system, and blood vessels unite when brought into contact. When like organs are brought together the substance of one unites directly with the substance of the other, and if the organ is a hollow one, as is the digestive tract or the nerve cord, their cavities also become continuous. Born succeeded in grafting tadpoles even of different genera. It should be observed that in all these and other combinations each developing part retains its specific characters, "and although in several cases one part received its nourishment from the other through the common circulation, yet no influence of one component on the other could be observed." Morgan states that in the mammals it is impossible to carry out grafting experiments on the same scale as those described in lower forms. Thus, we could not graft an arm of a man upon another. While the tissue might have the power to unite, the difficulty would be in supplying the grafted arm with nourishment, etc., during the long time required for the union to take place. Yet smaller parts of the body may be successfully grafted, and there are, he says, several recorded instances in which parts of a finger, or of the nose, are said to have been cut off and to have reunited after being quickly put back in place. As regards cases of grafting, Hunter and also Duhamel grafted the spur of a young cock upon the comb, where it continued to grow to its normal size. Other similar experiments have met with varying success.

Transplantation of Skin. Cases of this sort of plastic surgery are becoming frequent. Morgan states that pieces of human skin may be without great difficulty grafted upon an exposed surface, "and it has been said that small pieces succeed better than large ones, owing, most probably, to their being able to absorb sufficient oxygen, etc., and keep alive until new blood vessels have grown into the grafted piece." The skin of the negro has been transplanted upon a white man. In many cases the transplanted skin has remained alive for a time, yet later it was thrown off by new skin growing under it and replacing it. Even grafting of internal organs is now attempted with more or less success in operative surgery. The results of grafting bone, etc., show, adds Morgan, that all kinds of tissue may continue to live, and the cells multiply in different parts of the body, but there

seems to be nothing in these cases comparable to a regeneration of the entire organ. In the new situation the cells often assume an entirely new arrangement. After a period of activity a process of degeneration commences and the piece atrophies. See RHINOPLASTIC OPERATION; SKIN GRAFTING.

Bibliography. T. H. Morgan, *Regeneration* (New York, 1901), containing a full bibliography; Jacques Loeb, *Studies in General Physiology* (2 vols., Chicago, 1905); id., *Dynamics of Living Matter* (New York, 1906).

REGENERATION. A term used in theology to indicate either the new spiritual life of men when they become Christians or the divine agency which produces that new life. The words of Christ to Nicodemus, "Verily, verily, I say unto thee, except a man be born again, he cannot see the kingdom of God," are accepted as the statement of the universal necessity of regeneration and are the origin of the figure which the term expresses. In the view of the Roman Catholic and Eastern churches and of the High Church school among Anglicans, the change is inseparably connected with baptism, always in the case of infants and of those adults who interpose no obstacle to divine grace. In this view baptism constitutes always a real point of transition from the natural to the spiritual life, so that every baptized person—or at least every rightly baptized person—has already become a Christian, although he may fall away from the grace that he has received. According to most Protestants regeneration (including conversion) is a special, conscious process which takes place independently of baptism or of any other outward fact or ceremony. It implies a sensible experience—an awakening whereby men come to see the evil of sin and the divine displeasure against sin and, through the Holy Spirit, are born again, put away their former evil life, and begin to live a new, divine life. The controversy as to the meaning and method of regeneration was especially acute in the Anglican communion in the nineteenth century. The Gorham Judgment (see GORHAM CONTROVERSY) agitated the entire Church of England in the forties. Present thought is largely occupied with the experiences of the new religious life and their psychological causes, rather than with theories of their divine origin. Consult: G. S. Faber, *The Primitive Doctrine of Regeneration* (London, 1840); W. Anderson, *Treatise on Regeneration* (2d ed., Philadelphia, 1871); G. T. Fox, *Doctrine of Regeneration* (London, 1880); Albrecht Ritschl, *The Christian Doctrine of Justification and Reconciliation*, English translation by Mackintosh and Macaulay (New York, 1900).

REGENERATION, IN PLANTS. In general when a portion of a plant is removed the plant replaces it with a similar or different part. This process of replacing a lost organ is called regeneration. In more complex plant bodies regeneration may occur in either of two ways: (1) the removed part may be formed directly from the cut or broken surface without the intermediate development of wound tissue or callus, or (2) it may develop from callus or previously formed primordia in the general region of the wound. The first type of regeneration is often called restitution. Reparation is also sometimes used to cover this type of generation. In fact, various authors differ considerably in the meaning given to the three words "regeneration," "restitution," and "reparation." The latter type of regeneration mentioned above is the far more common method, but restitution is also of rather frequent occurrence. When 0.5 millimeter of the root tip, the lateral half of many vegetative organs, or a portion of the leaf of Gesneriaceæ is removed, it is replaced by restitution. If a greater portion of the primary root is removed, a lower lateral root primordium becomes radial, grows downward, and acts as a primary root. The very general phenomena of shoots regenerating shoots or roots and of roots regenerating shoots, leaves, and roots involve callus formation or development of primordia already existing. Such primordia may be visible to the naked eye or only to the microscope or to neither.

Propagation by cuttings is much used by florists and horticulturists. The process is, of course, limited to those plants having considerable capacity of regeneration, and this capacity varies greatly with different plants. On one extreme are those incapable of reproducing by cuttings and on the other those that will regenerate from a fragment of the leaf, as *Begonia*. Under certain conditions *Bryophyllum* will produce new plants at the vein tips of the leaves, even when the leaves are still intact.

Restitution of lost parts occurs even in filamentous plants showing basal and apical regions. In *Cladophora* the separation of the individual cells causes each cell to develop a rhizoid at its base and a new green cell at its tip. This is a method of substituting for the lost parts of the filament. The power of individual cells to behave thus is common in thallophytes, but rather limited in higher forms, due in part to specialization introducing nutritive and other difficulties. This ability of individual cells to replace lost parts leads physiologists to conclude that in each protoplast there once dwelt the ability to form an entire plant of the same species. If such capacity existed it would not be realized unless the cells were separated, because of correlations (q.v.) existing between cells and groups of cells With time and specialization many plant cells have lost this capacity; indeed, many plants have lost the capacity to regenerate even from large portions of themselves, as was mentioned above. Regeneration is always intimately connected with correlations and polarity. Several other examples of regeneration are discussed under these topics. Consult Jost, *Lectures on Plant Physiology*, English translation by R. J. H. Gibson (Oxford, 1914).

REGENSBURG, rā'gĕns-bo͝orK, or RATISBON. A city of Bavaria, Germany, capital of the Upper Palatinate, situated on the Danube opposite the mouth of the Regen, 65 miles north-northeast of Munich (Map: Germany, E 4). It is distinctly mediæval in appearance, with narrow, crooked streets and ancient houses with loopholed towers and coats of arms. A stone bridge dating from the twelfth century connects Regensburg with the suburb of Stadtamhof on the opposite bank of the Danube. The cathedral, begun in 1275 and completed in 1524 with the exception of the towers, is pure German Gothic. It contains many fine monuments and other objects of art. The church of St. Ulrich, dating from 1250, contains a valuable historical collection. The Rathaus, dating partly from the fifteenth century, is interesting as the seat of the Imperial Diet from 1663 to 1806. Another building of historical interest is the inn Zum Goldnen Kreuz, where Charles V lodged during the Diet of 1547 and

where he met Barbara von Blomberg, the mother of Don John of Austria. The villa of the King of Bavaria is a magnificent building in the Gothic style, commanding a fine view of the surrounding country. There are a number of seminaries and schools of religious music, glass painting, and agriculture. Interesting collections are owned by the local historical and natural-history societies. There are manufactures of paints, porcelain ware and pottery, machinery and other iron and steel products, knit goods and cloth, musical instruments, rifles, spirits, etc. Boat building and book printing and binding are also industries of importance. Pop., 1900, 45,426; 1910, 52,624, principally Roman Catholics. Near Regensburg is the German Temple of Fame, called the Valhalla (q.v.).

Regensburg was the Celtic settlement of Radasbona, called by the Romans Castra Regina. It was the residence of the early dukes of Bavaria and became the seat of the bishopric of Regensburg in the eighth century. From the eleventh century to the close of the Middle Ages Regensburg was one of the most important cities of south Germany and carried on a flourishing trade with the East. It was early raised to the position of a free Imperial city. As the frequent residence of the German emperors Regensburg was the scene of many important diets, and became the permanent seat of the Diet in 1663. In the territorial changes following the Treaty of Lunéville in 1801 it was assigned to Dalberg (q.v.). In 1810 it passed to Bavaria. Consult: Gumpelzhaimer, *Regensburger Geschichte, Sagen und Merkwürdigkeiten* (Regensburg, 1830-38); *Chroniken der deutschen Städte*, vol. xv (Leipzig, 1878); Küsser, *Alt- und Jung-Regensburg* (Regensburg, 1895); Walderdorff, *Regensburg in seiner Vergangenheit und Gegenwart* (ib., 1896), Fink, *Regensburg in seiner Vorzeit und Gegenwart* (ib., 1900).

REGENT BIRD. See BOWER BIRD.

REGENT DIAMOND. See PITT DIAMOND.

REGENT'S PARK. One of the largest London parks, covering 472 acres and containing zoölogical and botanical gardens. It was laid out in the time of George III on the site of the earlier Marylebone Park, once filled with game, subsequently cleared for a pasture, again replanted, and named for the Prince Regent (George IV).

REGENT STREET. A noted London street, a mile in length, laid out in 1813 to connect Carlton House, the Prince Regent's residence, with Regent's Park. It contains the finest shops of the city.

REGER, rā'gẽr, MAX (1873–1916). A German composer. He was born at Brand in Bavaria, March 19, 1873. His father and the organist Lindner were his first teachers. In 1890 he went to Riemann (q.v.) in Sondershausen, and when in the following year Riemann became professor at the conservatory in Wiesbaden, Reger followed him. Until 1895 he continued his studies with that eminent scholar, holding at the same time an appointment as teacher of piano at the conservatory. Having completed his year of military service (1896–97), he returned to his home in Weiden, whither his parents had removed in 1874. In 1901 he settled in Munich, where in 1905–06 he taught counterpoint at the Royal Academy. The following year he was called to Leipzig as music director at the university, teacher of composition at the conservatory, and conductor of the St. Paul's Verein. At the end of the first year he resigned his position at the university, but was made professor, and at the same time the University of Jena conferred upon him the degree of Ph.D. In 1911 the Duke of Meiningen appointed him court conductor of the famous Meiningen Orchestra. (See BÜLOW, HANS VON.) Among contemporaneous composers Reger occupies a unique position, in many respects similar to that of Brahms in the nineteenth century. Both cultivate the classical and polyphonic forms, the music of both is austere, both are rather aloof from the public of their time; the stage evidently allures Reger as little as it did Brahms. But in one respect they are utterly unlike. Brahms frequently produces his most grandiose effects by the very simplest means; Reger seems to be incapable of writing anything simple. Riemann states that Reger's earliest (unpublished) compositions bristled with contrapuntal complexities that seriously hampered his naturally strong inventive power. Even in his mature work the composer did not succeed in curbing this tendency. On the contrary he added such harmonic intricacies as to render the technical analysis of a Reger composition a severe problem and the actual hearing of these very long works rather a strain than a pleasure. And yet it would seem that in the future the musical creed of what at present constitutes only a small circle may be accepted as substantially true. Those who have succeeded in deriving enjoyment from this new master's works summarize the development of pure instrumental music as follows: Bach, Beethoven, Brahms, Reger. One thing, however, is certain even now: as a composer for the organ Reger surpasses all except the mighty Bach. Also a very rapid and prolific writer, he reached his op. 100 at the age of 34. The more important of his compositions for the organ are: *Fantasie und Fuge*, C minor, op. 29; *Fantasie and Fuge über B–A–C–H*, op. 46; *Symphonische Fantasie und Fuge*, op. 57; *Variationen und Fuge über ein Originalthema*, op. 73; *Introduktion, Passacaglia, und Fuge*, op. 127; two sonatas in F sharp minor, op. 33, and D minor, op. 60. For orchestra his principal works are: *Sinfonietta*, op. 90; *Serenade*, op. 95; *Variationen und Fuge über ein Thema von J. A. Hiller*, op. 100; *Symphonischer Prolog zu einer Tragödie*, op. 108; *Ouverture zu einem Lustspiel*, op. 120; *Romantische Suite*, op. 125; *Vier Tonbilder nach Böcklin*, op. 128; *Ballet Suite*, op. 130; *Violinkonzert*, op. 101; *Klavierkonzert*, op. 114. Reger wrote also several choral works with orchestra, a great deal of chamber music, piano works (two and four hands), and over 300 songs. Besides he transcribed for piano numerous songs and orchestral works by other composers. Especially noteworthy among these transcriptions are his very effective but extremely difficult arrangements of a number of Bach's organ works. His own harmonic innovations he defended and explained in an able book, *Beiträge zur Modulationslehre* (1903). Consult R. Braungart, *Max Reger*, in "Monographien moderner Musiker" (Leipzig, 1907), and M. Hehemann, *Max Reger: eine Studie über moderne Musik* (Munich, 1911).

REGGIO, rĕd'jô, DUKE OF. See OUDINOT, C. N.

REGGIO DI CALABRIA, rĕd'jô dê kà-lä'-brê-à. The capital of the Province of Reggio di Calabria, Italy, situated on the Strait of Messina, 8 miles southeast of Messina in Sicily (Map: Italy, E 5). The climate is salubrious and the

scenery beautiful. Behind the city rises Aspromonte, where Garibaldi was taken prisoner in 1862. The city has a modern cathedral, an old castle, a statue of Garibaldi, a museum of antiquities, a public library, a lyceum, a technical school, and a seminary. There are manufactures of linens, silks, perfumes, olive oil, etc. The trade is chiefly in wine, fruit, grain, and fish. Pop. (commune), 1901, 44,415; 1911, 43,162; 1914 (est.), 42,996.

Reggio is the ancient Regium, founded by fugitives from Messina about 723 B.C. In 387 B.C. it was destroyed by Dionysius of Syracuse, but became a prosperous city again under the Romans. During the Middle Ages it was plundered by Goths, Saracens, and Turks. It was almost totally destroyed by the great earthquake of 1783, and again in December, 1908, but has since been rebuilt on modern lines.

REGGIO NELL' EMILIA, nĕl'lȧ-mē'lyȧ. The capital of the Province of Reggio nell' Emilia, Italy, situated on a branch of the Po and on the Piacenza-Bologna and other railroads, 16 miles west-northwest of Modena (Map: Italy, C 2). It is surrounded by walls and has broad and regular streets. The fifteenth-century cathedral is embellished with statues and monuments. Some of the churches, notably Madonna della Ghiara, contain famous frescoes. The theatre is one of the finest in Italy. There are a museum with a natural-history collection and a library with 56,500 volumes and 1051 valuable manuscripts; also a lyceum, a technical institute, and a seminary. The city lies in a fertile district and trades in wine, rice, and flax. There are manufactures of cotton and silk stuffs, brooms, leather, and cement. Pop. (commune), 1901, 58,490; 1911, 70,419. Reggio, the ancient Regium Lepidi, was a flourishing city under the Romans. It was made the seat of a bishopric in 450. In the twelfth century it became a republic, but passed into the possession of the Este family in 1290. It was repeatedly wrested from them, but was permanently secured early in the sixteenth century, and afterward shared the fortunes of Modena. Reggio is the birthplace of Ariosto.

REGIA, rē'jĭ-ȧ (Lat., royal house). The official residence of the pontifex maximus at Rome, situated on the Sacred Way, in the Forum, in the space between the temple of Faustina and the temple of Vesta. In it were chapels to Mars and Ops (see SATURN), a hall for religious conventions, and the archives of the priesthood. On its walls were engraved the *Fasti Consulares* and the *Fasti Triumphales* (see FASTI), fragments of which were discovered in 1543, when the building was demolished and its material used in the construction of St. Peter's. Consult Christian Hülsen, *The Roman Forum: Its History and its Monuments*, English translation by J. B. Carter (2d ed., New York, 1909), and S. B. Platner, *The Topography and Monuments of Ancient Rome* (2d ed., Boston, 1911).

REGICIDES, rĕj'ĭ-sīdz (from Lat. *rex*, king + *-cida*, assassin, from *cædere*, to kill). A name given in English history to those persons directly responsible for the execution of Charles I, and especially to those members of the High Court of Justice, 67 in number, who on Jan. 27, 1649, voted for his execution. Fifty-eight of the 67, besides Ingoldsby, who was not present when sentence was pronounced, ultimately signed the death warrant. In 1660, preparatory to his return, Charles II issued the Declaration of Breda, whereby pardon was promised to all excepting such as Parliament might afterward except. The Convention Parliament later passed an act of indemnity, but with many exceptions. Nineteen regicides, who had surrendered voluntarily, were kept in prison, together with six others, till their death, as far as is known, though they were never tried. Ten were executed immediately and three others were caught in Holland, brought to England, and executed. Many lived in exile for the rest of their lives, Goffe, Whalley, and Dixwell (qq.v.) in the American Colonies. But even the dead were not spared, the bodies of some being exhumed, dragged to Tyburn, and there burnt, after having been exposed on the gallows. Consult Mark Noble, *The Lives of the English Regicides* (2 vols., London, 1798), and Emmanuel Régis, *Les régicides dans l'histoire et dans le présent: étude medico-psychologique* (Paris, 1890).

REGICIDES' CAVE, or JUDGES' CAVE. A cavern near the top of West Rock, a cliff at New Haven, Conn., of interest to visitors. It was the place of concealment of the regicides Goffe and Whalley in 1661.

REGIL'LUS, LAKE. Anciently a small lake of Latium, to the southeast of Rome, somewhere about the foot of the Tusculan hills, probably occupying an extinct volcanic crater at a place called Cornufelle, near the modern Frascati. Lake Regillus is celebrated in the semilegendary history of Rome as the scene (496 B.C.) of a great battle between the Romans under Aulus Postumius and the Latins, on behalf of the banished Tarquin, under O. Mamilius. Consult Macaulay, *Lays of Ancient Rome* (many eds., a good one being that of New York, 1909).

REG'IMENT (Lat. *regimentum*, government, from *regere*, to govern). A military organization consisting of from two to four battalions (according to the army organization of the various nations and the arm of the service). In the United States army the cavalry, field artillery, and infantry regiments are administrative units, commanded by colonels. The cavalry regiment consists of 12 troops organized as squadrons, each commanded by a major; total war strength, 51 officers, 1236 enlisted men, 1294 mounts. The field artillery regiment consists of 6 batteries organized as 2 battalions, each commanded by a major; total war strength, 42 officers, 1128 enlisted men, 1062 horses. The infantry regiment consists of 12 companies organized into 3 battalions, each commanded by a major; total war strength, 51 officers, 1836 enlisted men. The regiment is the administrative unit. The battalion, or squadron, in a regiment is not an administrative unit and has no separate records; it is purely a tactical unit conveniently organized for instruction or manœuvre and particularly for combat, either as an integral part of the regiment or when acting independently.

The regimental organization of the English army is somewhat different, usually two regular battalions, commanded by a lieutenant colonel, form the regular regiment. With these two regular battalions are associated two or more militia or territorial battalions. The different battalions have their own system of administration, often serving in different parts of the Empire. The Foot Guards have three battalions, with the exception of the Irish Guards, which have but one. The Royal Engineers is a regiment by name, although consisting of more than 10,000 men.

The continental European organization is similar to that of the United States, with, usually, a greater number of rifles per infantry battalion. For further details, see ARMY ORGANIZATION; BATTALION; COMPANY; and *Armies* under the different countries.

REGIMENTAL COURT-MARTIAL. Under the provisions of the Act of March 2, 1913, the regimental court-martial and the garrison court-martial were both abolished and replaced by the special court-martial. See COURTS, MILITARY, *Special Courts-Martial.*

REGINA, rē-jī'nà. A city and the capital of Saskatchewan, Canada, situated on the Canadian Pacific, the Canadian Northern, and the Grand Trunk Pacific railroads, 357 miles by rail west of Winnipeg (Map: Saskatchewan, F 7). The city is well laid out, with broad well-paved streets and several fine parks. It possesses the provincial Parliament buildings and Supreme Court, two hospitals, a normal school, Regina College (Methodist). St. Chad's College, Presbyterian College, and is the western headquarters of the Royal Northwest Mounted Police. The industrial establishments include flour mills, foundries and machine shops, elevators, wire and steel works, breweries, abattoirs, tanneries, and manufactories of sashes and doors, pressed bricks, grain cleaners, aërated waters, cigars, tractors, cement blocks, soap, farm implements, automobiles, mattresses, threshers, and carriages. There is a government creamery. Regina is the centre of a great wheat-producing area and the chief distributing point for the Canadian Middle West, especially for farm implements and machines. Pop., 1901, 2249; 1911, 30,213; 1915 (local est.), 47,500.

RE'GIOMONTA'NUS (1436–76). A German mathematician and astronomer, whose real name was Johannes Muller He was born near Königsberg (whence his Latin name), was educated at Vienna, and was a pupil of George Purbach (q.v.). He collected numerous Greek manuscripts and translated many of them, especially the works of Ptolemy, Apollonius, Archimedes, and Hero of Alexandria. He also brought the algebra of Diophantus to the notice of Europeans. Regiomontanus was the author of a treatise on plane and spherical trigonometry, *De Triangulis Omnimodis* (1533), which contained the sine and cosine. Adopting the half chord of the Arabs, he constructed tables of sines and tangents. His work on arithmetic and algebra, entitled *Algerithmus Demonstratus* (1534), was among the first containing symbolic algebra. He established an observatory and printing press in Nuremberg and produced tables of eclipses and works on astronomy and astrology. He was called to Rome by Sixtus IV to revise the calendar, but died there the following year and was buried in the Pantheon. His works include: *De Quadratura Circuli* (1463); *De Doctrina Triangulorum* (1463); *Calendarium Novum* (1473); *Ephemerides ab Anno 1475–1506* (1474); *Disputationes Dialogus contra Gerhardi Cremonensis in Planetarum Theorias Deliramenta* (1475); *De Reformatione Calendarii* (1484); *De Cometæ Magnitudine Longitudineque* (1531); *Tabulæ Directionum Profectionumque* (1575). A collection of his letters was edited by Murr (Nuremberg, 1786). Consult Alexander Ziegler, *Regiomontanus: ein geistiger Vorläufer des Columbus* (Dresden, 1874).

REG'ISTER (ML. *register, registra, registrum,* variants of *regestum,* register, books of record, from Lat. *regestus,* p.p. of *regerere,* to record, from *re-,* back again, anew + *gerere,* to carry). In music, the compass of a voice or instrument; specifically a series of tones produced by the same mechanism and having the same quality. Generally considered, there are three registers in the female voice and two in the male voice. Those notes which proceed naturally and freely from the voice constitute the so-called chest register. The head register embraces those notes which are produced by a somewhat strained contraction of the glottis, while the falsetto register is that midway between the two. In speaking of the organ the term is equivalent to "stop." See ALTO; BARYTONE; BASS; MEZZO; PHONETICS; SINGING; SOPRANO; TENOR; VOICE.

REGISTER, CASH. See CALCULATING MACHINES.

REGISTRATION OF CHATTEL MORTGAGES. The statutes of many of the United States provide for the registration of chattel mortgages in addition to filing the instruments. This system is designed solely to give notice to the public, and does not combine the guaranty of validity secured by registration of titles to land in some States. The names of the parties, the amount secured, and date of execution, are usually the only facts registered, and therefore it practically amounts only to an index of the mortgages on file. See TITLE, REGISTRATION OF.

REGISTRATION OF TITLE. See TITLE, REGISTRATION OF.

REGISTRY OF MAIL MATTER. See POST OFFICE.

REGISTRY OF VESSELS. Merchant vessels of the United States which are engaged in the foreign trade are registered in the office of the collector of customs of their home port. A registry certificate is issued assigning to the vessel her official number, signal letters, date of construction, home port (residence of managing owner), name of managing or principal owner, and her dimensions and tonnage in accordance with the information furnished by the surveying officer. Vessels engaged in the coasting trade or upon inland waters are enrolled and obtain a certificate of enrollment instead of registry. Vessels under construction are built in conformity with the rules of one of the marine registry societies and under the supervision of one of the society's surveyors. This is done in order to insure a suitable classification for marine insurance. See LOAD-LINE MARKS OF VESSELS; *Ship, Classification for Marine Insurance* under the head of SHIP AND SHIPPING.

RE'GIUM. See REGGIO DI CALABRIA.

REGIUM LEPI'DI. See REGGIO NELL' EMILIA.

RE'GIUS. See RHEGIUS.

REGIUS PROFESSOR (Lat., royal professor). The name given to the professors the patronage of whose chairs is vested in the crown. In the English universities the term is especially applied to those professorships founded by Henry VIII. See UNIVERSITY.

REGLA, rā'glà. A suburb of the city of Havana, Cuba, situated on the east shore of Havana harbor (Map: Cuba, C 3). It is connected with the city by ferry and with Guanabacoa, 3 miles to the east, by a street railroad. It is also the terminus of a railroad to Matanzas, has sugar warehouses, foundries, and shipyards, and receives a considerable part of the shipping of the harbor.

REGNARD, re-nyär', JEAN FRANÇOIS (1655–1709). A French dramatist, born in Paris, Feb. 7, 1655. In 1678 he was captured by corsairs on his way from Italy to France and held as a slave at Algiers. This event occasioned his novel *La Provençale*. Later he traveled very widely, from Scandinavia to Turkey, returning finally to France (1683), dividing the time between Paris and his estate at Grillon. He died Sept. 4, 1709. Regnard wrote several prose dramas (1688–93); then short plays in verse, and in 1696 produced his first great comedy, *Le joueur*, which with those that followed, *Le distrait* (1697), *Démocrite* (1700), *Les folies amoureuses* (1704), *Les Ménechmes* (1705), and *Le légataire universel* (1708), made him second only to Molière in contemporary esteem. He continued also to write dramas in prose, of which *La foire de Saint-Germain* is most noteworthy, and in *La suite de la foire* he combined prose and verse. He sought to combine the qualities of La Bruyère and Molière, but for this he lacked depth, strength, and seriousness. He shows to best advantage in plot, action, and dialogue, not in analysis and portrayal of character. Regnard's works were collected in five volumes in 1731 and in two volumes in 1854. Everything of primary importance is in the *Collection Didot* (Paris, 1820). The latest edition is by Moland (ib., 1875). Consult Marcel Compaignon de Marchéville, *Bibliographie et iconographie des œuvres de Jean François Regnard* (Paris, 1877), and R. Marenholtz, *Jean François Regnard: eine Lebenskizze* (Oppeln, 1887).

REGNAULT, re-nyô', HENRI (1843–71). A French figure and genre painter. He was born in Paris, Oct. 30, 1843. After a brilliant record in classical studies he entered the atelier of Lamothe and afterward that of Cabanel, won the Prix de Rome in 1866, and during the two years spent at Rome he designed, among other illustrations, those for Wey's *Rome*. Among his paintings executed at the same time were "The Lady in Red" and "Automedon Taming the Horses of Achilles" (Boston Museum of Fine Arts). In 1868 he went to Spain, and while at Madrid he devoted himself especially to the study of Velazquez, whose influence appears in his equestrian portrait of General Prim, one of the finest of the century. Refused by the sitter, it was taken by the artist to Paris, where it created a great sensation in the Salon of 1869, and is now hung in the Louvre. From the same year dates his charming portrait of the Countess de Barck (Louvre) and "Judith" (Marseilles Museum), and in 1870 he exhibited "Salome," a symphony in yellow, an incarnation of sensual cruelty. In that year he went to Morocco, whence he sent his famous symphony in red, the "Moorish Headman" (Louvre), a type of the dreamy cruelty of Oriental fatalism. But hearing of the disastrous opening of the Franco-German War, he hastened back to Paris and, enlisting in a regiment, was killed at the sortie of Buzenval, Jan. 19, 1871. In the following year the pupils of the Ecole des Beaux-Arts erected a monument to him in the chief court of that school. Regnault was the greatest of the followers of Delacroix (q.v.), whose worthy heir he was, both as regards temperament and technique. He resembled him in brushwork and in color, and his drawing is even surer. Consult: Henri Baillière, *Henri Regnault* (Paris, 1872); Henri Cazalis, *Henri Regnault: sa vie et son œuvre* (ib., 1872); Roger Marx, "Henri Regnault," in *Les artistes célèbres* (ib., 1886); Regnault's *Correspondance*, edited by Duparc (Paris, 1904).

REGNAULT, HENRI VICTOR (1810–78). A French chemist and physicist, born July 21, 1810, at Aix-la-Chapelle, Germany. As a boy he went to Paris and found employment in a drapery establishment. In this manner he was able to provide for himself and his sister while devoting his leisure hours to study. In 1830 he was admitted to the Ecole Polytechnique, and two years later, on completing his course of study, entered on the practice of mining engineering. After filling for some time the chair of chemistry at Lyons, he was elected a member of the Academy of Sciences, and in 1840 he became professor of chemistry at the Ecole Polytechnique. In the following year he succeeded Dulong as professor of physics at the Collège de France. In 1847 he was made chief engineer of mines and in 1854 director of the porcelain manufactory at Sèvres. He died at Auteuil, Jan. 19, 1878.

Regnault devoted himself especially to the careful measurement of the constants of nature, laying the foundation on which important chapters in theoretical and physical chemistry have since been built by other investigators. His greatest work is that on the numerical data bearing on the working of steam engines, for which the Royal Society of London awarded him their Rumford medal. This work forms volume xxi of the *Mémoires* of the Academy of Sciences. He measured with great care the specific heats of various substances, and his determinations showed that the specific heat of solid chemical compounds is very nearly equal to the sum of the products of the specific heats and the numbers of atoms of the ingredient elements. He similarly showed that the specific heat of a solid alloy can be calculated directly from the specific heats of the component metals. He determined precisely the values of the vapor pressure of water corresponding to various temperatures and measured the vapor pressures of mixtures such as those of sulphuric acid and water. He determined the densities of the so-called permanent gases and investigated the true relations between the pressure and volume of gases. Regnault showed that the law of Boyle and Mariotte is only approximately correct. Regnault's data have led to important developments in the kinetic theory of gases and to more correct views concerning the relations between the gaseous and liquid states of aggregation. Among his contributions to organic chemistry the discovery of a number of interesting compounds, including carbon tetrachloride and derivatives of the unsaturated hydrocarbons, deserves mention. He published his observations in the *Annales de Chimie et de Physique* and the *Comptes Rendus* of the Academy of Sciences. He also wrote *Cours élémentaire de chimie* (1849–50 and several later editions) and an abridgment of this work, entitled *Premiers éléments de chimie* (1850; 6th ed., 1874). A collection in three volumes of most of his papers on gases and vapors appeared under the title *Relation des expériences entreprises pour déterminer les lois et les données physiques nécessaires au calcul des machines à feu* (1847–70). Consult Dumas, *Eloge historique de Henri Victor Regnault* (Paris, 1881).

REGNAULT, JEAN BAPTISTE, BARON (1754–1829). A French historical painter, of the clas-

sical school. He was born in Paris and studied under Bardin, or, according to other authorities, under Vien; took the Prix de Rome in 1776; and was elected to the Academy in 1783 and to the Institute in 1795. His works are in the cold correct style of the period, but are happy in arrangement and occasionally, as in his masterpiece, the "Education of Achilles," show considerable spirit. Among his other canvases are the "Baptism of Christ," in the Louvre, and historical paintings at Versailles. As a teacher Regnault was the chief rival of David.

REGNIER, re-nyâ', CLAUDE AMBROISE, DUKE DE MASSA (1736–1814). A French statesman, born at Blamont, Meurthe-et-Moselle. An advocate by profession, he was a deputy to the States-General (1789) and took a prominent part in establishing the Republican judiciary, but retired during the Reign of Terror. In 1795 he was elected to the Council of the Ancients. He became president of that body in 1798, shared in the coup d'état of the following year, and, as Councilor of State under Bonaparte, was intrusted with the revision of the civil code He was Minister of Police in 1802–04 and Minister of Justice from 1802 to 1813, when he was made Président of the Legislative Assembly. He was created Duke in 1809.

RÉGNIER, râ'nyâ', HENRI DE (1864–). A French author, born Dec. 28, 1864, in Honfleur (Calvados) and educated in Paris. The series of sonnets, entitled *Sites* (1887), which first brought the poet to public notice, were essentially classic and correct. A new manner, new metres, and the sparing use of the *vers libre* in the volumes which immediately followed marked him as a leader among the Symbolists and a pupil of Mallarmé and Verlaine In this period mention should be made of *Episodes* (1888), less personal or analytical than any preceding volume and but little more than a series of voluptuously beautiful pictures; of *Poèmes anciens et romanesques* (1890), in which symbolic meaning is given to many old stories; of *Tel qu'en songe* (1892), with its mystic and reflective fancy of double personality; and of *Aréthuse* (1895), his most finished work, an admixture of Hellenic myth and beauty with Celtic melancholy. *La corbeille des heures* reverts to the theme of the earlier poems with an added beauty of treatment, and in *Médailles d'argile* (1900) the poet returns to his earlier exactness of metre. In his fiction —*La canne de jaspe* (1895), *Le trèfle blanc* (1899), *La double maîtresse* (1900), *Les vacances d'un jeune homme sage* (1903), *Rencontres de Monsieur de Bréat* (1904), *Le passé vivant* (1905), *La peur de l'amour* (1907), *Le mariage de minuit* (1910), *La canne de jaspe* (1912), and *L'Amphisbène* (1912)—Régnier shows the same fondness for the unreal and the mediæval, and the same command of melodious diction as in his verse. To an unusual degree Régnier's work embodies the spirit and style of the libertine story-tellers of the eighteenth century. In 1896 he married Marie, second daughter of Jose-Maria de Heredia (q.v.). He lectured before college audiences in the United States in 1900, in 1910 was made an officer of the Legion of Honor, and in 1911 was elected to the French Academy. Consult Amy Lowell, *Six French Poets* (New York, 1915).

RÉGNIER, MATHURIN (1573–1613). A French satirist, the nephew of Philippe Desportes (q.v.). He was born at Chartres, took orders as a youth, and went in 1593 as secretary with the Cardinal de Joyeuse to Rome. He returned in 1604, and in 1609 was made a canon in the Chartres Cathedral. He died in the prime of his talent, as the result of his excesses. His 16 satires include: *Le goût décide de tout; L'honneur l'ennemi de la vie; L'Amour qu'on ne peut dompter; Régnier apologiste de lui-même: La folie est générale; Le mauvais lieu.* The ninth attacks Malherbe. Dowden says: "His satires are those of a painter whose eye is on his object and who handles his brush with a vigorous discretion; they are criticisms of society and its types of folly or of vice, full of force and color, yet general in their intention, for except at the poet who had affronted his uncle, le bon Régnier struck at no individual." The only work printed during the poet's lifetime was *Satires et autres poésies de Mathurin Régnier* (1608, 1613). The best editions of his work are those of Viollet-le-Duc (1853), Barthélemy (1862), and Courbet (1869, 1875). Consult Vianey, *Mathurin Régnier* (Paris, 1896).

REGRAT'ING. An old common-law offense, consisting of buying "corn and other victuals" and scheming to enhance the price artificially. The offense was early made a matter of statute in England, and probably is not recognized as a common-law offense in the United States The ancient crimes known as forestalling (q.v) and engrossing (q.v.) were quite similar in nature.

REG'ULA (Lat., rule). A band under a triglyph (q.v) in the Doric style. It has the shape of a narrow stripe of marble, and on the lower side has six guttæ (q v.). It seems to represent an original wooden cleat secured by nails.

REGULA FAL'SI (Lat., rule of the false). The Latin name for the method of false position (q.v.). This method was largely used in the Middle Ages in the solution of equations. For example, the simple equation $ax + b = 0$ was solved thus: if z_1 and z_2 are any two numbers and $az_1 + b = c_1$, $az_2 + b = c_2$, then $x = \frac{z_2c_1 - z_1c_2}{c_1 - c_2}$. The truth of the rule is easily seen, for the eliminant of the equations

$$\begin{aligned} ax + b + 0 &= 0, \\ az_1 + b - c_1 &= 0, \\ az_2 + b - c_2 &= 0, \end{aligned}$$

with respect to a and b, is

$$\begin{vmatrix} x & 1 & 0 \\ z_1 & 1 & -c_1 \\ z_2 & 1 & -c_2 \end{vmatrix} = 0,$$

which reduces at once to the form stated. Consult Matthiessen, *Grundzuge der antiken und modernen Algebra* (2d ed., Leipzig, 1896).

REGULAR ARMY AND NAVY UNION OF THE UNITED STATES OF AMERICA. A patriotic society founded in Washington, D. C., Nov. 4, 1897. It has for its principal objects to provide for comrades when sick or in need; to assist in the burial of its dead; to keep alive old friendships formed in the service; to suggest and encourage the enactment of necessary laws for the benefit of soldiers, sailors, or marines; and to keep before the people and the officials of the government the necessity and justice of giving employment in the government service to men honorably dis-

charged or retired who have rendered faithful military service to the government and who are trustworthy and competent. It admits to membership members of the regular army, navy, or marine corps of the United States, or those who have been honorably discharged or retired, if they have served five years in either branch of the service. Its insignia consists of a badge pendant from a ribbon, which is the national flag, with a clasp at the top formed of a spread eagle, while the badge itself consists of a cross with the emblems of the different branches of the service in the points, and in the centre a triangle, with the letters A, N, and M, signifying Army, Navy, and Marine, surrounded by the legend "Trinitas Protego, R. A. and N. U., U. S." It has a membership of upward of 10,000, divided among garrisons and subgarrisons in the United States and the Philippines.

REGULARITY, IN BOTANY. See IRREGULARITY.

REGULATED COMPANIES. Associations of merchants formed in early modern times to exploit monopolies of special branches of foreign trade. Each member of the company embarked his capital in the monopolized trade, managing his own business, but subject to the regulations of the company. These companies were formed on the model of the mediæval guild (q.v.). They made rules for admission to the company, decided how great a volume of business each member should transact, and sometimes fixed prices. The company as a body possessed property, as, e.g., factories, i.e., trading posts, in the country with which they traded; but there was no idea of making profits to be distributed to the company as a whole. Through their regulation active competition among members was obviated and coöperation against foreign competitors assured. Thus it became possible to carry on trade which an isolated trader would not have ventured upon.

The earliest regulated companies were those formed by the merchants of the Hanseatic League (q.v.) for trading in England. The plan was adopted by the English merchants who first engaged in foreign trade, the Merchants of the Staple and the Merchants Adventurers (q.v.). The regulated company was the form of organization of the Levant Company, incorporated in 1581 to carry on trade in the eastern Mediterranean; the Muscovy Company (1554), of merchants trading in Russia: the Eastland Company, incorporated under Elizabeth to carry on trade with the Baltic countries. The East India Company, as originally constituted, formed a transition from the regulated to the joint-stock company. In the last-named company individual members were not given a right to carry on trade on private account, but were required to trade through subcompanies under the control of the parent company.

This form of organization was in its time distinctly superior to unregulated private trading, but it proved inadequate for carrying on so hazardous and extensive a trade as that with the East Indies and was gradually supplanted by the joint-stock company. After 1612 the East India Company had abandoned the principle of the regulated company. The other companies mentioned continued to exist in their original form until the eighteenth century. In the seventeenth century they showed a tendency towards monopoly, excluding, through excessive entrance fees, traders who desired to gain membership. Hence arose a class of interlopers, who traded in the monopolized region in defiance of the company. The minute regulations imposed upon members proved to be vexatious in the more enterprising trade of the seventeenth century, and were in large measure responsible for the decline of the companies.

REGULATION. See BIOLOGY.

REGULATORS, THE. The name given to those who actively opposed excessive taxes, dishonest sheriffs, and extortionate fees, in what were then called the back counties of North Carolina, in 1767–71. Practically all authority was at this time centred in the royal Governor; the taxes were levied exclusively upon the poll; there was little money in the western counties and no market for the products of these counties. The court officials, moreover, were accused of exacting illegal fees. Disturbances in Mecklenburg and Granville counties in 1765 and in Orange County in 1766 were easily put down. The Regulation proper began in Orange County in the spring of 1768, the Regulators agreeing to pay no more taxes until they were satisfied that such taxes were according to law and to pay no more than the legal fees. The news that the Assembly had appropriated £15,000 to build a house for the Governor increased the dissatisfaction. Minor disturbances occurred in the county, and the county militia was ordered out. William Butler and two other Regulators were fined and imprisoned. Edward Fanning, register of the county, was found guilty of extortion in office on five counts and was fined a penny and costs on each. The Assembly in 1769 was in sympathy with the Regulators. Petitions from Anson, Rowan, and Orange counties demanded among other things salaries for officers instead of fees, a property tax, and that ministers of any denomination should be allowed to perform the marriage ceremony. This Assembly was dissolved by the Governor, November 6, after a session of two weeks. In September, 1770, renewed disturbances occurred in Orange County. The Assembly thereupon expelled Herman Husband, one of the leaders of the Regulators, passed a Riot Act, voted £500 for the defense of the town, but proceeded to pass much legislation demanded by Regulators. In May, 1771, Governor Tryon (q.v.), at the head of a large force, proceeded to Hillsboro. On May 16 he met about 2000 Regulators, of whom hardly half were armed, at Alamance Creek. A sharp contest ensued for two hours. Of the Loyalists 70 were killed and wounded, while 9 of the Regulators were killed, a "great number" wounded, and 15 taken prisoners, one of whom was hanged on the spot. Six of the prisoners were tried and executed. By July 4 more than 6000 men had taken the oath of allegiance, and the Regulator leaders were pardoned by the King before the Revolution. In 1772 it was estimated that 1500 had emigrated to the West, and the excitement was over. During the Revolution most of the Regulators adhered to the King. Consult Bassett, "The Regulators of North Carolina," in the *Report* of the American Historical Association for 1894 (Washington, 1895), and W. H. Hoyt, *The Mecklenburg Declaration of Independence* (New York, 1907).

REGULUS, MARCUS ATILIUS. A Roman general. He was consul for the first time in 267 B.C., and for his successes against the Sallentini obtained the honor of a triumph. Chosen

consul a second time (256 B.C.), he was sent along with his colleague, L. Manlius Vulso, at the head of a fleet of 330 ships (with a land army on board) against the Carthaginians, in the ninth year of the First Punic War, and, encountering the enemy's fleet off Heraclea Minor, totally defeated it. The Romans then landed near Clypea, where they established their headquarters and ravaged the surrounding Carthaginian territory with fire and sword. When Manlius was recalled to Rome with one-half of the land forces, Regulus was left to carry on the war with the remainder. For some time he was victorious in every encounter, but at last (255 B.C.) suffered a total defeat; 30,000 Romans were left dead on the field, about 2000 fled and took shelter in Clypea, and Regulus, with 500 more, was taken prisoner. Regulus remained in captivity for five years, but, when fresh reverses induced the Carthaginians to solicit peace, he was released on parole and sent to Rome in company with the Punic envoys. The rest of his history is a favorite Roman tale. According to this, Regulus at first refused to enter Rome, since he was no longer a citizen; after this conscientious scruple was overcome he declined to give his opinion in the Senate until he was commanded to do so; he then sought earnestly to dissuade the Senators from agreeing to any of the Carthaginian proposals, even to an exchange of prisoners, and, after he had succeeded, by his earnest appeals, in obtaining the rejection of the Carthaginian offers, he resisted all persuasions to break his parole, though conscious of the fate that awaited him, and, refusing even to see his family, returned with the ambassadors to Carthage, where the rulers put him to death with horrible tortures. The common story is that he was placed in a cask or chest stuck full of nails with the points projecting inward and rolled about till he expired; when the news of this event reached Rome, retaliations equally atrocious, it is said, were committed on two of the noblest Carthaginian prisoners. (See Cicero, *De Officiis*, iii, 26; Livy, *Epitome of Book XVIII;* Silius Italicus, *Punica*, vi, 299–550.) Since, however, this story is not mentioned by Polybius (c.200 B.C.), who details at great length the achievements of Regulus (i, 25–34), modern authorities incline to doubt it. Consult the article "Atilius, 6," in Friedrich Lübker, *Reallexikon der klassischen Altertums*, vol ii (8th ed., Leipzig, 1914).

REHAN, rē'ăn (originally CREHAN), ADA (1860–1916). An American actress. She was born in Limerick, Ireland, April 22, 1860, and was brought to the United States when about six years old. While still at school she appeared upon the stage, but she virtually began her career by a two years' engagement at Mrs. Drew's theatre, in Philadelphia, during 1873–75. Subsequently she was with John W. Albaugh's company, playing leading juvenile parts, often with well-known stars, in Baltimore, Albany, and elsewhere. When Augustin Daly opened his theatre in New York in 1879, she joined his company, with which she continued till his death. As leading woman in the company, and after 1894 as a recognized star, she played the heroines in a long series of successful comedies, for which Daly's management was noted. Both in the delicate art of high comedy and in more farcical characters she won for herself before 1890 a place in the front rank of American players. Her two greatest rôles were those of Rosalind in *As You Like It* and Katharine in *The Taming of the Shrew*, while her Viola and her Lady Teazle were also much admired. Among her parts in Mr. Daly's lighter productions were those of Valentine Osprey in *The Railroad of Love*, Peggy in *The Country Girl*, Kate Verity in *The Squire*, Nancy Brasher in *Nancy and Company*. She was Maid Marian in Tennyson's *Foresters* and Roxane in Daly's presentation of *Cyrano de Bergerac*. Miss Rehan had great success in Germany in 1886, as also in Paris; and in London in 1888 and on frequent subsequent visits her popularity became almost as great as in America. She retired from the stage in 1906 and made New York her residence. Consult: William Winter, *Ada Rehan: A Study* (limited ed., New York, 1891); id., *Shadows of the Stage* (ib., 1892); L. C. Strang, *Famous Actresses of the Day in America* (Boston, 1899); Norman Hapgood, *The Stage in America, 1897–1900* (New York, 1901); William Winter, *The Wallet of Time*, vol. ii (ib., 1913).

REHATSEK, rā'hăt-shĕk, EDUARD (1819–91). An Orientalist, born at Illach in Slavonia and educated in Budapest. He left for the United States in 1842, where he lived for four years, mostly in New Orleans. In 1847 he settled in Bombay, where he became professor of Latin and mathematics in Wilson College. About 1871 he became examiner in Latin, Arabic, and Persian to Bombay University, but in 1881 he resigned this post and spent the last decade of his life as a Hindu pundit. He contributed to the *Calcutta Review*, *Indian Antiquary*, *Journal of the Royal Asiatic Society* (Bombay Branch), and *Zeitschrift der deutschen morgenlandischen Gesellschaft*. His published works include a valuable catalogue of the Arabic, Persian, Turkish, and Hindustani manuscripts in the Mulla Firuz (1873); *Amusing Stories* (1870), *Fortune and Misfortune* (1871), both from the Persian; a study on the Persian and Arabic inscriptions in Guzerat in the *Archæological Survey of India* (1885); a version of Mirchond's *Universal History* (1893); and a translation of Mīr Khwānd's *Garden of Purity* (1891–94).

REHEARSAL, THE. A burlesque by George Villiers, Duke of Buckingham, produced in 1671, ridiculing D'Avenant, Dryden, Sir Robert Howard, and other writers of the heroic dramas of the Restoration.

REHN, rān, FRANK KNOX MORTON (1848–1914). An American marine painter. He was born in Philadelphia and studied at the Pennsylvania Academy. Although he also painted landscapes and portraits, he is best known for his marines, which possess solid technical qualities and delicacy of tone. Good examples are "The Close of a Summer Day," Buffalo Academy; "The Missing Vessel," Detroit Museum; "A Moonlight Sea—Cape Ann" (1912); "The Swirl of the Surf" (1913); "A Sunny Afternoon in the Gulf Stream" (1914). He was made a member of the National Academy of Design in 1908 and received gold medals at the competitive Prize Fund Exhibition (1885) and at the American Art Society, Philadelphia (1907).

RE'HOBO'AM (Gk. *Ῥοβοάμ, Rhoboam*, Heb. *Rĕhab'ām*, probably the (divine) kinsman is, or makes, wide). The son of King Solomon by his wife, Naamah, Princess of the royal house of

Ammon, and his successor, in early youth, to the throne of all Israel (c.953–937 B.C.). The hereditary jealousy of Israel towards Judah, aggravated by Solomon's tyrannical exactions, came to a head at once upon the son's accession. He proceeded to Shechem to receive the homage of Israel, and arrogantly rejected the demand of his subjects that he lessen their burdens (1 Kings xi. 43, xii. 15). The leadership of the discontented tribes by Jeroboam, who already in Solomon's reign had been exiled for conspiracy (1 Kings xi. 26–40) and who had returned upon the death of Solomon, indicates a well-defined plan of revolt. The temper of Israel is further shown by the murder of Adoram, the aged minister of public works. Rehoboam, taken unawares, had to flee to Jerusalem; he made a show of compulsion by force of arms, but Judah had no forces commensurate with those of the north, and hostilities were confined to border warfare; according to the narrative he was forbidden to prosecute the war by the prophet Shemaiah (1 Kings xii. 16–24). From this time the so-called Kingdom of Judah consisted only of the tribe of Judah and half of Benjamin, with remains of Dan and Simeon. During the reign of Rehoboam Palestine was invaded (c.949 B.C.) by Shishak, or Sheshonk, the founder of the twenty-second Egyptian dynasty The narrative relates his spoliation of Jerusalem, where the temple suffered heavily (1 Kings xiv. 25–28). (See SHISHAK.) Rehoboam reaped the fruits of his father's vainglorious policy, and personally doubtless deserves the biblical condemnation (1 Kings xiv. 21–24), while his wife, probably a descendant of Absalom, exerted a powerful and evil influence in the government. He was succeeded by his son Abijam (Abijah). See JEROBOAM I.

REHO'BOTH (Heb. pl. of *rĕchōb*, wide, particularly the plaza by a city gate, the market and forum of an Oriental town, hence a common place name). 1. The name of a well dug by Isaac (Gen. xxvi. 22). As it is associated with Beer-sheba, the identification with the name of Wadi el Ruheibe, 8 miles southwest of Beersheba, is plausible. Here Robinson discovered ruins of a large city. This city evidently belongs to the Byzantine period. Two inscriptions found here were published by the Dominicans in *Revue Biblique* (Paris, 1905). Twenty-one inscriptions discovered at Ruheibe were published by Schmidt and Charles. Those that are dated come from the end of the sixth century A.D The town possibly figures under the name of Rubuta in the Tell el Amarna letters (182, 183, 239). It was known to Josephus (*Ant.*, i, 18, 2) as Ρωβώθ, *Roōbōth*. In the Græco-Roman period its name seems to have been Robotha. It is mentioned in the *Notitia Dignitatum* and in the *Rescript of Beersheba*. Consult: Robinson, *Biblical Researches*, vol. i (Boston, 1841); Palmer, *Desert of the Exodus* (Cambridge, 1871). Schmidt and Charles, "Greek Inscriptions from the Negeb," in *American Journal of Archæology* (Boston, 1910). 2. Rehoboth by the river (properly river town), the home of an Edomite king (Gen. xxxvi. 37; 1 Chron. i. 48). As "the river" is par excellence the Euphrates, the place has been assigned to Mesopotamia; but it can only be located in Edom.

REICH, rīk, EMIL (1854–1910). A writer on political science, philosophy, and other subjects. He was born at Eperjes, Hungary, was educated at Prague, Budapest, and the University of Vienna, and traveled extensively, spending 5 years in the United States, 4 in France, and 13 in England, where he frequently lectured at Oxford, Cambridge, and London universities. His publications include: *Die bürgerliche Kunst und die besitzlosen Volksklassen* (2d ed., 1894); *Foundations of Modern Europe* (1904; 2d ed., 1908); *Success Among Nations* (1904); *Imperialism* (1905); *The Failure of the "Higher Criticism" of the Bible* (1905); *An Encyclopædia of Institutions, Persons, Events, etc., of Ancient History and Geography* (1906); *Plato as an Introduction to Modern Criticism of Life* (1906); *Success in Life* (1907); *Germany's Swelled Head* (1907; 2d ed., 1914; American ed. as *Germany's Madness*, 1914); *Woman through the Ages* (2 vols., 1908); *General History of Western Nations from 5000 B.C. to 1900 A.D.* (1908); *Handbook of Geography, Descriptive and Mathematical* (2 vols., 1908); *Nights with the Gods* (1909).

REICHA, rīk'a, ANTON (1770–1836). An Austrian musical theorist and composer, born at Prague. He was nephew and pupil of the musician Joseph Reicha. From 1794 to 1799 he was piano teacher in Hamburg, where he wrote an opera, *Obaldi, ou les Français en Egypte*, which he took to Paris for production. He was unsuccessful with this, but two symphonies obtained for him a reception as instrumental composer. He lived in Vienna from 1801 to 1808, where he became intimate with Beethoven and was on friendly terms with Haydn, Albrechtsberger, and Salieri. In 1808 he returned to Paris and brought out the operas *Cagliostro* (1810), *Natalie* (1816), and *Sapho* (1822). These were only fairly successful. His Italian opera, *Argina, regina di Granata*, had previously failed in Vienna. He gained, however, a high reputation as theorist teacher and instrumental composer. In 1818 he succeeded Méhul as professor of counterpoint and fugue at the Conservatory, was naturalized in 1829, and succeeded to Boieldieu's chair in the Académie in 1835. Among his works are many instrumental pieces, especially string quartets and quintets for wind instruments, and the treatises: *Etudes ou théories pour le pianoforte dirigées d'une manière nouvelle* (1800); *Traité de haute composition musicale* (1824–26); *L'Art du compositeur dramatique* (1833). He was not an inventor, but his theoretical works are of practical value even to-day.

REICHARDT, rīk'ärt, JOHANN FRIEDRICH (1752–1814). A German composer, conductor, and writer on music, born at Königsberg. He had good musical training and studied philosophy at Königsberg and Leipzig. In 1775, upon the death of Agricola, he obtained the position of kapellmeister at Berlin. During an extended leave of absence in London and Paris (1785–86) he brought out his Passion music (after Metastasio) in both cities. He was commissioned to write two operas, *Tamerlan* and *Panthée*, for the Grand Opéra; but the death of Frederick II made it necessary for him to return at once to Berlin and the operas were not produced. Under Frederick William II he was permitted to increase the orchestra and obtain new singers from Italy, but later was suspended for three years and finally dismissed in 1794 on account of his sympathy with the French Revolution. Upon the death of the King he returned to Berlin, but the French

occupation in 1806 drove him back to Königsberg. Jerome Bonaparte, however, forced him to return and appointed him kapellmeister at Cassel. He composed numerous German and Italian operas, incidental music to plays, and *Singspiele* which had considerable influence on the development of German opera. As a song composer he is perhaps the most important before Schubert. He set about 60 of Goethe's lyrics to music. He published: *Ueber die deutsche komische Oper: Briefe eines aufmerksamen Reisenden, die Musik betreffend* (1774–76); *Studien fur Tonkünstler und Musikfreunde* (1793); *Vertraute Briefe aus Paris* (1804–05); *Vertraute Briefe, geschrieben auf einer Reise nach Wien* (1810), all of which are of permanent value. Consult E. Lange, *Johann Friedrich Reichardt* (Halle, 1902), and W. Tauli, *J. F. Reichardt: sein Leben und seine Stellung in der Geschichte des deutschen Liedes* (Berlin, 1903).

REICHENAU, HERMANN VON. See HERMANN VON REICHENAU.

REICHENBACH, rī'ĸen-bäĸ. A town in Silesia, Prussia, 32 miles southwest of Breslau (Map: Germany, G 3). It has an old castle and a Realgymnasium. It manufactures cotton and woolen fabrics, wagons, and sausages. A convention was concluded here between Austria and Prussia in 1790 by which the two powers agreed to respect the integrity of Turkey and Poland respectively. Pop., 1910, 16,387.

REICHENBACH. A town in the Kingdom of Saxony, Germany, 56 miles by rail south of Leipzig (Map: Germany, E 3). It has a new town hall, a commercial school, and a Realschule. There are wool mills, dye works, and machine shops. Pop., 1900, 24,498; 1910, 29,685.

REICHENBACH, GEORG VON (1772–1826). A German mechanician and optician, born at Durlach in Baden. He attended the military school at Mannheim, traveled in England in 1791–93, was an officer in the Bavarian army, and after 1804 engaged in making various kinds of optical and astronomical instruments at Munich until 1821, when he was employed as an engineer by the Bavarian government. He was responsible for the general use of the transit circle in European observatories after 1819.

REICHENBACH, KARL, BARON VON (1788–1869). A German naturalist and technologist, born at Stuttgart. He was educated at the University of Tubingen. He established ironworks at Villingen and kilns for the production of charcoal at Hausach. His researches in connection with the manufacture of charcoal led him to study the products of destructive distillation of organic bodies in general, and he was the first to obtain creosote and paraffin. In 1821, in connection with Count Hugo zu Salm, he founded the ironworks at Blansko in Moravia, and took charge personally of their superintendence. His name is also connected with what he thought to be the discovery of a new force of nature, an account of which may be found under OD. His principal publications include: *Geologische Mitteilungen aus Mahren* (1834); *Physikalisch-physiologische Untersuchungen über die Dynamide des Magnetismus, der Electricität, etc., in ihren Beziehungen zur Lebenskraft* (1849; trans. into English). Consult A. R. von Schrötter, *Karl Freiherr von Reichenbach: eine Lebensskizze* (Vienna, 1869).

REICHENBERG, rī'ĸen-bĕrĸ. An important industrial town in the Crownland of Bohemia, Austria, situated on the Neisse, 52 miles northeast of Prague (Map: Austria, D 1). It is a well-built town with a number of interesting churches, including the Kreuzkirche, built at the end of the seventeenth century, a sixteenth-century palace belonging to the counts of Clam-Gallas, a new Rathaus, and a number of monuments. The educational institutions of the town comprise a technical school, a higher Gymnasium, a seminary for teachers, a textile school, a municipal theatre, an industrial museum, and the municipal gallery, containing the Liebig collection of modern German and French masters. The textile industry was introduced into the town as early as the beginning of the fifteenth century, and Reichenberg, together with a number of adjacent villages, produces now cloth, carpets, and various kinds of woolen and cotton goods on a very large scale. Reichenberg contains also the immense meat and malt extract works of Liebig & Co. Pop., 1900, 34,204; 1910, 36,350.

REICHENBERG, SUZANNE ANGÉLIQUE CHARLOTTE (1853–). A French actress, born in Paris. She was educated at the Conservatoire of Paris, and in 1868 made her début as Agnes in the *Ecole des Femmes* at the Comédie Française, of which she became a *sociétaire* in 1872. She retired from the stage in 1898, when she was married to Baron Pierre de Bourgoing. Her most popular rôles included Rosette in *On ne badine pas avec l'amour* and Marthe in *La souris*. She appeared also in *Monde ou l'on s'ennuie; Les ouvriers; Les Fourchambault; Les corbeaux; Denise; Francillon; Pépa; Les romanesques.*

REICHENHALL, rī'ĸen-häl. A town and watering place in the Kingdom of Bavaria, Germany, picturesquely situated amid lofty mountains, on the Saalach, 8½ miles southwest of Salzburg (Map: Germany, E 5). It is the centre of the Bavarian salt works (the largest in Germany). The saline baths, famous since the eighth century, are the most important in the German Alps. Pop., 1900, 4972; 1910, 6204.

REICHENSPERGER, rī'ĸen-spĕr'gĕr, AUGUST (1808–95). A German politician, born at Coblenz. He studied law at Bonn, Heidelberg, and Berlin, was a member of the federal Diet at Frankfort in 1848 and of the Erfurt Parliament in 1850, and became a counselor to the Cologne Court of Appeal in 1849. He served in the Prussian Second Chamber in 1850–63, in the Reichstag in 1867–84, and also in the Prussian Chamber of Deputies (Abgeordnetenhaus) after 1879. Of the Catholic group, which he had organized in 1852 and which became known as the Centre party, he was a leader for the rest of his life. His writings on art and architecture include: *Die christlich-germanische Baukunst* (1845; 3d ed., 1860); *Fingerzeige auf dem Gebiete der christlichen Kunst* (1854); *Vermischte Schriften über christlichen Kunst* (1856); *Georg Gottlob Ungewitter und sein Werken als Baumeister* (1866); *Augustus Pugin, der Neubegründer der christlichen Kunst in England* (1877).

REICHER, rīĸ'ĕr, EMANUEL (1849–). A German actor, born at Bochnia, Galicia. His early reputation was gained at the Josefstadt Theatre in Vienna, at the Royal in Munich, and at the Stadt in Hamburg. In Berlin he played at the Residenz Theatre, the Royal (1888–90), the Lessing (1892–94 and after

1902), and the Deutsches (1894–1901). In 1915–16, under the auspices of the Modern Stage and the American People's Theatre, both of which Reicher founded, he had a theatre in New York and presented a number of plays seldom staged. In some of these he himself and his daughter Hedwig had rôles. His son Frank also became known as an actor. Emanuel Reicher, who until 1915 had never played in English, came to be recognized internationally as one of the most distinguished German actors of his day, the leading interpreter of Ibsen, Björnson, Strindberg, and Hauptmann.

REICHERSBERG, rīK'ĕrs-bĕrK, GERHOH VON. See GERHOH or GERHOCH VON REICHERSBERG.

REICHMANN, rīK'mȧn, THEODOR (1849–1903). A German dramatic barytone, born at Rostock. He was educated musically under Elsler, Mantius, Ress, and Lamperti, and soon became famous for his voice, which was of a very dramatic quality. He sang in several important theatres of Germany and Austria, and from 1882 to 1889 he was a member of the Vienna court opera. One of his most famous achievements was his creation of the part of Amfortas at the Bayreuth Festival. In 1889–90 he sang at the Metropolitan Opera House in New York, after which he returned to Vienna.

REICHSRAT, rīKs'rȧt. 1. The national legislative assembly of the Austrian (Cisleithan) half of the Austro-Hungarian monarchy. See AUSTRIA-HUNGARY. 2 The Upper House of the Bavarian Parliament (Landtag). See BAVARIA.

REICHSTADT, rīK'stȧt, NAPOLÉON FRANÇOIS CHARLES JOSEPH BONAPARTE, DUKE OF (1811–32). The only child of Napoleon I and the Empress Maria Louisa. He is sometimes known as Napoleon II or as l'Aiglon (little eagle). The infant prince was proclaimed King of Rome and baptized in the cathedral of Notre Dame by Cardinal Fesch. After the battle of Waterloo Napoleon abdicated in favor of his son, but the Senate took no notice of Napoleon II and called Louis XVIII to occupy the French throne, whereupon Maria Louisa and her child removed to the palace of Schönbrunn, near Vienna, where they remained till the Treaty of Vienna had rearranged the affairs of Europe. Maria Louisa then proceeded to take possession of the Duchy of Parma, while her son continued to reside at the Austrian court with his grandfather, Francis I. By the Treaty of Paris (1818) it was decreed that Napoleon II should never inherit the domain of his mother. As a recompense he was created Duke of Reichstadt, with the rank of an Austrian prince, by an Imperial patent dated July 22, 1818. He died from an overindulgence in violent exercise and his body was interred in the Imperial tomb at Vienna. Consult Welschinger, *Le roi de Rome, 1811–32* (Paris, 1897), and Wertheimer, *The Duke of Reichstadt* (London, 1905).

REICHSTAG, rīKs'tȧg. See GERMANY.

REICK, rīk, WILLIAM CHARLES (1864–). An American journalist and newspaper owner. He was born in Philadelphia, where he entered newspaper work in 1883. He served as editor of the London and Paris editions of the New York *Herald* in 1888–89, was city editor of that newspaper from 1889 to 1903 and president of the New York Herald Company in 1903–06, and in 1907–12 was president of the Public Ledger Company of Philadelphia and part owner of the New York *Times*. In 1911 Reick became chief owner of the New York *Sun*.

REID, rēd, ALEXANDER PETER (1836–). A Canadian physician. Born in London, Ontario, he was educated there and in medicine at McGill, Edinburgh, and New York universities. He practiced his profession for a few years in Ontario, but after 1864 lived in Nova Scotia, chiefly at Halifax. He took part in founding Halifax Medical College and in procuring the improvement of the provincial laws in reference to the study and practice of medicine. In Halifax Medical College he was professor successively of physiology, the practice of medicine, hygiene, and medical jurisprudence, and for some years was president. In 1878–92 he was superintendent of the Nova Scotia Hospital for the Insane and in 1892 was appointed superintendent of the Victoria General Hospital, Halifax. Reid served as secretary of the Provincial Board of Health from 1893 to 1904, and in the latter year became chief health officer for Nova Scotia. For some years he was a member of the medical faculty of Dalhousie University. He contributed frequently to medical journals.

REID, CLEMENT (1853–). An English geologist, born in London and privately educated. For many years he was district geologist of the England and Wales Survey. He wrote on local geology—of the country around Cromer (1882), of Holderness (1885), of Newquay (1906), of Land's End (1907), etc.; *The Pliocene Deposits of Britain* (1890) and *The Island of Ictis* (1905); but is better known for his investigations of British paleobotany, particularly tertiary, writing *The Origin of the British Flora* (1899), *Submerged Forests* (1910), and, in collaboration with his wife, *Preglacial Flora of Britain* (1907), *Fossil Flora of Tegelen* (1907–10), *The Lignite of Bovey Tracey* (1910).

REID, DANIEL GRAY (1858–). An American capitalist. He was born at Richmond, Ind., where he became a bank clerk in 1874. In 1895 he was one of the organizers and became president of the American Tin Plate Company. Moving to New York in 1899, he shared in the organization of the National Steel Company, the American Steel Hoop Company, and the American Sheet Steel Company, and when the United States Steel Corporation was formed in 1901 became one of its directors and a member of its executive committee. Reid became a director also of the Rock Island lines, but in 1915 he resigned as chairman of the board of directors of the main road, the Chicago, Rock Island, and Pacific, after criticisms by stockholders of the methods in use and the resulting disclosures had necessitated a reorganization.

REID, SIR GEORGE (1841–1913). A Scottish portrait, flower, and landscape painter and illustrator. He was born in Aberdeen and studied at the Trustees Academy, Edinburgh, under Mollinger and Israels in Holland and Yvon in Paris. In 1891 he succeeded Douglass as president of the Royal Scottish Academy and was knighted. Reid was essentially a painter of men. His portraits are vigorously handled, vividly characterized, simple in design, and strong and solid in tone, but sometimes lack distinction and grace. Among his many eminent sitters were the Earl of Halsbury, Marquis of Tweeddale, Professor Tait (National Scottish Portrait Gallery), and the lord provosts Ure and Bilsland (Glasgow Gallery). He also painted charming flower pieces and pensively poetic

landscapes, silvery in tone and showing a fine appreciation of values, such as "St. Mary's Loch" and "Norham Castle." Finally his pen-and-ink drawings, especially his illustrations for Mrs. Oliphant's *Royal Edinburgh* and Smiles's *Thomas Edward*, place him in the foremost ranks of modern British graphic artists.

REID, GEORGE AGNEW (1860–). A Canadian genre, figure, and landscape painter, born near Wingham, Ontario. He studied at the Philadelphia Academy and in France, Spain, and Italy. His more important canvases include "Dreaming," "Mortgaging the Homestead," and "Champlain's Arrival at Quebec," all in the National Gallery, Ottawa. He also painted landscapes and gained success in panels for mural decoration. A series of these, "The Pioneers," in the entrance hall of the municipal buildings, Toronto, was presented to the city by Mr. Reid. His work is good in technique and color and shows an individual treatment of atmosphere. He was president of the Ontario Society of Artists in 1897–1901 and president of the Royal Canadian Academy in 1906–09.

REID, SIR GEORGE HOUSTOUN (1845–). An Australian political leader, born at Johnstone, Renfrewshire, Scotland. He became a barrister in New South Wales in 1879. In the following year he was elected to the colonial Legislative Assembly, where he continued to sit, with the exception of the year 1884–85, until 1901. After federation he represented East Sydney until 1909. From 1894 to 1899 he was Prime Minister and Colonial Treasurer of New South Wales. After the establishment of the Australian Commonwealth he became leader of the Free Trade party in the federal Parliament and was Premier from August, 1904, to July, 1905. In 1905–06 he conducted an active antisocialist campaign against the Labor party. In 1910–15 he served as High Commissioner for Australia. Reid was created K.C.M.G. in 1909, and was promoted G.C.B. in 1916.

REID, HARRY FIELDING (1859–). An American geologist, born in Baltimore and educated at the Pennsylvania Military Academy (C.E., 1876) and at Johns Hopkins (A.B., 1880; Ph.D., 1885). Between 1889 and 1896 he was a member of the faculties of the Case School of Applied Science at Cleveland, Ohio, and of the University of Chicago. At Johns Hopkins he was associate professor (1896–1901) and professor (1901–11) of geological physics, and thereafter professor of dynamical geology and geography. Reid was chief of the highway division of the Maryland Geological Survey from 1898 to 1905 and a member of the United States Geological Survey after 1902. Besides preparing special reports he wrote in collaboration *Highways of Maryland* (1899) and contributed to the NEW INTERNATIONAL ENCYCLOPÆDIA.

REID, JAMES SMITH (1846–). A British classical scholar, born at Sorn, Ayrshire, Scotland, and educated at Christ's College, Cambridge, of which he was fellow from 1870 to 1872 and classical lecturer from 1870 to 1880. He was also classical lecturer of Pembroke College (1873–78, 1880–85) and tutor of Gonville and Caius College (1885–98). In 1899 he became professor of ancient history at Cambridge. Reid edited Cicero's works (the *Cato Maior, Lælius, Pro Balbo,* and especially the *Academica*, a valuable work, 1885). He translated also the *Academica* of Cicero (1880) and the *De Finibus* of Cicero (1883), contributed chapters on Roman history and Roman law to J. E. Sandys's *A companion to Latin Studies* (1910; 2d ed., 1913), and to the *Cambridge Mediæval History*, vols. i–ii (1911 et seq.), and published an elaborate work, *The Municipalities of the Roman Empire* (1913).

REID, (THOMAS) MAYNE (1818–83). A British writer of hunting romances and tales of adventure, born at Ballyroney, County Down, Ireland, April 4, 1818. His father was a Presbyterian minister and Mayne Reid was educated for the same profession, but the thirst of adventure led him to emigrate to the United States. In 1840 he arrived at New Orleans, where he worked as a storekeeper, negro overseer, and actor. As a hunter and trader among the Indians he gained that knowledge of scenery, manners, and characteristics which he afterward used to advantage in his *Scalp Hunters* (1851), *White Chief* (1859), and many other romances. He devoted five years to travel in the United States. In 1846 he obtained a commission and served with distinction in the Mexican War. In 1849 Reid sailed for Europe to take part in the struggle for independence in Hungary, but arrived on the Continent too late. It was in England that he began his long series of romances. In 1867 he returned to New York and founded the unsuccessful *Onward Magazine*, but from 1870 till his death, Oct. 22, 1883, he again lived in England. Among his many tales of adventure on land and on sea, for which his own extraordinarily adventurous life furnished abundant material, are: *The Rifle Rangers* (1850); *The Desert Home* (1851); *The War Trail* (1857); *The Boy Tar* (1859); *Afloat in the Forest* (1865); *The Castaways* (1870); *Free Lances* (1881). Most of Reid's stories were translated into French and many of them into German. Consult the *Memoir* by his widow, Elizabeth Reid (London, 1890).

REID, OGDEN MILLS (1882–). An American newspaper owner and editor, son of Whitelaw Reid and grandson of Darius Ogden Mills (qq.v.). He was born in New York City and received his education in Bonn, Germany, and at Yale (A.B., 1904; LL.B., 1907). In 1908 he was admitted to the New York bar, but instead of practicing law he joined the staff of the New York *Tribune*, on which he afterward held a variety of positions, becoming managing editor in 1912 and editor in 1913, in succession to his father. As owner of the *Tribune* (president of the Tribune Association) Ogden Reid was successful in procuring the services of some of the most able editorial, news, and special writers in New York.

REID, ROBERT (1862–). An American figure and decorative painter, born in Stockbridge, Mass. He studied at the Boston Museum School, the Art Students' League, New York, and under Boulanger and Lefebvre, in Paris. His work as a decorator began with a commission for the Liberal Arts Building at the World's Fair, Chicago (1892). This was followed by decorations in the Massachusetts State House, Boston; Library of Congress, Washington; Appellate Court, New York; Paulist Church, New York; and 20 stained-glass windows for the Rogers Memorial Church, Fairhaven, Mass. His easel subjects, which may be seen in many public galleries in America, are usually slender,

graceful girls, surrounded by flowers, such as "Fleur-de-Lis," Metropolitan Museum, New York. He also painted interiors and landscapes. His art is essentially lyric and decorative, and he cares more for color and effects of light than for modeling and form. He received the Hallgarten (1898) and Clarke (1909) prizes of the Academy, a special gold medal for mural decoration at the Paris Exposition of 1900, and a gold medal at the Panama-Pacific Exposition, San Francisco, in 1915. In 1906 he became a member of the National Academy of Design.

REID, SIR ROBERT GILLESPIE (1840–1908). A Canadian railway contractor, born at Coupar Angus, Perthshire, Scotland. In 1865 he went to Australia, where he was interested in gold mining and other ventures, and in 1871 he emigrated to America, had charge of the construction of a large section of the Canadian Pacific Railway, of the international bridge across the Niagara River, the international railway bridge over the Rio Grande, the Lachine Bridge over the St. Lawrence, ¾ mile in length, and of much other important bridge work in the West. In 1893 he contracted with the government of Newfoundland to construct in three years a transinsular railway from St. John's to Port-aux-Basques, to be paid for at the rate of $15,600 a mile, and to operate the line for 10 years in return for alternate, 5000-acre blocks of land along the railway, one for each mile built. In 1898 Reid contracted to operate all the Newfoundland railways for 50 years on condition of receiving a land grant of 2,500,000 acres, the government telegraph lines, and the ownership of the railways at the expiry of the 50 years. Reid's contract attracted wide public attention, and the Newfoundland Governor, fearing popular discontent, refused to ratify it. Sir James Winter, the Conservative Premier, was defeated on account of this support of Reid, and Sir Robert Bond, who succeeded him, procured a modified contract which transferred the Reid property to a company, safeguarded private rights, and provided for the restoration of the railways to the colony after 50 years, under equitable conditions. Reid was knighted in 1907.

REID, ROBERT THRESHIE, first EARL LOREBURN (1846–). A British politician and jurist, born at Dumfries, Scotland. He studied at Oxford, was called to the bar in 1871, and in 1880 entered Parliament from Hereford. From 1886 to 1905 he sat as a Liberal for Dumfries. He served as Solicitor-General in 1894, Attorney-General in 1894–95, and was one of the British counsel before the Venezuelan Boundary Commission. From 1905 to 1912 Reid held the post of Lord Chancellor. He was knighted in 1894, was created G.C.M.G. in 1899, became first Baron Loreburn in 1906, and first Earl Loreburn in 1911. He is author of *Capture at Sea* (1913). Consult A. G. Gardiner, *Prophets, Priests, and Kings* (London, 1908; new ed., Wayfarer's Library, ib., 1914).

REID, SAMUEL CHESTER (1783–1861). An American privateersman, born in Norwich, Conn. He went to sea at the age of 11, and on his first voyage was captured by a French frigate and confined for six months in Guadaloupe. Subsequently he entered the United States navy and served on the *Baltimore* under Commodore Thomas Truxtun in the West Indies. During the War of 1812 he commanded the privateer *General Armstrong*. On Sept. 26–27, 1814, in the neutral harbor of Fayal, Azores, the *General Armstrong* was attacked by three British vessels of superior strength. Reid inflicted a loss of 120 killed and 180 wounded on the enemy and retreated to the shore. The entire American loss was 2 killed and 7 wounded. The question of violation of the neutrality of Fayal was decided against the American contention. Subsequently, however, the British government apologized for the breach of neutrality. Reid was for many years warden of the port of New York. He invented and built the signal telegraph at the Battery and the Narrows, planned the United States flag, adopted in 1818, providing for 13 permanent stripes and for stars increasing with the admission of new States.

REID, THOMAS (1710–96). A leading philosopher of the Scottish school. He was born April 26, 1710, at Strachan, Kincardineshire, began his education in the parish school of Kincardine, and at the age of 12 became a student at Marischal College in Aberdeen. He took his degree of M.A. in 1726, and continued to reside in Aberdeen as college librarian. In 1737 he was presented by the senatus of King's College to the parish church of New Machar in Aberdeenshire. He had fully adopted the idealism of Berkeley, but was revolted by the conclusions drawn from it by Hume, and in consequence was led to seek a new foundation for the common notions as to a material world. In 1752 he was appointed one of the professors of philosophy in King's College, Aberdeen. Here he taught mathematics, natural philosophy, and moral philosophy. In 1763 he was chosen to succeed Adam Smith as professor of moral philosophy in the University of Glasgow. He now confined himself to teaching metaphysics and psychology. In 1764 he published his *Inquiry into the Human Mind on the Principles of Common Sense*. He continued in the duties of his chair till 1781, when he devoted his remaining strength to the publication of his works on the mind. In 1785 the *Essays on the Intellectual Powers* appeared, and in 1788 *Essays on the Active Powers*. The distinguishing feature of his philosophy was the assertion of certain irresistible convictions which are due to intuitions. Among them are the conviction as to the real existence of an external world, as to the causal connection of phenomena, as to the moral character of actions and the existence of the soul. Reid's works were edited with a *Life* by Dugald Stewart (Edinburgh, 1804) and by Sir William Hamilton (8th ed., ib., 1880). Consult: James McCosh, *Scottish Philosophy from Hutcheson to Hamilton* (New York, 1875); Andrew Seth, *Scottish Philosophy* (2d ed., Edinburgh, 1890); E. H. Sneath (ed.), *The Philosophy of Reid* (New York, 1892); A. C. Fraser, *Thomas Reid* (Edinburgh, 1898). See COMMON SENSE.

REID, SIR (THOMAS) WEMYSS (1842–1905). An English journalist and author, born at Newcastle-on-Tyne and educated there. Having entered journalism in 1861, he edited the Leeds *Mercury* for 17 years. In 1887 he resigned to become manager of Cassell & Co., publishers, a position he held for the rest of his life. From 1890 to 1899 he edited the *Speaker*. In 1894 he was knighted. He wrote, notably: *Cabinet Portraits* (1872); *Charlotte Brontë* (1877); *Politicians of To-Day* (1879); *The Land of the*

Bey (1882); *Life of W. E. Forster* (2 vols., 1888); *Life of Richard Monckton Milnes* (1890); *Life of Lord Playfair* (1899); *Life of William Black* (1902). He also edited a two-volume *Life of Gladstone* (1899). Two successful novels came from his pen—*Gladys Fane* (1884) and *Maulverer's Millions* (1886). Consult his *Memoirs, 1842–1885* (New York, 1905), edited by his brother, Dr. Stuart Reid.

REID, WHITELAW (1837–1912). An American journalist, diplomat, and writer. He was born at Xenia, Ohio, Oct. 27, 1837, graduated at Miami University (1856), and immediately entered journalism and local politics. For a time he edited the Xenia *News*. He was a captain and volunteer aid on the staff of Maj. Gen. Thomas A. Morris and afterward on that of Rosecrans (1861). He served as correspondent of the Cincinnati *Gazette* during the Civil War, and was afterward chosen librarian of the House of Representatives (1863–66). He then experimented with cotton planting in Louisiana, at which time he wrote *After the War* (1866). After his return to Ohio he published *Ohio in the War* (1868). He next joined the staff of the New York *Tribune* and, succeeding Horace Greeley in 1872, became its editor and principal owner. His successor in control of the *Tribune* was his son, Ogden Reid (q.v.). In 1881 Mr. Reid married a daughter of the financier, Darius Ogden Mills. He twice declined appointment as Minister to Germany, but he accepted the nomination for Vice President (1892) and the appointments of Minister to France (1889–92) and Special Ambassador to Queen Victoria's Jubilee (1897). He was also a member of the Peace Commission that terminated the Spanish War (1898) and Special Ambassador to Great Britain for the coronation of Edward VII (1902). Elected a life member, in 1878, of the New York State Board of Regents, he became vice chancellor (1902) and chancellor (1904) of the University of the State of New York. In 1905 President Roosevelt appointed him American Ambassador to Great Britain, where he was much appreciated, not only as a diplomat, but as a speaker, both at dinners and before learned societies. Though his personal tastes were simple, he lavished his wealth in splendid entertainments at the American Embassy and became a popular and conspicuous figure in the social life of London. Mr. Reid was honored with degrees by several universities at home and abroad. He died in London, Dec. 15, 1912. Among his writings are: *Schools of Journalism* (1871); *The Scholar in Politics* (1873); *Some Newspaper Tendencies* (1879); *Town Hall Suggestions* (1881); *Our New Duties* (1899); *A Continental Union* (1900); *The Monroe Doctrine* (1903); *The Greatest Fact in Modern History* (1906); *How America Faced its Educational Problem* (1906); *The Scot in America* (1912); *American and English Studies* (2 vols., 1913).

REID, SIR WILLIAM (1791–1858). A British soldier, administrator, and meteorologist, born at Kinglassie, Fifeshire. He was educated at the Royal Military Academy, Woolwich, was commissioned lieutenant of engineers in 1809, and in 1810 joined Wellington's army at Lisbon. In 1815 he participated in Sir Edward Pakenham's unsuccessful attack on New Orleans and in 1835 commanded a brigade in the British Legion raised by the Queen Regent of Spain. Subsequently Reid served as Governor of the Bermudas (1839–46), of the Windward Islands, (1846–48), and of Malta (1851–58). He was knighted in 1851 and promoted to major general five years later. He published *An Attempt to Develop the Law of Storms by Means of Facts* (1838; 3d ed., 1850) and *The Progress of the Development of the Law of Storms and of the Variable Winds* (1849).

REIDSVILLE. A city in Rockingham Co., N. C., 24 miles southwest of Danville, Va., on the Southern Railway (Map: North Carolina, C 1). Located in the heart of the old tobacco belt, the city receives and manufactures tobacco goods of excellent quality. There is also a large cotton mill. The town, first settled about 1860, was incorporated in 1873. Pop., 1900, 3262; 1910, 4828.

REIFFERSCHEID, rī'fĕr-shīt, AUGUST (1835–87). A German classical scholar, born and educated in Bonn. He received a traveling fellowship in archæology from the University of Bonn; spent 1861–66 mostly in Italy, being part of the time charged by the Vienna Academy to make researches for the *Corpus Scriptorum Ecclesiasticorum Latinorum;* and was professor at Breslau (1868–85) and from 1885 at Strassburg. His works include: *Suetoni præter Cæsarum Libros Reliquiæ* (1860), the standard edition of these fragments; *Bibliotheca Patrum Latinorum Italica* (1865–72); *Arnobius* (1875); an edition of Anna Comnena's *Alexiad* (1878); and a partial edition of Tertullian (edited by Wissowa, 1890).

REIGATE, rī'get. A municipal borough and market town in Surrey, England, at the base of the North Downs, 23 miles south of London (Map: England, F 5). From early times it was considered a place of strength; and after the Conquest it was granted to the earls of Warrenne. The parish church is in various styles of architecture, the oldest portions dating from the twelfth century. Trade is chiefly agricultural. Near by are quarries of freestone and hearthstone and supplies of fuller's earth and of silver sand for manufacturing glass. Pop., 1901, 25,993; 1911, 28,502.

REIGHARD, rī'gärd, JACOB ELLSWORTH (1861–). An American zoologist, born at Laporte, Ind. He graduated at the University of Michigan in 1882 and then studied at Harvard and Freiburg. After serving as instructor and assistant professor in zoölogy at the University of Michigan, he was appointed professor of animal morphology in 1891, and after 1895 was professor of zoölogy and director of the zoölogical laboratory of the University. He was in charge of the Michigan Fish Commission in 1890–95, and from 1898 to 1901 was director of the biological survey of the Great Lakes under the United States Fish Commission. Besides numerous papers on fresh-water biology, behavior of fishes, etc., he published, in collaboration with H. S. Jennings, *The Anatomy of the Cat* (1901).

REIGN OF TERROR. That period of the French Revolution beginning with the fall of the Girondists (q.v.) in June, 1793, and terminating with the overthrow of Robespierre (q.v.), July 27, 1794. See FRENCH REVOLUTION.

REIMARUS, rī-mä'rŭs, HERMANN SAMUEL (1694–1768). A German naturalistic philosopher. He was born in Hamburg, Dec. 22, 1694, studied at the universities of Jena and Wittenberg, traveled afterward in Holland and England, and on his return was elected rector at the Gymnasium of Wismar (1723) and in 1728

professor of Hebrew and mathematics at the Gymnasium of Hamburg. He died there March 1, 1768. He is the author of the so-called *Wolfenbuttelsche Fragmente eines Unbekannten*, first published by Lessing in his *Beitrage zur Geschichte und Litteratur aus den Schatzen der Wolfenbüttelschen Bibliothek* (1774, 1777–78). These *Fragmente*, up to that time known only in manuscript by a few of Reimarus' most intimate friends, produced a sensation throughout Germany, since the author, in the boldest and most trenchant manner, denied the supernatural origin of Christianity. They were partially translated as *Fragments from Reimarus* (London, 1879). A cognate work is his *Vornehmste Wahrheiten der natürlichen Religion* (1754). His edition of Dio Cassius, partly from materials left by his father-in-law, J. A. Fabricius (q.v.), is one of the most valuable contributions to classical philology (1750). An English translation of a part of the *Fragments* was edited by C. Voysey (London, 1879). Consult: D. F. Strauss, *H. S. Reimarus und seine Schutzschrift für die vernunftigen Berehrer Gottes* (2d ed., Bonn, 1877); G. C. B. Punjer, *History of Christian Philosophy of Religion since Kant*, English translation by W. Hastie (New York, 1888); B. Brandl, *Die Ueberlieferung der "Schutzschrift" des H. S. Reimarus* (Pilsen, 1907).

REIMER, rī'mēr, JOSEF LUDWIG (1879–). An Austrian writer. He was born at Vienna and studied law at the universities of Vienna and Grenoble. Reimer traveled extensively in foreign countries. He is one of the three writers cited by Emil Reich (q.v.) as supporting his interpretation of Pan-Germanism. His writings include: *Ein pangermanisches Deutschland* (1905); *Grundzüge deutscher Wiedergeburt* (1906); *Kommt Hellas wieder?* (1912), a dramatic poem.

REIMS, rēms, *Fr. pron.* rāNS. A city of France. See RHEIMS.

REIN, rīn, JOHANN JUSTUS (1835–). A German geographer, born at Raunheim-on-the-Main and educated in mathematics and science at the University of Giessen. He made various scientific journeys in Europe, Asia, and America, and was professor of geography at the University of Marburg in 1876–83, and thereafter until his retirement in 1911 at Bonn. His publications include *Japan, nach Reisen und Studien* (1881–86), which was translated into English by the author himself under the title *Japan: Travels and Researches* (1884–89); *Columbus und seine vier Reisen nach Westen* (1892); *Beiträge zur Kenntniss der spanischen Sierra Nevada* (1899); *Abriss der Warenkunde* (1900).

REIN, WILHELM (1847–). A German educator and author, born at Eisenach. He studied at Heidelberg, Leipzig, and Jena, for several years was teacher at Weimar, and from 1876 to 1886 was principal of a school in Eisenach. In 1886 he was appointed professor of pedagogy at the University of Jena. Rein is an authoritative expounder of Herbartianism, especially as applied to elementary schools. He ranks among the foremost of educational theorists, and exerted great influence on the educational institutions of his country. His principal works are: *Theorie und Praxis des Volksschulunterrichts* (1879–93); *Pädagogik im Grundriss* (1892); *Grundriss der Ethik* (1906); *Encyklopädisches Handbuch der Pädagogik* (7 vols., 1895–99; 2d ed., 10 vols., 1902–10); *Pädagogik in systematischer Darstellung* (3 vols., 2d ed., 1911); *Das Kind* (2 vols., 2d ed., 1911). He edited Niemeyer's *Grundsatze der Erziehung* (1878–79) and founded the educational journal *Pädagogische Studien* in 1880.

REINACH, rī'nāk, JOSEPH (1856–). A French publicist, a brother of Salomon Reinach. He was born in Paris, Sept. 30, 1856, studied at the Lycée Condorcet and in the faculty of law of the University of Paris, and was admitted to the bar in 1877. Reinach wrote for the *Dix-neuvième Siècle* and for Gambetta's *République Française*, and in 1881–82 was private secretary to Gambetta, who was then president of the cabinet council. Having reëntered journalism, in 1886 he became proprietor with Deynarouse of the *République Française*, in which he supported the Union-Republican group. In 1889 he was elected, as a Liberal-Republican, deputy for Digne (Basses-Alpes), in 1893 was reelected, but in 1898 failed of reëlection because of his attitude in the Dreyfus case. It was not until 1906 that he was again elected for Digne, after a hotly fought contest. In 1910 he was reelected. Reinach denounced the introduction of secret documents into the Dreyfus trial of 1894, the forgeries of Paty du Clam and Henry, and the complicity of the latter with Esterházy, and was associated with Scheurer-Kestner in the movement for revision. He published on the case several pamphlets (combined and republished in *Affaire Dreyfus*, 1898–99); also *Tout le crime* (1900), *Histoire de l'affaire Dreyfus* (6 vols., 1901–04), the great authority on the subject, and *Les nouvelles catilinaires* (1905). The brochure *Les enseignements de l'histoire* originally appeared in the *Siècle*, and caused Reinach to be expelled from his captaincy in the territorial army for "a gross offense against discipline" and to be deprived of the decoration of the Legion of Honor. Among his further publications are: *La Serbie et le Montenegro* (1876); *Voyage en Orient* (1879); *Le ministère Gambetta* (1884); *Etudes de littérature et d'histoire* (1888–89); *Les petites catilinaires* (1889); three series of collected articles against Boulanger; several essays and reports on the reorganization of the French artillery; *Mes comptes rendus* (1911); *La réforme électorale* (1912). He also edited *Discours et plaidoyers politiques* (11 vols., 1881–85) and *Dépêches, circulaires, décrets, proclamations, et discours* (1886), both by Gambetta.

REINACH, SALOMON (1858–). A French archæologist, brother of Joseph Reinach, born at Saint-Germain-en-Laye (Seine-et-Oise). He studied at the Lycée Fontanes and the Ecole Normale Supérieure, was appointed to the French Classical School of Athens (Ecole Française d'Athènes), and made interesting excavations and discoveries at Myrina, near Smyrna, and elsewhere (1880–82). In 1886 he became attaché in the Museum of National Antiquities at Saint-Germain-en-Laye (later curator), in 1890–92 was assistant professor of national archæology at the Ecole du Louvre (later professor), and in 1893 was appointed associate curator of the National Museums. He was elected to the Académie des Inscriptions et Belles-Lettres in 1896, and of this academy was president in 1906. He edited a careful text (1877) of St. Augustine's *De Civitate Dei*. His publications include: *Chronique d'Orient* (1885–91), cataloguing all discoveries made in Greece to that date; *La nécropole de Myrina* (1887), with Pottier; *Description raisonnée du musée de Saint-Germain*

(1890); *Les Celtes dans les vallés du Pô et du Danube* (1894); *Répertoire de la statuaire grecque et romaine* (5 vols., 1897–1910); *Guide illustré du musée national de Saint-Germain* (1899); *Story of Art throughout the Ages*, English translation by Simmonds (1904); *Répertoire des peintures* (1905–10); *Répertoire des reliefs* (3 vols., 1910–13); *Cultes, mythes, et religions* (4 vols., 1904–13). In all he published more than 60 volumes and 3000 articles, of which there is a printed catalogue (new ed., Paris, 1914). Reinach's general history of art, *Apollo*, was translated into English, Spanish, Italian, and Hungarian, and his history of religion, *Orpheus*, into English.

REINAUD, rā'nō', JOSEPH TOUSSAINT (1795–1867). A French Orientalist, born at Lambesc (Bouches-du-Rhône). He was a pupil of Sylvestre de Sacy, and was appointed curator of the Royal Library in 1834. He was also president and (after 1838) De Sacy's successor as professor of Arabic at the Ecole des Langues Orientales Vivantes (1838–67). In 1832 he became a member of the Academy of Inscriptions, and from 1847 to his death he was president of the Société Asiatique. Reinaud published: *Monuments arabes, persans, et turcs du cabinet de M. le duc de Blacas et d'autres cabinets* (1828), a work of great value, especially in the province of epigraphy; a version of Raymond Lully's *Livre de la loi au Sarrazin* (1831), with Michel; *Extraits des historiens arabes relatifs aux guerres des croisades* (1829); *Invasions des Sarrazins en France* (1836); the text and a French version of Abulfeda's geography (1840–48), with Slane; *Fragments arabes et persans inédits relatifs à l'Inde* (1845), with translation; *Du feu grégeois* (1845), with M. Favé; *Relation des voyages faits par les Arabes et les Persans dans l'Inde et Chine* (1846); *Relations politiques et commerciales de l'empire romain avec l'Asie orientale* (1863).

REIN'DEER' (Icel. *hreinn*, AS. *hrān*, reindeer, from Lapp *reino*, pasturage + *deer*, AS. *dēor*, Goth. *dius*, wild beast, animal, Ger. *Thier*, animal). An Arctic deer (*Rangifer tarandus*) which has long been domesticated and used as a draft animal and a beast of burden in Northern Europe. The wild race still exists in varying abundance almost everywhere from Northern Scandinavia to Eastern Siberia, wandering to the Arctic coast and throughout Spitzbergen, Nova Zembla, and the Phipps and Parry islands. They are not known much south of Lapland in the west, nor below the northern margin of the great forest region in Siberia, but in the Ural region they wander southward to the borders of Perm. Whether the caribou (q.v.) of Greenland and Canada are to be regarded as merely geographical races of the European form, thus considered as a circumpolar species, is a matter of opinion. European zoölogists generally have, in the past, considered that the differences between European and American examples are not sufficient to be deemed specific. Merriam and other recent American zoölogists think otherwise and set apart four species and a number of subspecies in the New World. Within historic times reindeer lived in the islands north of Scotland, but became extinct there before the twelfth century; they were much more recently numerous throughout Scandinavia. The habits of the American species are outlined under CARIBOU. Those of the plains and islands of subarctic Europe and Asia wander about the tundras and desolate treeless mountains, making periodical migrations from one feeding-ground to another. In early summer the Spitzbergen herds betake themselves to the grassy valleys of the interior, whence they return in the autumn to the coast to feed upon seaweed. The coming of the winter ice cuts off this resource, compelling them to go into the mountains, where they subsist upon the rock-lichens, which they uncover by shoveling away several feet of snow with their flat horns, or pawing it aside with their feet. The alternate thawing and freezing of spring, by forming a hard crust on the snow, interferes sadly with their welfare, and great numbers sometimes starve at this season. In Siberia, as in North America, migrations in scattered herds regularly take place from the barren coast plains southward to the less inclement region along the borders of the forest area, where food may be obtained. Not much is known of the breeding habits of the wild reindeer except that the fawns are born in the spring.

The reindeer has long been domesticated among the Laplanders and the tribes along the coast of Siberia, and used for drawing sledges and as a riding and burden animal, besides furnishing skins for tents, clothing and harness, flesh and milk for food, and horns and hoofs for various utilities. It has remarkable endurance, strength, and speed in drawing sledges, and without this animal much of Lapland and Siberia could not be permanently inhabited. These qualities led the government of the United States to endeavor to naturalize reindeer among the Eskimos of the north coast of Alaska, who were in danger of starving through the loss of food and uneconomical habits, as a consequence of excessive whaling and walrus-hunting by white men off that coast. The experiment was conducted under the direction of the Commissioner of Education and the personal care of the Rev. Sheldon Jackson. Agents procured a small herd of Siberian reindeer which, with Lapp attendants, were landed in Northern Alaska in 1889. The training of Alaskan attendants and drivers was begun, and more herds were annually imported. Up to 1898, 550 deer had been brought from Siberia, and the stock with its increase amounted to about 5000 in 1903. Several stations were established where the deer were bred, and where Eskimos were trained in their care and use. The history of the attempt is contained in Jackson's *Annual Reports* to the Department of the Interior, from 1890 onward. A bulletin states that in 1914 there were 47,266 reindeer in Alaska, distributed among 62 herds. Of these animals 30,532 are owned by natives. In fact, within a period of twenty years the reindeer industry has made the Eskimos of Alaska civilized and thrifty men. In the year 1915 the first roundup of reindeer was made near Nome. Calves were branded and herds divided and shifted to new pastures. One hundred animals were killed and their flesh shipped south for market use. It was estimated that two thousand carcasses would be available the next year, and this phase of the industry promises to be one of great importance.

The wild reindeer is much larger than the domesticated races. It is as large as the stag, but heavier and more clumsy in appearance. It has a dark coat in summer and a lighter one in winter, with a growth of long whitish hair under the neck, while the region about the short goat-like tail and the outlines of the hoofs are nearly white. It constitutes a genus (*Rangifer*), differ-

ing from that of ordinary deer in the important particular that both sexes have horns, although those of the bucks are larger. These antlers are peculiar in their long, slender, unequally branching beams, and especially in the fact that the brow-tines are greatly produced and palmated, and one is usually aborted to allow the other to push forward into a formidable weapon, overhanging the face.

During Pleistocene time the reindeer was more widely distributed over Europe than it is at the present day, for its fossil remains have been found as far as the Alps and the Pyrenees.

Seton, *Life Histories of Northern Animals* (New York, 1909); Stone and Cram, *American Animals* (new ed., ib., 1914); and books cited under DEER and CARIBOU.

REINDEER MOSS (*Cladonia rangiferina*). A lichen of great importance to inhabitants of the northernmost regions of the Northern Hemisphere, where it covers great areas and furnishes the chief winter food of the reindeer. It is found in almost all parts of the world, but is most abundant and luxuriant in arctic and subarctic regions, often occupying the ground in pine and spruce forests. When such forests are destroyed by fire it soon reappears. It is a variable plant, but always consists of a much-branched, erect, cylindrical, tubular thallus, and attains a height of two inches or more. Its importance was first brought into notice by Linnæus in his *Flora Lapponica*. It is sometimes used for human food. Its taste is pleasant, although attended with a slight pungency or acridity. It is generally boiled in reindeer milk. Its nutritious qualities depend chiefly on a form of starch, lichenin, which it contains. In northern Russia it is used in the manufacture of alcohol. See Plate of LICHENS and Colored Plate of MOSSES AND LICHENS with the article MUSCI.

REINECKE, rī'nĕk-*e*, KARL (1824–1910). A German composer and pianist, born at Altona. He studied with his father, Johann Peter Rudolph Reinecke, a musical composer and director. He was court pianist to Christian VIII at Copenhagen from 1846 to 1848. He became teacher at the Cologne Conservatory in 1851, and occupied at later times the positions of musical director at Barmen, academic musical director and conductor of the Singakademie at Breslau. From 1860 to 1895 he conducted the Gewandhaus Concerts at Leipzig, and at the same time was teacher at the Conservatory; this latter post he held until his retirement from all active work in 1902. He was notable as an enthusiastic interpreter of the works of Mozart. His compositions are both refined and classic throughout, but possess here and there a marked touch of the romantic. Among his works are: a grand opera, *König Manfred* (1867); the operetta, *Ein Abenteuer Handels* (1874); two comic operas, *Auf hohen Befehl* and *Der Gouverneur von Tours* (1886 and 1891 respectively); a number of orchestral overtures, several choral works with orchestra; much excellent chamber music; and piano pieces for two and four hands.

REINECKE FUCHS. See REYNARD THE FOX.

REINFORCED CONCRETE. See CONCRETE.

REINHARDT, rīn'härt, MAX (1873–). A German theatrical director, whose ideas and methods were influential both in Europe and in America. He was born at Baden, near Vienna. After leaving the Gymnasium he began life as a bank clerk, but was attracted to the stage, and in 1894 appeared at the Deutsches Theater in Berlin, of which subsequently he became director. He established a cabaret; then the Berlin Kleines Theater; then "Die Kammerspiele." Between 1902 and 1912 he produced, among other dramas, Oscar Wilde's *Salome*, G. B. Shaw's *Cæsar and Cleopatra*, Wedekind's *Erdgeist*, Goethe's *Faust*, parts I and II, several plays of Shakespeare, the *Œdipus Rex*, the fine Oriental pantomime *Sumurun* (seen in New York in 1912), and various spectacles or spectacular fantasies, notable among which was *The Miracle* (1912). Reinhardt's prime aim was to bring the spectator intimately into the action of the drama, and send him through a play side by side, as it were, with the actors. To this end he resorted to various devices, among them the "apron" stage (see THEATRE). Though Reinhardt's stage effects were often splendidly impressive, the first decorative law of his theatre was simplicity. The scenery, according to him, required large severe lines, and should be suggestive or symbolical rather than minutely realistic. For his effects he relied much on light and color, and especially on ingenious use of electric lighting. Consult: Paul Legband, *Das Deutsche Theater in Berlin* (Munich, 1910); Siegfried Jacobson, *Max Reinhardt* (Berlin, 1910); and Huntly Carter, *The Theatre of Max Reinhardt* (New York, 1914).

REINHART, rīn'härt, CHARLES STANLEY (1844–96). An American illustrator, and genre and landscape painter. He was born in Pittsburgh and studied in Paris, and at the Royal Academy, Munich (1868–1879). Upon his return to America he illustrated for various foreign and American magazines, and frequently exhibited works in oil, water-colors, and black-and-white at the National Academy. From 1881 to 1891 he resided in Paris, exhibiting regularly at the Salon. His oils and water-colors are mostly marine views, painted in sombre but delicate colors. Among the best known are: "The Old Life Boat" (1880); "Mussel Fisherwomen" (1886); "Washed Ashore" (1887), which won the gold medal (Philadelphia, 1888); and the "Rising Tide" (1888), purchased by the government at the Paris Exposition, 1889. His water-colors include "Gathering Wood" (1877), "At the Ferry" (1878), and the "Spanish Barber" (1884). Reinhart excelled especially in black-and-white sketches and illustrations, executed in a forceful and highly characteristic manner. Among his chief works in this medium are the "Reichstag Sketches," "A Little Swiss Sojourn," and "Americans Abroad," and illustrations for Warner's *Their Pilgrimage* and Lathrop's *Spanish Vistas*.

REINHART VON GRÜNINGEN, fŏn grụ'-nĭng-*en*. See GRÜNINGER, JOHANN.

REINHOLD, rīn'hōlt, CHRISTIAN ERNST (1793–1855). A German philosopher, son of Karl Leonhard Reinhold, born at Jena. He at first lectured on philosophy at the University

of Kiel, and afterward was appointed professor of logic and metaphysics at the University of Jena. His philosophical system resembles Kant's. He published: *Handbuch der allgemeinen Geschichte der Philosophie* (3 vols., 1828–29; 4th ed., 1854, under the title *Geschichte der Philosophie nach den Hauptmomenten ihrer Entwickelung*); *Theorie des menschlichen Erkenntnisvermögens und Metaphysik* (1832–34); *Lehrbuch der Geschichte der Philosophie* (1836; 3d ed., 1849), a work of much value; and *System der Metaphysik* (3d ed., 1854). Consult Apelt, *Ernst Reinhold und die kantsche Philosophie* (Leipzig, 1840).

REINHOLD, KARL LEONHARD (1758–1823). A German philosopher, born in Vienna. In 1772 he entered the Jesuit College of St. Anna, but upon the suppression of this Order in 1774 he joined the Barnabites, and was for some years an inmate of their College of Saint Michael. His religious zeal in the meantime had cooled considerably, and in 1783 he left the Order and went to Leipzig, where he devoted himself to philosophy. Afterwards he settled in Weimar. His contributions to the *Deutscher Merkur* attracted much attention, and in 1787 his *Briefe uber kantsche Philosophie* appeared in this periodical. His clear and eloquent exposition of Kant's doctrines, which at that time were being combated, resulted in his being appointed to a professorship of philosophy in Jena. In 1789 he published his chief work, *Versuch einer neuen Theorie des menschlichen Vorstellungsvermogens,* in which he attempts to broaden the teachings of Kant. He then for a time identified himself with Fichte's doctrines and even tried afterward in his *Paradoxien der neuesten Philosophie* (1799) to find a middle way between Fichte and Jacobi in order to satisfy his religious sentiments, but he deserted both and accepted the rational idealism of Bardili when the latter's *Logik* appeared in 1800. The reason for this change he gives us in his treatise *Wahrheit* (1820).

REINICKE, rī'nīk-*e*, RENÉ PAUL (1860–) A German painter and draftsman, born at Strenz-Naundorf, near Halle. He studied at Weimar under Struys, at Düsseldorf under Gebhardt, and at Munich under Piglhein, whom he accompanied to Palestine. Settled afterward in Munich, he found the true field for his talent in drawing sketches for the *Fliegende Blatter*, in which his masterly delineations from the social life of the upper classes in its various aspects soon became an eagerly looked-for specialty. A selection of his drawings was published in Munich (1890) under the title "Spiegelbilder aus dem Leben." His painting "Waiting Room in the Munich Railway Station" is in the National Gallery, Berlin, and he is also represented in many other German galleries. He was awarded a gold medal at Weimar in 1882 and at Berlin in 1897.

REINKENS, rīn'kēns, JOSEPH HUBERT (1821–96). The first Old Catholic Bishop. He was born at Burtscheid, near Aix-la-Chapelle, studied theology at Bonn, was ordained priest of the Roman Catholic church, and in 1853 was appointed associate professor and, in 1857, full professor of Church history at Breslau. In 1870 he united with Döllinger in the Old Catholic movement, was suspended by the Bishop of Breslau, and the students were forbidden to attend his lectures. In 1873 he was consecrated Bishop at Rotterdam by the Jansenist Bishop of Deventer. He soon took the oath of allegiance to the government, and was recognized by Prussia as a Catholic bishop, with his residence at Bonn, and remained there in this capacity till his death. He was largely instrumental in organizing the Old Catholic movement into a church. His publications include: *Hilarius von Poitiers* (1864); *Martin von Tours* (1866); *Revolution und Kirche* (1876); *Melchior von Diepenbrock* (1881); *Lessing über Toleranz* (1883). English translations have appeared of his *First Pastoral Letter and Speech on Bible Reading* (1874) and *Speeches on Christian Union and Old Catholic Prospects* (1874). Consult: W. Beyschlag, *Bischof D. Reinkens und die deutsche Alt-katholizmus* (Berlin, 1896), and J. M. Reinkens, *J. H. Reinkens: Ein Lebensbild* (Gotha, 1906). See OLD CATHOLICS.

REINMAR VON HAGENAU, rīn'mär fôn hä'ge-nou (?–c.1210). A German poet, one of the first of the minnesingers, usually called Reinmar the Old. From Hagenau he went to Vienna and there taught Walther von der Vogelweide (q.v.), with whom he may have made the Crusade of 1190. His poetry, artificial, sad, and "pale-hued," won him the title of the "Nightingale of Hagenau" from Gottfried von Strassburg, a panegyric from his pupil Walther, and from Uhland high praise for its sentiment and diction. His works are published in Lachmann and Haupt's *Des Minnesangs Frühling* (4th ed., 1884). Consult: Schmidt, *Reinmar von Hagenau* (Strassburg, 1874); Burdach, *Reinmar der Alte und Walther von der Vogelweide* (Leipzig, 1880).

REINSCH, rīnsh, PAUL SAMUEL (1869–). An American political scientist and diplomat. He was born in Milwaukee, Wis., of German-American parents. He graduated at the University of Wisconsin in 1892, at the law school of the same institution in 1894, and after being admitted to the bar practiced for some time in Milwaukee. Returning to the State University in 1895, he became an instructor and extension lecturer in history, pursuing graduate studies at the same time. In 1899 he was appointed assistant professor of political science, and in 1901 professor of political science. In 1913 he became United States Minister to China. Before and after that date he served as delegate to various international conferences His publications include: *The Common Law in the Early American Colonies* (1899); *World Politics at the End of the Nineteenth Century* (1900); *Colonial Government* (1902); *Colonial Administration* (1905); *American Legislatures and Legislative Methods* (1907); *Readings on American Federal Government* (1909); *Readings on American State Government* (1911); *Civil Government* (1909); *Intellectual and Political Currents in the Far East* (1911); *Public International Unions* (1911). He was a contributor to the NEW INTERNATIONAL ENCYCLOPÆDIA.

REIS, rīs, PHILIPP (1834–74). A German physicist, born at Gelnhausen. In 1858 he became a teacher in the Garnier Institute, near Homburg, and there, after two or three years of research, in 1860 he produced the first telephone. It transmitted musical tone and somewhat indistinctly, though, it is claimed, intelligibly, human speech. In 1885 a monument was erected to him in his native town. Consult Thomson's English version of the sketch by Schenk (London, 1883).

REISEBILDER, rī'ze-bil'dĕr (Ger., pictures of travel). A work by Heinrich Heine in four volumes (1826–31). Some of the poems inter-

spersed through the work were published later with others under the title of *Buch der Lieder*.

REIS EFFENDI, rīs ĕf-fĕn′dĭ (Turk., presiding official). A title formerly given to an officer of state in the Ottoman Empire. He was the Chancellor of the Empire and Minister of Foreign Affairs.

REISEN, rī′zen, ABRAHAM (1875–). A popular Yiddish poet and short-story writer, who was born in Russia but settled in the United States. He received the traditional Jewish orthodox education, but soon took up the study of general literature and devoted himself to writing, contributing to and editing a number of Yiddish periodicals in Europe and America. In 1901 the first collection of his verse, *Occasional Poems*, met with considerable success. This was followed by *Stories and Portraits*, equally well received. An incomplete edition of his works appeared in 1908–13 (4 vols., Warsaw and Cracow). Some of his writings have appeared in translation. Like most of his contemporaries among Yiddish writers, Reisen is a realist, his special sphere being the life of workingmen. Many of his lyrics have been set to music.

REISIG, rī′zĭk, CARL CHRISTIAN (1792–1829). A German classical scholar He served against Napoleon in 1813–15, then studied at the University of Jena and was professor at Halle (1820–29). He published a critical edition of the *Clouds of Aristophanes* (1820) and a full commentary on the *Œdipus Coloneus* of Sophocles (3 vols., 1820–23). His valuable lectures on Latin grammar were published, with supplements, by his pupil, Heinrich G. F. C. Haase (q.v.). In one division of this work, that dealing with semasiology, Reisig was a pioneer. Consult J. E. Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908)

REISINGER, rī′zĭng-ẽr, HUGO (1856–1914). A German-American merchant and art patron. He was born in Wiesbaden, where he was educated at the Royal Gymnasium. Coming to America, he devoted a fortune acquired during a successful mercantile career in New York to the furtherance of art, especially of painting in contemporary Germany and the United States, and to the interchange of artistic ideas between these two countries. The possessor of a large and valuable collection of modern paintings, especially of the German school, Reisinger organized and financed the exhibition of contemporary German art held in the Metropolitan Museum, New York, in 1909, and a similar exhibition of American art held at Berlin and at Munich. In recognition of these services he was made Commander of the Order of the Prussian Crown and of the Bavarian Order of St. Michael; and from Columbia University he received an honorary A.M. in 1910. He bequeathed his entire fortune to the furtherance of his favorite interests, which included the establishment of a chair in the history of art at Columbia University. His collection of paintings was dispersed by sale in 1915.

REISKE, rī′skĕ, JOHANN JAKOB (1716–74). A German philologist and Oriental scholar. He was born at Zörbig, Prussian Saxony, and was educated at the University of Leipzig, where he devoted much attention to the study of the Semitic languages, especially Arabic. In 1758, after living in abject indigence, he obtained the rectorship of the Nikolai Gymnasium, in Leipzig, and he retained the post till his death. From 1758 he devoted his attention chiefly to Greek literature, in which he became a recognized authority. His works, which are very numerous and are remarkable for their learning, include *Animadversiones in Græcos Auctores* (1757–66) and editions of Theocritus (1765–66); of the Greek orators (1770–75); of Maximus Tyrius (1774–75); of Dionysius of Halicarnassus (1774–77); of Plutarch, with notes and translations (12 vols., 1774–82); Dio Chrysostom (1784–98); and Libanius (1791–94). Reiske was also the first to call attention to the historical and æsthetic value of Arabic literature. His chief work in this field was his Latin translation of the *Annales Moslemici* of Abulfeda (1754; frequently reëdited). Some of these works and his correspondence with Moses Mendelssohn and Lessing were published after his death by his wife, Ernestine Christine Reiske (1735–98). Consult: Morus, *De Vita Reiskii* (Leipzig, 1777); J. J. Reiske, *Selbstbiographie* (ib., 1793); Haupt, *Opuscula* (ib., 1875–76); J. E. Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

REISNER, rēz′nẽr, GEORGE ANDREW (1867–). An Egyptologist, born at Indianapolis, Ind. In 1889 he graduated from Harvard and in 1891 and 1893 respectively received from that university the degrees of A.M. and Ph.D. During 1895–96 he was an assistant in the department of Egyptology in the Royal Museum, Berlin, then for a year was an instructor in Harvard University, and from 1897 to 1899 served as a member of the International Committee on the Catalogue of the Khedival Museum at Cairo. In 1905 he was appointed assistant professor of Egyptology at Harvard and in 1910 became curator of the Egyptian department in the Museum of Fine Arts, Boston. Intimately connected after 1905 with exploration and excavation in Egypt, Reisner is the author of *Sumerisch-babylonische Hymnen nach Thontafeln griechische Zeit* (1896); *Tempelurkunden aus Telloh* (1901); *Hearst Medical Papyrus* (1905); *The Early Dynastic Cemeteries of Nayu-ed-Der* (part i, 1907); *First Annual Report, Nubian Archæological Survey* (1910); *Models of Ships and Boats* (1913).

REISS, rīs, WILHELM (1838–1910). A German traveler and naturalist, born at Mannheim. He traveled in the Azores, Madeira, and Canary islands in 1858–60, in Greece in 1866, and with Stübel in 1868–76 explored South America. In particular he visited Ecuador, Colombia, Peru, and Bolivia, and he and Stübel were the first to ascend Mount Cotopaxi. The scientific results of this journey were of much value. Reiss was president of the Berlin Gesellschaft für Erdkunde and of the Anthropological Society. In addition to contributions to the publications of the Gesellschaft für Erdkunde and various scientific journals, he wrote: *Das Totenfeld von Ancon in Peru* (1880–86), with Stübel; *Geologische Studien in der Republik Colombia* (1892–99); *Das Hochgebirge der Republik Ecuador* (1892–1909).

REISSIGER, rīs′sĭg-ẽr, KARL GOTTLIEB (1798–1859). A German musician, born at Wittenberg. He studied under Schicht at the Thomasschule at Leipzig and dramatic composition under Winter at Munich. He taught at the Berlin Royal Institute, and in 1826 went to The Hague, where he organized a conservatory. This same year he succeeded Marschner as musical director of the German Opera at Dresden, and later

was appointed kapellmeister, as Weber's successor. He was a prolific composer in almost every field, but entirely lacked originality.

REITBOK. See REEDBUCK.

REITER, rī'tēr, VIRGINIA (?–). An Italian actress, born at Modena. After studying for the stage under Giovanni Emanuel she made her début at Milan in 1882. She first attracted general attention in *La Figlia di Jefte* in 1886. The next year she visited Mexico, Chile, Peru, and Havana; in 1891 she went again to South America and in 1892 toured Spain. In *Agatomédan* she appeared (1890) at the Teatro Nazionale, Rome. Virginia Reiter played leading rôles in *Othello, I Nozze di Figaro, La Dame aux Camélias,* and *Le Demi-Monde.* In 1893 she formed with Claudio Leigheb the Reiter-Leigheb Company, which presented *Zaza* and other plays. Consult Addison McLeod, *Plays and Players in Modern Italy* (London, 1912).

REJ, rā'y', MIKOLAJ (or NICHOLAS REY) (1505–69). A Polish poet and prose writer, born in the Ukraine. A stout Calvinist, he wrote much in defense of his chosen creed. Rej was one of the first to use Polish as a literary language. He was more than 60 years old before he produced his principal poem, *Zwierciadlo* (The Mirror, 1567; reprinted in 1829). Besides metrical Polish translations of the Psalms (1533), *Postylla Polska* (Gospel Commentaries, 1556), and a catechism, he published a biblical play, *Zywot Józefa* (1545) and several works of satirical and moralizing character. His prose shows the language in its purity before the introduction of foreign words and forms.

RÉJANE, rā'zhān', GABRIELLE (1857–). The stage name of Charlotte Réju, a French actress, born in Paris. She made her début at the Vaudeville in 1875, and soon gained a reputation for her witty impersonations. In 1892 she married M. Porel, then her manager. In 1893 she created her best-known part, the title rôle of *Madame Sans Gêne,* written for her by Sardou. She appeared with it in London in 1894 and in the United States in 1895. Her successes were altogether in the field of emotional acting. In 1905 she founded the Théâtre Réjane in Paris.

REJECTED ADDRESSES. Burlesque poems by James and Horace Smith, published anonymously in 1812. Ostensibly unsuccessful efforts in the competition for the opening of the new Drury Lane Theatre at that time, they were amusing parodies on the poems of Wordsworth, Southey, Coleridge, Byron, Scott, and others.

REJOIN'DER (OF., Fr. *rejoindre,* to rejoin, from Lat. *re-,* back again, anew + *jungere,* to join). In common-law pleading, the answer of a defendant to a plaintiff's replication to his (defendant's) plea. See PLEADING.

REJU'VENA'TION, or REJUVENESCENCE. It is supposed by Maupas and others that the process of conjugation in the Infusoria (q.v.) results in increased vigor and vitality and is thus advantageous to those organisms in which the most primitive form of reproduction is by simple self-division. Indeed it has been observed that conjugation results in increased activity in multiplication by fission. So also sexual reproduction is a rejuvenizing process and tends to prevent both the individual and the species from deteriorating or running out. It may be said to correspond in its effects to cross-fertilization, which is the antidote to too close inbreeding and tends to enhance the vitality of the species and prevent degeneration. In botany, rejuvenation is a term for the transformation of one cell into another, i.e., into a primordial cell, which afterward secretes a new cell wall and forms the starting point of the life of a new individual. See GROWTH.

REKHTA, rāk'tà. See HINDUSTANI LANGUAGE AND LITERATURE.

RELAPSE, THE; OR VIRTUE IN DANGER. A comedy by Sir John Vanbrugh, produced in 1697. It was written as a sequel to Cibber's *Love's Last Shift,* and was very popular throughout the eighteenth century. It was imitated by Lee in *A Man of Quality* (1776) and recast by Sheridan as *A Trip to Scarborough* (1777). Voltaire used it as the basis of *Le Comte de Boursoufle* (1734). Later versions were made by Hollingshead in *Man of Quality* (1870) and Buchanan in *Miss Tomboy* (1890).

RELAPSING FEVER (from Lat. *relapsus,* p.p. of *relabi,* to fall back, from *re-,* back again, anew + *labi,* to slip), FAMINE FEVER, or FEBRIS RECURRENS. A specific infectious and contagious disease, generally occurring in epidemics and due to a microörganism, the *Spirochæta obermeieri.* This organism is a spirillum, about $\frac{1}{500}$ of an inch in length and undergoing constant movements of a rotary or lashing character. The disease occurs in times of famine and flourishes under conditions of overcrowding, dirt, and poverty. Individuals in constant contact with the disease, as physicians, nurses, and clergymen, are often attacked. The peculiar nature of the malady was pointed out by Henderson in 1842 and by Sir W. Jenner, 1849 to 1851. Their views have since been confirmed by the discovery of the specific microörganism by Obermeier in 1873.

The disease is communicated from one person to another by bloodsucking insects, especially the bedbug, *Cimex lectularius.* African relapsing fever is carried by a tick and is known as tick fever. The specific organism is the *Spirillum duttoni.* The period of incubation of relapsing fever averages from 4 to 10 days. The fever begins suddenly with a chill or rigor, accompanied by frontal headache and pains in the back and limbs. The temperature may be 103° or 104° F., and mounts on the succeeding days to 105° or 106°. The general condition remains much the same for about a week, except that the symptoms increase in severity. Little sleep is obtained, but the mind remains clear. When all the symptoms are at the height, crisis suddenly occurs in five to seven days, with profuse perspiration and a rapid abatement of suffering. Convalescence now sets in and is permanent in many cases. In others the patient feels comparatively well but very weak until about 14 days from the initial attack or 7 days after the crisis, when he is again seized with chills and fever and the whole series of phenomena is repeated. This relapse is usually shorter than the first paroxysm, and permanent recovery follows it in the majority of cases.

The spirilla are present in the blood during the paroxysms and increase in number as the fever progresses. They disappear at the crisis and remain absent until near the advent of the relapse. During this period they may be found in the spleen and bone marrow (as proved by experiments on monkeys), where they probably break down and leave spores which germinate and thus produce the organisms which determine the relapse.

No treatment has succeeded in shortening the paroxysms or preventing the recurrence of a relapse; and although certain drugs, such as quinine, carbolic acid, and iodine, arrest the movements of the spirillum outside the body, they have no influence when given as remedies. Treatment must be symptomatic. Sponging with tepid water or packing in wet sheets will give temporary relief when the fever is very high, and headache may be relieved by cold applications. The disease is rare in the United States.

RELA'TIONS (Lat. *relatio*, relation, reference, report, restoration, from *re-*, back again, anew + *latus*, p.p. assigned to *ferre*, to bear, carry). In the strictest sense, the kindred of a person, i.e., such as are related to him by ties of blood, to the exclusion of connections by marriage. In American law, however, the term is sometimes employed in a wider sense to comprehend all who are entitled under the statutes of distribution to share in the personal estate of a deceased person, including connections by marriage as well as by consanguinity. Consult James Kent, *Commentary on American Law* (14th ed., 4 vols., Chicago, 1896), and Sir William Blackstone, *Commentaries on the Laws of England* (4th Amer. ed., 2 vols., ib., 1899). See AFFINITY; CONSANGUINITY; LINEAL.

RELATIONSHIP. The exact degree of affinity existing between keys, chords, and tones. See TONALITY

REL'ATIVE, IN LOGIC. See ABSOLUTE.

REL'ATIV'ITY (from Lat. *relativus*, having reference or relation), LAW OF. In its most general form, the law, as given by Stumpf, is that the relation of sensations to one another is essential to their very existence; so that black, e.g., can be sensed only in opposition to white, or at least only in distinction from a grayer or blacker black; a tone or noise only as alternating with other tones or noises or with complete silence, and so on; while every sensation will disappear under the operation of uniform and continuous stimulation. Simple as this statement looks, it is capable of many interpretations, none of which can be regarded as unexceptionable. The grain of truth which Stumpf finds in the doctrine is that the presence of sensation in the adult consciousness is almost without exception connected with certain judgments of its relation to other ideas. And these judgments (apprehensions, apperceptions), if they cannot alter the content of sensation, can at least render it confusable with other contents not now sensed.

Wundt, on the other hand, has consistently maintained that our mental life is governed by a law of relativity, such that every phase of present experience is conditioned not only by other phases of the same experience, but also by the whole past history of consciousness. The laws of mind at large are of two classes, laws of relativity and laws of development. Under the heading of relativity we have (1) the law of psychical resultants, which affirms that every mental complex shows properties which, once given, can be understood from the attributes of its elements, but which cannot be regarded as a mere sum of those attributes. (2) The law of relations asserts that every dissection of a conscious whole into its constituent terms is an act of relating analysis. Finally, (3) the law of psychical contrasts maintains that mental processes of opposed direction mutually reënforce one another. The laws of mental development are (1) the law of mental growth, the application of the law of resultants; (2) the law of heterogony of ends, based upon the laws of resultants and of relations; and (3) the law of development by opposites, which applies the law of contrasts.

Hartmann, *A New Conception of Relativity and Locke* (Cincinnati, 1914).

RELATIVITY, THEORY OF. A physical theory first advanced by Einstein in 1905. Its peculiar novelty consists in its radical revision of our ideas of space and time. The scientist distinguishes between absolute and relative concepts. An absolute statement is valid for every one without qualification. Thus, the statement that there are 100 pages in a certain book and similar statements regarding number belong to this class of ideas. A relative concept has meaning only relatively to certain other ideas or conditions, and these must be stated in order to complete the meaning. The notion of position in space is a good example of this class; it is not possible to state where a thing is except with reference to other things. The history of the progress of science has been one of continual shifting of concepts from absolute to relative and vice versa. Thus, to the people of the Middle Ages, believing in a flat earth which was the centre of the universe, "up" was an absolute notion. To-day we regard "up" as a direction which is only defined relatively to a particular observer at a particular time, so that it does not mean the same direction to any two men or to the same man at different times.

Consider now whether velocity is to be considered as an absolute or relative concept. When we say a thing moves we always mean relatively to certain other things which we assume to be at rest. A train moves relatively to the earth, but it is equally true that the earth moves relatively to the train. The earth also moves relatively to the sun, and so on. The set of objects which we regard as at rest in order to describe the motion of others constitute a "system of reference." At first sight it would appear as if motion were necessarily a relative concept, but this is not the case; for there might exist one system of reference characterized by the fact that the laws of nature would appear simpler to observers stationed on it than to those on any other system. This would constitute a unique natural system of reference which could be singled out by any observer in the universe and which would therefore serve to define "absolute velocity." Now, it has long been recognized that the laws of mechanics could furnish no such system; i.e., that these laws would appear the same, say to observers on the earth, as to those on another planet moving with any constant speed in a

straight line (uniform motion) relatively to the earth. It was thought to be otherwise with the laws of electricity and magnetism, including those of light, for the luminiferous ether which was supposed to fill all space might furnish such a system. Light being regarded as a wave motion in the ether, a flash of light sent out from any point would travel with uniform speed in all directions relatively to the ether. If, now, the various parts of the ether were at rest with respect to one another so that it could be regarded as a sort of immense stagnant sea filling all space, then motion relatively to the ether would mean the same thing to every observer in the universe and would thus be an absolute concept.

The phenomena of stellar aberration first observed by Bradley in 1728 indicated that there is no relative motion of the parts of the ether between the earth and the stars. The earth travels in a closed orbit around the sun at a speed of about 19 miles a second, and hence at some time of the year must be moving with at least this speed relatively to the ether. Now, if light travels with a definite velocity relatively to the ether, its velocity relatively to the earth would be less if it were overtaking the earth than if it were meeting the earth. The experiment in this form cannot be carried out with sufficient exactness, but equivalent experiments made by different observers failed to show any effect whatever of the earth's motion on electromagnetic phenomena, although the expected effects were of such size that they should have been easily observable. These negative results constitute the fundamental disagreement of facts with existing theories which it is the purpose of Einstein's theory of relativity to explain.

Einstein starts from two assumptions. The first states that if we have a system of reference for which the established laws of physics hold, these same laws would hold for any system moving relatively to it. This in effect denies the possibility of an observer stationed in any one of these systems detecting anything about its motion save its motion relatively to the other systems; it therefore erects into a cardinal principle the negative results of the Michelson-Morley and similar experiments. Einstein's second assumption is that the velocity of light is a constant which is independent of the state of motion of the emitting body—an assumption which we have seen is a consequence of the older theory of the ether, but which in combination with the first leads apparently to hopeless absurdities. For since by the first assumption only the relative motion of the source of light and the observer matters, it follows that the velocity must also be independent of the motion of the observer. Thus, if the observer were moving away from the source with a velocity of 100,000 miles a second, the light, leaving the source with a velocity of 186,000 miles a second, would pass the observer with its full velocity. The velocity of light is thus the same relatively to all observers, whatever their velocity with respect to the source. Einstein seeks the key to this apparent contradiction in a revision of our ideas of space and time.

When the physicist speaks of the time of an event, he has no concern with metaphysical ideas; he means simply a definite number obtained by a definite experiment. He chooses a particular process (the rotation of the earth upon its axis) and a scheme for giving numbers to this process; thus, 4.30 P.M. indicates a certain orientation of the earth with reference to the stars. Any event which is simultaneous with a given position of the earth is said to happen at the time indicated by that position. The rotation of the earth has been chosen to measure time because the laws of nature can be described in simpler terms by the use of this time than by other time-measuring processes. We shall speak hereafter of the standard process, or of an instrument whose indications correspond to it, as a clock. It is important to understand that the physicist deals only with concepts through the experimental processes which define them; so that when he speaks of the properties of time he means properties of the indications of standard clocks, these properties being determined by experiment. Our judgments of time are judgments of simultaneity. How then are we to determine that an event happens, say, at 4.30?

If the event happens at the same place as our clock the problem offers no difficulty. But suppose the place of the event is remote from the clock; to be concrete, how would we find the time of an event on Mars? Note that this requires fresh definition. One way would be to assign the time at which we see it happen Experiment has shown that in this case the time would depend on our distance from Mars; in fact it was in this way, by observations on the satellites of Jupiter, that Romer discovered that the propagation of light was not instantaneous. To avoid this ambiguity it is necessary to make allowance for the velocity of light, but how is the amount of this allowance to be determined?

Einstein's method is the following: we send a light signal to Mars which is reflected back immediately to the earth; the time of its sending and return are observed, and the time of its arrival on Mars is defined to be halfway between these two; an observer on Mars could thus by noting the time of its arrival set his clock to earth time. Now this process would be valid on the old view of the ether, irrespective of the motion of Mars, provided only the earth were at rest in the ether; for it assumes that the light takes the same time going and coming. On the theory of relativity the process is valid provided the two planets are at rest relatively to one another; so that all clocks belonging to a given system of reference can by this process be made to keep the same time, as seen by observers in the system. Now follows, however, the remarkable consequence that to observers on a different system the clocks on the earth system would not keep the same time. Thus, a Martian event which to observers on the earth happened at 4.30 would to an observer on a planet which was moving with respect to Mars and the earth happen at a different time, perhaps at 4.25. The Martian event would be simultaneous with a different set of earth events according to the system from which it might be observed. This may be summed up by saying that simultaneity becomes a relative concept.

We make no attempt to give the mathematical steps by which the foregoing consequence is deduced. Other results which may also be shown will be briefly enumerated. It can be shown that two similar clocks in different sys-

tems will each run slow relatively to the other, the amount of the slowing depending on the relative speed of the two systems. Again, the dimensions of bodies will be shortened along the line of motion, as seen from the second system; masses will be increased, and so on through a long list of physical quantities All of these, formerly regarded as absolute concepts, become definable only when the relative motion of the observer and the phenomena is given. A notable exception is the quantity of electricity on an electrically charged body; this is still definable absolutely.

If the theory stands the test of future criticism, it will make profound changes in all physical theory. Nevertheless it must not be supposed that the theory makes useless the older conceptions, for the corrections introduced in any actual experiment by the motion of the earth are too small to be observable save in the most refined electrical and optical experiments.

Credit for the actual theory belongs, as has been said, to Einstein; other names should however be mentioned. The work of H. A. Lorentz paved the way, while Minkowski has given the theory a mathematical form which has made its application much easier.

RELAY', IN MOTOR VEHICLE. See MOTOR VEHICLE.

RELEASE'. In the most general sense, any act, event, or transaction by which a legal right is discharged. In this sense of the term a right of action based upon a personal tort may be released by the death of the tort-feasor, or a debt released by the discharge in bankruptcy of the debtor, as well as a bond or a right of entry upon land released by the deed of the person claiming the right. We may, perhaps, conveniently distinguish two separate and distinct types of release as still existing, viz., the ordinary release of a debt or obligation and the release of an interest in or claim to land.

The former of these may be effected by act of the parties or by operation of law, as where a contract for personal services is terminated by the death of a party thereto. At common law, however, the forgiveness of a debt, whether complete or partial, is not legally binding if made by parol or simple contract, but requires a release under seal to render it effectual and irrevocable.

The second form of release above referred to is best described as a form of conveyance of real property at common law. Its distinguishing characteristic is the fact that it is in and of itself not available for effecting a conveyance to a stranger, i.e., to one having no interest in the land in question (for which purpose the feoffment or the grant must be resorted to), but only to one in privity of estate, i.e., having an interest with the releasor in the same parcel of land, as a wife of her dower right to the husband's grantee, or a landlord, remainderman, or person asserting any other claim in relation to the premises to a tenant in possession.

In this form of a conveyance of the landlord's estate to his tenant in possession the release played a distinguished part in the history of conveyancing. In the effort to attain a simpler and more private method of conveying freehold estates than the ancient and cumbrous process of livery of seisin, the lease and release were ingeniously combined in a single transaction. Thus, if the land to be sold by A to B was first leased to B for a year, B would by taking possession of the land come into the requisite privity of estate with A to enable the latter to complete the transfer of title by releasing his reversion to B.

Analogous to the first form of release above described, but still operating as a common-law conveyance, is its use to convey doubtful or precarious interests in land or rights in land which do not rise to the dignity of estates, as a contingent remainder to the freeholder who was seised of the land or the right of a disseisee to the disseisor or other person seised of the land.

In form the deed of release is substantially reproduced in the modern quitclaim deed. See CONVEYANCE; DEED; DISSEISIN; ENTRY, RIGHT OF; GRANT; REMAINDER; and consult references there given.

RELI'ANCE. An American racing yacht. See YACHTING.

RELICS (OF., Fr. *relique*, from Lat. *reliquæ*, remains, from *relinquere*, to leave behind, from *re-*, back again, anew + *linquere*, to leave, Gk. λείπειν, *leipein*, Skt. *ric*, to leave). In ecclesiastical usage, the remains of the bodies of saints; more loosely, objects connected with the earthly life of Christ or of the saints. At an early period miracles are described as connected with relics. Altars were early erected over the tombs of the martyrs, and the present practice of the Roman Catholic church requires the inclusion of some relic or relics within every altar to be consecrated.

The veneration of relics found no important early adversary. One of the treatises of St. Jerome, indeed, is directed against the objections of Vigilantius on this point; but even the Iconoclasts, while vehemently repudiating the use of images, admitted the veneration of relics, and, with the exception of the Waldenses, Wiclif, and some others, it was practically unchallenged until the sixteenth century, when Protestants generally repudiated it entirely as superstitious. The decree of the Council of Trent connects the question with the general one of the veneration to be paid to the saints, and regards the relics of the saints, not as possessing any intrinsic virtue, but as instruments through which God bestows benefits on men. Various relics of Mohammed and other Moslem worthies are preserved at Mecca, Medina, Constantinople, and other places; and relics of the Buddha received the reverence of the Buddhist world. A shrine in Kandy, Ceylon, still claims the possession of a tooth of Buddha. Consult Stephen Beissel, *Die Verehrung der Heiligen und ihrer Reliqueren in Deutschland* (2 vols., Freiburg, 1890–92), and Friedrich Pfister, *Die Reliquienkult in Altertumer* (Leipzig, 1909). See CROSS; HOLY COAT; PILGRIM; SAINT.

RELICT' PLANTS (OF. *relict*, from Lat. *relictus*, p.p. of *relinquere*, to leave behind). Plants of very restricted distribution, but formerly more widespread. For example, the big trees of California are the remnants of a former widely distributed group. The term may also

be applied locally to species which belong to a former topographic condition when they were abundant.

RELIEF (Lat. *relevamentum*). An incident of the feudal tenure of lands. It consisted in the obligation of the heir to redeem the land from the lord of whom it was held, in order to make good his right of inheritance. Unlike the more burdensome incidents of wardship and marriage, it attached not only to lands held by knight's service, but was levied equally on the heir of socage lands. Originally of indefinite amount and depending largely on the arbitrary will of the lord, it was at an early period fixed and regulated by statute. Of all the incidents of feudal tenure it had the longest life, not only surviving the gradual disappearance of military tenures, but being expressly saved in the Statute of 12 Charles II (1660), which abolished tenure in chivalry and relieved all tenures of their more burdensome incidents. The right of relief was never expressly abrogated, but it has fallen into desuetude in England, and there is no evidence that it was ever exercised in the United States. See FEUDAL TENURE: INCIDENT.

RELIEF SCULPTURE. That form of sculpture in which the objects represented project from the surface or background. In the fine arts the term "relief" is used to signify any projection of figures from the surface; it is so used in painting for the apparent projection of forms and masses from the background, in architecture for projection of decoration, and in a similar manner in ceramics, goldsmith's work, etc The term is, however, mostly employed in reference to sculpture. Relief sculpture differs from sculpture in the round in that it is attached to the background, from which the latter stands free, being visible from all sides. It is not always possible, however, to distinguish the boundaries between these two chief classes of sculpture. See SCULPTURE.

The two principal varieties of relief sculpture are: high relief, usually known by the Italian name *alto-rilievo* (q.v.), in which the objects project strongly from the background; and low relief (It. *basso-rilievo;* Fr. *bas-relief*), a surface ornamentation in which the projection is very slight. Midway between the two is semi-relief (It. *mezzo-rilievo;* Fr. *demi-relief*), in which the figures are fully rounded, but without detached portions. *Stiacciato* (It., crushed, flattened) is the slightest form of relief, being little more than scratchings upon the surface, while in the hollow relief (*cavo-rilievo*) (q.v.) the contours of the figures are carved below the surface of the background. In nearly all relief work figures and background are of the same material, though there are some examples to the contrary in best Greek art and in Chinese and Japanese decorative work. The materials generally used in larger relief work are marble, bronze, and sometimes terra cotta, and in smaller decorative work the precious metals and stones, enamel, ivory, wood, etc., are more common. Reliefs were almost universally colored by the Egyptians, in classical antiquity, and often in early Christian art. This practice prevailed in wood, terra-cotta, and stucco work during the Gothic and Renaissance periods, while marble and stone were not usually colored.

History. Relief is that form of sculpture which most resembles painting, with which it has composition and perspective in common. In the history of relief work, therefore, the practice has swayed between purely plastic and pictorial principles. Relief was practiced contemporaneously with sculpture in the round by the early culture peoples, like the Babylonians, Assyrians, and Hittites. The Egyptians made a very wide use of hollow relief. The Greeks conceived relief in a purely plastic sense and achieved the highest mastery of it. Distinguishing strictly between high and low relief, they used the former between the triglyphs and in the tympana of the temples, but the latter in friezes, gravestones, and the like. Purely decorative principles were strictly followed, the space being adequately filled, the background never carved, and the heads of the figures at the same height. (See GREEK ART.) During the Hellenistic period a more picturesque and dramatic composition was practiced, and subjects were carved in the backgrounds—a practice which in Roman times degenerated into the use of several different planes of reliefs. Picturesque relief attained its most perfect development at Florence during the Renaissance, in such works as the baptistery doors of Ghiberti and the marble pulpit of Santa Croce by Benedetto da Majano. In these works all the qualities of painting except color were reproduced. Donatello, Luca della Robbia, and other sculptors of the Renaissance followed plastic laws more strictly, but during the entire baroque period picturesque principles prevailed to such an extent as to preclude any real style of relief. At the beginning of the nineteenth century Thorvaldsen, inspired by the study of Attic grave monuments, brought back relief to its proper plastic function. Since that time excellent relief work has been frequent, in Europe as well as in America. The present tendency, however, is to neglect the distinction between high and low relief and to give rather undue emphasis to pictorial qualities. For bibliography, see SCULPTURE.

RELIEF SYNOD. See PRESBYTERIANISM.

RELIG'IO MED'ICI (Lat., A Physician's Religion). A prose work by Sir Thomas Browne (1643), the devout musing of a scholar and man of science.

RELIGION (Lat. *religio*, probably from *religare*, to bind fast, from *re-*, back again, anew + *ligare*, to bind), COMPARATIVE. The science which treats of religions from an historical and comparative point of view. Its methods are first descriptive, then historical, and finally comparative. The descriptive part of comparative religion discusses the actual phenomena presented by religion, and includes treatments of individual religions. Even in such an individual discussion the comparative method must be employed if the phenomena presented by the religion in question are to be correctly interpreted. The historical aspect considers the development of a single faith from its origin or from its earliest ascertainable manifestation. The historical side of comparative religion, therefore, is evolutionary in character. The comparative side seeks to discover the laws of religious evolution working in all religion. The final object of the science is to investigate the nature and development of religious beliefs and to discover if possible the origin of religion itself. Comparative religion therefore ranks as one of the historical sciences.

Many definitions of religion have been given, varying according to the factors of religion

which have been emphasized. A fundamental distinction may be made between definitions in terms of object and in terms of experience. The first class defines religion as an attitude of conduct and life directed towards a power without. In this class of definitions a god, or some power which takes his place, is regarded as an essential to religion. The greater number of definitions fall under this class. Such are: the natural belief in a power or powers beyond our control and upon whom we feel ourselves dependent (Jastrow); the worship of higher powers from a sense of need (Menzies). It is possible, however, to consider the essence of religion as experience without regard to the object towards which it is directed. By these definitions a god is not necessary for a religion. The most famous definition of this class is that of Schleiermacher: religion is a sense of infinite dependence. This is inadequate, because it makes religion merely a feeling. A common definition of this class is: religion is that to which a man attaches supreme value; that which he would rather die than give up. Early religion, however, can hardly be said to have been so lofty a moral structure. In recent years the emphasis of the social element, especially in early religion, has led to a new group of social definitions, of which an example is: religion in its first form is a reflection of the most important group interests through social forms and ceremonies based upon the activities incident to such interests (Ames).

The classifications of religion have been even more various than the definitions. The division of religions into true and false and into monotheistic and polytheistic belong to prescientific days. The present tendency is to classify religions according to the stage of culture which they represent and, among the religions of civilized races, according to whether the religion makes its appeal to single races or to all men. This gives a division into primitive or tribal, national, and individual or universal religions, the last two being the religions of more or less advanced cultures.

It is impossible to recover the origins of religion. The present lower races do not represent early man in all respects. While the first religion must have been like the religions of present races of primitive culture in those particulars which express a simple and somewhat childlike idea of life and its relations, yet comparative religion does not claim to be able to produce an exact picture of the earliest religion. It is content to begin the study of religion with the most primitive races now existing.

Primitive races, with all their differences in detail, present essentially the same characters in all parts of the world. One of the things which they have in common is religion, and since the mental qualities of all primitive races are much the same, their religions are also much the same. They rest on animism, which is the assumption that all objects possess life and so are like man. This universal assumption ascribes conscious life to the sun and moon, to animals, trees, rocks, springs and rivers, mountains, winds, the rainbow, anything which attracts attention. If these objects are supposed to affect the life of man in any way, then there is the desire to gain their friendship and favor, which soon grows into an attitude that is worship. Whether primitive religion always regards the powers to be conciliated as animated and personal is debated. There seems to be evidence that they are sometimes regarded merely as powers undifferentiated and unpersonified. The Melanesian word *mana* and the Australian *churinga* are terms which represent powers respected and feared but seemingly not personified. Two classes of objects possessing power are found in all primitive religions—nature objects and spirits. The nature objects may be great, like the sun or sky, or lesser, like the trees and rocks. The former allow of worship anywhere, and so put no hindrance on the migration of the tribes of their worshipers. The latter originate local worships and tend to bind their worshipers to a single locality.

Spirits may be spirits of localities or spirits of the dead, especially of ancestors. The belief in spirits seems to arise from the fact that in dreams the dreamer seems to be able to leave the body and to meet other people, even those who are dead. Obviously, then, there must be life apart from the body. These nature objects and spirits are not necessarily gods, but they are the stuff from which gods are made. Gods are superhuman powers, in definite control of some department of nature or of human life, to whom men must appeal for some needed good. The method of approach to the gods was at first simple and needed no priest. All knew the rites, and the head of the household performed them. The origin of the priest, like that of the carpenter, was due to the social convenience of the division of labor. Even before the priest came the inspired man, who because of certain experiences was believed to be in personal communion with the gods. He is the central Asian shaman, the medicine man of the American Indians, the early Semitic prophet. Magic and totemism (qq.v.) are found in connection with primitive religion. While their origin and relation to religion are subjects of much discussion, it is certain that they are in essence not religious. The chief characteristic of primitive religion is the fact that it is a tribal matter. The god cares only for the tribe, and he who leaves the tribe leaves the god. Sacrifice and other worship are tribal, and the god had no relation to individuals apart from the tribe.

The next stage of religion is the national. When by conquest or assimilation the tribe becomes a nation, a correlative change takes place in the religion. The gods become greater and better, since they must do justice to more people. But they are also more remote, as the king is more remote from his people than the tribal chief. Worship grows in splendor. This is the period when great temples and magnificent rituals are natural. The orders of priesthood obtain greater power. The religion becomes centralized. Taboos grow in strength. Nothing pertaining to the god must be treated as common. Gifts and sacrifices become more costly. The stately and solemn worship furnishes a basis for an emotional religion, but its natural expression is not in the wild orgies frequent in tribal religion. The gods are still, however, national gods, and their care and favor are limited to the nation. All members of the nation are worshipers of the national gods, not, however, as individuals, but because they are members of the nation. Excellent examples of national religion are the Phœnician and the Babylonian religions and the religion of

Israel before the rise of Hebrew prophecy. The individual or universal religions arise out of the national by the breakdown of nationalism, as when the Hebrews were forced into the exile; by the emphasis on the universality of an order of the world, as in Confucianism and Taoism; or by the rise of men of ethical or philosophical insight, like the Hebrew prophets, Buddha, the Hindu philosophers, Zoroaster, and Mohammed. This type of religion is no longer limited to any particular place or race. The god is regarded as standing in relation to all men. All individuals are seen to stand in relation to one cause of life, one moral law. This makes a tendency to monotheism in religion and a unitary view of the world in philosophy. It is expressed by the one God of the Hebrews and the Christian religion, the one Tao or order of the world of the religions of China, the one Supreme of Vedantism. Logically such a religion ought to be a missionary religion. Ritual and priesthood should disappear, except as they may be used to assist the individual in realizing his privilege of immediate relation to the Supreme Power. The highest ideal of the religion is perfect harmony of will between that Power and man. Society becomes perfect when the harmony is world-wide. The ideal remains the same whether the Power be considered, as in Christianity and Islam, a personal God, or, as in Confucianism and Buddhism, an order of the world, or, as in Hindu philosophy, a central soul of the universe. These religions always contain survivals of the earlier stages through which they have passed. Sometimes they are definitely mingled, as Judaism, which contained elements of the old national religion embedded in a body of prophetic universalism. Occasionally they even start as universal religions and end with national limitations, as did Zoroastrianism. Three of the religions have so far emancipated themselves from national limits and spread to various races that they are especially known as the universal religions—Buddhism, Islam, and Christianity. Religion has no further stage, for this stage includes the whole race of men. There is no wider field into which it can expand.

Religion, like other phases of human activity, exhibits more variation as it rises in culture. Comparative religion is largely occupied with the study of the great religions, in which the religious aspirations of great civilizations have found expression. The science is concerned with their characteristics, with the changes which they have undergone and the reasons therefor, with their successes and failures, in order to find, if possible, the laws which govern the evolution of religion.

The study of comparative religion is of modern origin. It is indeed true that we find in the histories of Herodotus, in the *De Iside et Osiride* of Plutarch, in the *De Dea Syria*, generally ascribed to Lucian, in the *Germania* of Tacitus, and in brief mention in numerous other classical authors accounts of religions other than Greek or Roman. Yet here the historic knowledge was too slight to render the philosophical part of the work anything but superficial, although the descriptive part is still of value. It is noteworthy that the first real impulse to an historical study of religions came with the sixteenth and seventeenth centuries. To this early period belong such books as the *Pansebeia, or View of all Religions of the World*, by Alexander Ross (London, 1653; 4th ed., enlarged, 1672), and the *Ceremonies and Religious Customs of the World*, by Picart and Bernard (ib., 1733). This latter work is in a sense the forerunner of the historical method of religious study, and is far superior to one of its most important successors, the *Origine de tous les cultes, ou religion universelle*, by C. F. Dupuis (Paris, 1795; new ed., 10 vols., ib., 1835–36). The real founder of the historical school, however, was J. G. von Herder, who outlined the history of religion, so far as it was then possible, in his *Ideen zur Philosophie der Geschichte der Menschheit*, published at Leipzig in 1784, although his previous writings indicate that many of his ideas on this subject had been formulated much earlier. The year after Herder's *Ideen* saw the publication of C Meiners's *Grundriss der Geschichte aller Religionen*, followed 21 years later by his *Allgemeine kritische Geschichte der Religionen*. In the decade 1821–31 the foundations of a scientific philosophy of religion were laid by G. W. F. Hegel in his *Vorlesungen über die Philosophie der Religion* (not published, however, until 1832). The credit of inaugurating the study of comparative religion in a truly scientific spirit and method, however, must be given to Max Muller, even though his views are now in great part rejected in the light of later investigations. In a long series of volumes, including *Lectures on the Science of Religion* (London, 1872), *Physical Religion* (ib., 1890), *Anthropological Religion* (ib., 1891), *Natural Religion* (2d ed., ib., 1892), and *Theosophy or Psychological Religion* (2d ed., ib., 1899), he developed his system He also aided in the establishment of the Hibbert lectures on the origin and growth of religion in 1878, and above all founded in 1879 the epoch-making series of translations entitled *The Sacred Books of the East* (50 vols., London, 1879–1910). A still greater name than Max Müller's is that of C. P. Tiele, of Leyden, whose *Outlines of the History of Religion* (translated from his Dutch *Hoofdtrekken der Godsdienstwetenschap* into English by J. E. Carpenter, London, 1877; new ed., New York, 1905; 3d Ger. ed. by Weber and Söderblom, Breslau, 1903) were at the time of publication the best general survey of religions from an historical and descriptive point of view, while his *Elements of the Science of Religion* (Edinburgh, 1897–99) and his *Geschiedenis van den Godsdienst in de oudheit tot op Alexander den Groote* (Amsterdam, 1891–97) are no less authoritative. In France the study of comparative religion received a powerful impetus in the establishment in 1888 of the Musée Guimet. In America there is a rapidly growing interest in this science, both in academic and in more general circles. Cushing, *Zuñi Tales* (New York, 1902). The two most important periodicals devoted to comparative religion are the *Revue de l'Histoire des Religions* (Paris, 1880 et seq.) and the *Archiv für Religionswissenschaft* (Freiburg, 1898 et seq.).

RELIGIOUS AND MORAL EDUCATION IN SCHOOLS. See SCHOOLS.

RELIGIOUS EVOLUTION. See EVOLUTION.

RELIGIOUS LIBERTY. See LIBERTY, RELIGIOUS.

RELIGIOUS ORDERS. See MONASTICISM; ORDERS.

RELIGIOUS SOCIETIES. In the legal sense corporations formed for the advancement of religion or the administration of church property for religious purposes. To the efforts of religious corporations in the Middle Ages to acquire vast holdings of land was due the enactment of the various English statutes of mortmain (q.v.) which at first restricted the power of such corporations to acquire lands and later absolutely prohibited the conveyance of lands to them by any subject of the crown. Most of the States of the United States now have general laws governing the formation of religious corporations and defining their powers. Generally there is no limit to their power of acquiring land for church purposes, and all their property used directly for church or religious purposes is exempt from taxation. See CANON LAW; CORPORATION; and cf. CIVIL CHURCH LAW; CLUB.

RELIGIOUS SOCIETY OF FRIENDS. See FRIENDS.

RELIGIOUS TRACT SOCIETY. See TRACT SOCIETIES.

RELIQUARY (ML. *reliquare, reliquarium*, from Lat. *reliquiæ*, remains). A receptacle for preserving sacred relics. Reliquaries may be of any material; the finest are of ivory or of silver, enamel, gold, or crystal, ornamented with costly jewels. Shrines are large reliquaries permanently fixed in place. Reliquaries are among the most consummate masterpieces of mediæval minor art, especially metal work. Particularly famous are such mediæval reliquaries as those of San Marco at Venice and of the cathedrals of Aix-la-Chapelle and Cologne. The reliquary in the form of a church in the cathedral of Orvieto is one of the most wonderful pieces of thirteenth-century goldsmith work, with exquisite details. The Romanesque and Gothic periods (eleventh to fifteenth centuries) were the golden age of such work. At first the Rhenish and Flemish schools were easily preeminent, but in the thirteenth century Italy and France surpassed the northern schools. Reliquaries were of many shapes. They often took the form of the relic they contained, such as a hand, a foot, or a head. They were nearly always decorated with minute figures in relief or even statuettes, or with colored enamels and ornamental designs. The Renaissance produced fewer masterpieces; the finest is the shrine of St. Dominic in San Domenico at Bologna.

RELIQUES (rē-lēks') **OF ANCIENT ENGLISH POETRY.** A collection of old ballads and lyrics (1765), taken by Thomas Percy from an old manuscript of the early seventeenth century, which he found at a friend's house in

REMBRANDT

"THE SYNDICS OF THE DRAPERS," FROM THE PAINTING IN THE RIJKS MUSEUM, AMSTERDAM

A very important event in Rembrandt's life was his marriage in 1634 with Saskia van Uylenburgh, daughter of a burgomaster of Friesland, who brought him a handsome dowry. Their happy union was the inspiration of many of his best works. After her death in 1642 he withdrew even more from the world, especially after his financial misfortunes, which censorious biographers have ascribed to dissipation and extravagance, but which was rather due to his ignorance of money matters, his generosity, a financial panic of the day, and to the change in public taste. In 1657 his creditors sold his wonderful collection, including several of his own paintings, for the pitiful sum of 5000 florins, and in 1658 his house for 11,000. But Titus, Saskia's son, and Hendrickje Stoffels, a young woman who had become his housekeeper in 1649, formed a partnership for the disposal of Rembrandt's pictures and rented a small house in the Rozengracht, paying the artist a stated yearly salary. After 10 years of toil the old artist satisfied his creditors. The stories of his dissipation and low associates in later life are unfounded. His chief associates were artists and he was interested in the picturesque inhabitants of the Ghetto; but he also had more influential friends, like Jan Six. Hendrickje died in 1664, leaving a daughter Cornelia, and Titus in 1668. Rembrandt himself died poor and forgotten, and was buried in the Westerkerk, Amsterdam, on Oct. 8, 1669.

His art reflects in a unique manner the sentiments and emotions of his eventful life. More than any other he depicts the inner life and is the painter of the soul. A masterly technician when he so desired, he is more often the dreamer, the painter of things unseen. This he achieved by an unequaled mastery of light and shadow, which forms the chief technical characteristic of his works and lends to them the deep poetic charm which makes them so attractive. He is preeminently the poet painter. His early pictures are painted with somewhat detailed execution and light color, but he increasingly uses a broader brush and richer color in harmonies of gold and brown. Later in life his painting becomes highly impasto, almost decorative in character. He exercised great influence upon the art of his day, and during the nineteenth century was the model and inspiration of many German and Dutch painters. Among his many pupils were Gerard Dou, Govaert Flinck, and Ferdinand Bol.

Rembrandt was preëeminent in portraiture, and no artist has succeeded better in rendering the head in a realistic, characteristic, and at the same time in a picturesque manner. Among his numerous portraits, some of the most interesting are those of himself and of his family. Of the former, which are the most numerous, the best-known youthful examples are in the Pitti Gallery (Florence) and at Budapest. In middle life there are fine examples in Dresden, Munich, the National Gallery (London), the Louvre, and elsewhere, and in old age the grand examples in the Frick collection, New York, in Vienna, in London, and in the Louvre. The best portraits of Saskia are at Dresden and Cassel, and a beautiful portrait of both is the so-called "Wedding Breakfast" at Dresden The finest likeness of Hendrickje is at Berlin; of Rembrandt's mother, at Vienna; of his son Titus, in the Metropolitan Museum, New York, at Vienna, and elsewhere. Among other famous portraits are: a "Money Changer" (1627, Berlin); the "Naval Architect and his Wife" (1630, Buckingham Palace); "Polish Nobleman" (1631, St. Petersburg); the poet Krul (1633, Cassel); the "Mennonite Preacher Aanslow Consoling a Woman" (Berlin Museum); the so-called "Frame Maker" (1640, Havemeyer collection, New York); the "Lady with a Fan" (1641, Buckingham Palace); Elizabeth Bas (1642, Amsterdam); "Jan Six" (1654, Six collection, Amsterdam); the so-called "Jewish Bride" (Amsterdam); and the "Architect" (1656, Cassel). Of his "Rabbis" examples are in Buckingham Palace and (his best) in St. Petersburg. Of his numerous "Old Women" the best known are in London and St. Petersburg.

Rembrandt's most ambitious efforts in portraiture were groups similar in character to those of Hals. The masterpiece of his earlier full-light treatment is the well-known "Anatomy Lecture" (1632, The Hague). It represents the anatomist Nicholas Tulp, who ordered the picture, making a post-mortem examination before a group of his associates. The heads are wonderfully expressive, and the dead body is treated in a manner at once realistic and delicate. On a still larger scale is his masterpiece of the second period, formerly in the town hall and now in the Rijks-Museum. It is not, however, a "Night Watch," by which title it is generally known, but a portion of the civic guard issuing forth in broad daylight. His third masterpiece, "De Stallmeesters" (1662), "The Syndics" of the Clothiers' Guild, in the same museum, unites all the excellences of his style in the more sombre coloring of his last period.

Rembrandt's religious subjects, depicted in the picturesque Oriental costumes of the Ghetto, are characterized by high dramatic power and by deep religious feeling of that homely kind typical of the Dutch Calvinistic church. Among the principal examples are the "Simeon in the Temple" (1631, The Hague); the "Descent from the Cross" (1633, Munich); the "Samson" series at Berlin, Dresden, and elsewhere; the "Angel Leaving Tobias" (1637, Louvre); "Reconciliation of David and Absalom" (1642, St. Petersburg); "The Pilgrims at Emmaus" (1648, Louvre); "Jacob Blessing his Grandsons" (1656, Cassel); "David and Saul" (The Hague); "Return of the Prodigal Son" (St. Petersburg). His mythological pictures make no endeavor to attain classic form or beauty, but strive for purely pictorial effects, some of them, like the "Rape of Ganymede" (Dresden), even burlesquing the subjects. Well-known examples are "Diana and Endymion" (Liechtenstein Gallery, Vienna); the "Rape of Proserpina" (Berlin); "Danaë" (St. Petersburg). The landscapes which Rembrandt painted display the same poetic feeling and technical skill as his figure subjects; he is a consummate master of atmospheric effects under light and shadow. The best-known example is "The Mill," in the Widener collection, Philadelphia; others are at Brunswick, Cassel, Dublin, etc. Equally skillful and important are his few representations of still life, of which the best-known example is the "Carcass of Beef" (Louvre and Johnson collection, Philadelphia). Rembrandt is richly represented in the United States, both in public and in private collections. The Metropolitan Museum, New York, possesses 18 examples, acquired mostly with the Altman collection and including the celebrated "Old Woman Cutting her Nails," "Lady with a Pink," "The Auctioneer," the "Old Woman in an Arm-

chair," and several portraits, among them one of the artist and Hendrickje Stoffels. In the Art Institute, Chicago, is the well-known "Girl at a Window," and there are portraits in the New York Historical Society and the Toledo Art Institute. Among the many examples in private possession are: 10 in the Widener collection, Philadelphia; "Nicholas Ruts" and the portrait of a young artist in the J. P. Morgan collection; "The Standard Bearer" (George J. Gould, New York); "The Noble Slav" (W. K. Vanderbilt, New York); "The Gilder," Herman Doomer, and others (Havemeyer collection, New York); and portraits in the Frick collection, New York.

Rembrandt was probably the most consummate etcher of all times, and held his rank on purely technical as well as artistic grounds. Among his best-known prints are the "Descent from the Cross" (1637); "Christ Healing the Sick"; "Christ Preaching"; "Burgomaster Jan Six"; and the well-known "Landscape with Three Trees." Examples of his prints, as well as of his admirable drawings, may be found in the Louvre, Albertina (Vienna), and British Museum, in the museums of Berlin, Dresden, Munich, Holland, and in many private collections. A great exhibition of Rembrandt's works was held in Amsterdam in 1906 to commemorate the three hundredth anniversary of the painter's birth.

Bibliography. The principal authority on Rembrandt is Wilhelm Bode, whose *Œuvre de Rembrandt* (8 vols., Paris, 1897) contains reproductions of all Rembrandt's paintings; with Valentiner he wrote an interesting life of the painter (Berlin, 1909). Consult also: A. A. P. C. Blanc, *L'Œuvre complet de Rembrandt, décrit et commenté* (2 vols., Paris, 1859–61); Carel Vosmaer, *Rembrandt: sa vie et ses œuvres* (2d ed., ib., 1877); *Masters in Art*, vol. i (Boston, 1900); Malcolm Bell, *Rembrandt van Rijn*, in "Great Masters in Painting and Sculpture" (London, 1901); John La Farge, in *Great Masters* (New York, 1903); P. G. Hamerton, *Etchings of Rembrandt* (London, 1904); F. E. Michel, *Rembrandt Harmensz van Rijn: A Memorial of his Tercentenary* (New York, 1907); Adolf Rosenberg, in *Klassiker der Kunst* (Stuttgart, 1907); Kenyon Cox, in *Painters and Sculptors* (New York, 1907); T. L. Hare, *Three Great Portrait Painters* (ib., 1909); C. J. Holmes, *Notes on the Art of Rembrandt* (London, 1911). For the historic sources of Rembrandt's life, consult C. Hofstede de Groot, *Die Urkunden über Rembrandt* (The Hague, 1906). The best and most scholarly work on Rembrandt's etchings is by Rovinski (3 vols., St. Petersburg, 1890).

REMEDIOS, rā-mā'thē-ōs, or SAN JUAN DE LOS REMEDIOS. A town in the Province of Santa Clara, Cuba. It is situated 30 miles northeast of Santa Clara and 5 miles from the port of Caibarién, with which it is connected by rail, as it is with all the important towns of the island (Map: Cuba, F 4). Pop., 1899, 6633; 1907, 6988.

REMEDY (from Lat. *remedium*, cure, from *re-*, back again, anew + *mederi*, Av. *mad*, to heal). In law, the means by which the violation or invasion of a legal right is either prevented, redressed, or compensated. The term in fact is the correlative of the term "legal right," there being in general no right without a corresponding remedy for its violation. The term "remedy," however, does not include punishment, and therefore has no application in the criminal law.

The various forms of remedy afforded by the law may be classified as: (1) remedy by act of the injured party, or self-help; (2) remedy by operation of law; (3) remedy by action or suit.

1. Remedy by the act of the injured party includes all those rights conferred by law on private persons to protect themselves or their property from injury, and in certain cases to redress wrongs done, without recourse to legal proceedings. In general, remedy by act of the party, or self-help, is permitted by law whenever the remedy afforded by action would be less effective and when the privilege thus accorded to the individual to take the law into his own hands is not inconsistent with sound public policy. Thus, in general, one may defend his person and property from unlawful attacks provided he use no more force than is necessary to accomplish that result. (See SELF-DEFENSE.) One who has been unlawfully deprived of his property may upon fresh pursuit forcibly retake the property, but if the pursuit is not made immediately following the wrongful taking, or if the property has passed into the hands of an innocent holder, his only remedy is by action to recover the property or damages for its conversion. Other forms of remedy by act of the injured party are distress, right of entry, and abatement of a nuisance.

2. There is perhaps but a single true example of remedy by operation of law, and that is the ancient doctrine of remitter, which is of slight importance in modern practice

3. Remedy by action is the relief or redress afforded to one whose legal right has been invaded, by means of a legal proceeding carried on in a court having jurisdiction over the subject of the suit and the parties to it. See ACTION; PROCEDURE.

For the varied forms of remedies, see CHANCERY; COMMON LAW; DISTRESS; EQUITY; FORCIBLE ENTRY AND DETAINER; NUISANCE; ETC., and consult the authorities there given.

REMEDY OF LOVE, THE. 1. A poem of the sixteenth century, wrongly ascribed to Chaucer and printed in the edition of 1532. 2. A paraphrase of Ovid's *Remedy of Love* by Sir Thomas Overbury, printed in 1620.

REM'ENSNY'DER, JUNIUS BENJAMIN (1843–). An American Lutheran (General Synod) clergyman, born at Staunton, Va. He graduated at Pennsylvania College, Gettysburg, in 1861 and at Gettysburg Theological Seminary in 1865. After pastorates in Philadelphia and in Savannah, Ga., he removed in 1880 to New York, where he became minister of St. James's Lutheran Church. Dr. Remensnyder, who did much to unite the Lutheran sects, was elected president of the General Synod in 1911. His writings include: *Doom Eternal* (1880); *Luther* (1883); *Six Days of Creation* (1886); *Lutheran Manual* (1892); *The Atonement and Modern Thought* (1905); *Mysticism* (1908); *The Post-Apostolic Age and Current Religious Problems* (1909); *The Problem of Life* (1913).

REMÉNYI, rĕ'mān-yē, EDUARD (1830–98). An Hungarian violin virtuoso. He was born at Heves and studied the violin under Joseph Böhm at the Vienna Conservatory, 1842–45. He took part in the insurrection against Austria in 1848 and fled from Hungary. He came to the United States in 1849, but in 1853 went to Weimar, and thence to England, where he was appointed solo violinist to Queen Victoria. In 1860 he was pardoned by the Austrian govern-

ment and returned to Hungary. He afterward traveled all over the world. As a technician he was equaled by few, and had his style been free from certain idiosyncrasies and exaggerations he might have won a place among the world's greatest violinists. Consult Kelly and Upton, *Edouard Reményi* (Chicago, 1906).

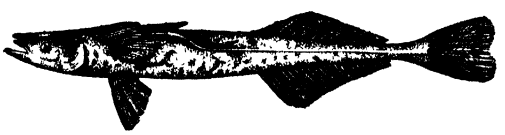
RE'MI. A powerful people of Belgic Gaul, allied with Cæsar in his campaign of 57 B.C. Their capital became the modern Rheims (q.v.). Consult Cæsar, *De Bello Gallico*, book ii.

REMI, REMIGIUS, SAINT. See REMY.

REM'INGTON, FREDERIC (1861–1909). An American illustrator, painter, and author. He was born at Canton, N. Y., studied at the Yale Art School and at the Art Students' League, New York, but was mainly self-taught. After working in a store he went to the West and became a cow-puncher on a ranch, absorbing the spirit of the life around him, which he faithfully recorded on his return to New York, first in illustrations for Western tales, then in paintings and sculpture. Whatever his medium, he was preeminently an illustrator—original, dashing, sincere, and vehemently realistic. Among the paintings of this "pioneer in distinctive American art" are "Cavalry Charge on the Southern Plains" (Metropolitan Museum, New York) and "The Emigrants." His bronzes include the statuette groups "Broncho Buster" and "Wounded Bunkie" (Metropolitan Museum). He was an associate National Academician and author and illustrator of *Pony Tracks* (1895), *Crooked Trails* (1898), *The Way of an Indian* (1906), and other tales.

REMINGTON, JOSEPH PRICE (1847–). An American pharmacologist, born in Philadelphia and a graduate (1866) of the Philadelphia College of Pharmacy, in which he became professor of pharmacy (1874), director of the laboratory (1877), and dean (1893). He was a member of the commission on revision of the *United States Pharmacopœia* for 1880, 1890, 1900, and 1910, being elected chairman in 1901. In 1893 he served as president of the first International Pharmaceutical Congress, held in Chicago. Untiring in his efforts to elevate his profession, Remington did much to establish a standard for drugs and chemicals. His best-known work is *Practice of Pharmacy* (1886; 5th ed., 1907). With others he edited the *United States Dispensatory* (1885; 19th revision, 1909).

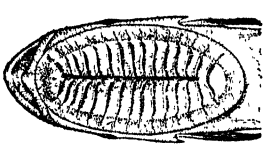
REMINGTON, PHILO (1816–89). An American manufacturer and inventor, born at Litchfield, N. Y. He studied at the Cazenovia Seminary and then entered his father's arms factory at Ilion, N. Y. During the Civil War the Remingtons supplied small arms to the Federal government, and at its close they formed a corporation under the title E. Remington and Sons. Soon afterward they began to manufacture the breech-loading rifle named after them. In 1873 the firm secured the right to one of the first typewriters, but subsequently the manufacture both of typewriters and of rifles came under the control of large stock companies, the name Remington being retained.



REMIREMONT, *re-mēr'môN'*. A town in the Department of Vosges, France, on the left bank of the Moselle (Map: France, N., M 5). The residence building of the old abbey has been rebuilt and is now used as the hôtel de ville. There is a trade in Vosges cheese. Cotton goods, embroideries, and ironware are manufactured. Pop., 1901, 10,322; 1911, 10,548.

REMITTENT FEVER (from Lat. *remittens*, pres. p. of *remittere*, to send back, from *re-*, back again, anew + *mittere*, to send). A severe form of malarial fever characterized by a regular lowering of the temperature, which, however, always remains above the normal point. In this respect it differs from intermittent malaria, in which there is an interval of entire absence of fever (apyrexia), and from the continuous variety, in which the body heat remains continuously elevated. The severer forms of remittent fever prevail in the Southern States and in tropical countries. They are found in southern Asia, western Africa, Central America, and the West Indies. A milder type of remittent fever is seen in temperate climates, especially in the late summer and fall. The treatment of remittent fever is the same as that of other forms of malarial fever. Quinine in proportional doses according to severity acts as a specific. Tonics must also be given and attention paid to the general health. See INTERMITTENT FEVER; MALARIA.

REMMIUS PALÆMON, QUINTUS. See PALÆMON, Q. R



REMONSTRANTS. See ARMINIANISM.

REM'ORA (Neo-Lat., from Lat. *remora*, delay, from *re-*, back again, anew + *mora*, delay), or SUCKING FISH. A fish of the family Echeneididæ, interesting because of its commensal habits. The remoras attach themselves to sharks and other large fishes by a sucking disk on the top of the head. They have an elongated body, covered with very small scales; one soft-rayed

WEST INDIAN REMORA (*Rhombochirus osteochir*).

dorsal fin, situated above the anal fin; the head flattened and covered with an elongated disk extending back beyond it, which exhibits numerous transverse cartilaginous laminæ directed backward and has a free flexible broad margin. These laminæ are formed by modification of the spinous processes of a first dorsal fin, and when they are raised, after the margin of the disk has been closely applied to a smooth surface, a vacuum is created; and so powerful is this apparatus that great weights may be dragged by a remora, while it obstinately refuses to let go its hold. A remora thus attached to a shark or turtle may be carried about for weeks, leaving its host only to secure food, injuring the shark in no way save, perhaps, by the slight check its presence gives to the shark's speed in swimming.

SUCKING DISK OF A REMORA.

In Madagascar native turtle catchers put a ring about the narrow caudal end of the remora's body, attach a line to this ring, and thus use the fish for catching turtles. Several species of the family are known, dwelling in all the warmer seas. They are mostly small fishes, 1 or 2 feet in length, and of plain colors or striped lengthwise in brown and white. One (*Remora brachyptera*) is occasionally caught as far north as Cape Cod. A rarer form is *Rhombochirus os-*

teoohir, which attaches itself to spearfishes (*Tetrapturus*). More numerous is the closely related species called shark sucker (*Echeneis naucrates*). (See SHARK SUCKER.) Consult Jordan and Evermann, *Fishes of North and Middle America* (Washington, 1898).

REMPHAN, rĕm'făn. A word which occurs in Acts vii. 43 in a passage quoted from the Greek text of Amos v. 26. In Amos the reading is Chiun, which is evidently intended either as the name of a heathen deity or as a symbol of idolatrous worship and is generally explained as the Babylonian name of the planet Saturn. See CHIUN

REMSCHEID, rĕm'shīt. A city in the Rhine Province, Prussia, 19 miles northeast of Cologne (Map: Germany, B 3). It has several fine technical schools. Remscheid's manufactures are mainly small steel and iron wares (tools, scythes, skates, etc.), in which industry it ranks first in Germany. There are also machine shops, rolling mills, and manufactures of silk ribbons. Remscheid is first mentioned in 1132. Its industries were stimulated by Protestant refugees from Holland and France. Pop., 1900, 58,108; 1910, 72,176.

REMSEN, rĕm'sen, IRA (1846–). An American chemist and educator, born in New York City. He graduated from the College of the City of New York in 1865, from the College of Physicians and Surgeons, New York, in 1867, and received the degree of Ph.D. at Göttingen in 1870. From 1870 to 1872 he was assistant in chemistry at the universities of Tübingen, Munich, and Göttingen, and from 1872 to 1876 professor of chemistry and physics in Williams College. At Johns Hopkins he served as professor of chemistry (1876–1913), director of the chemistry laboratory (1876–1908), and president of the university (1901–12). Dr Remsen carried out a number of important investigations in both inorganic and organic chemistry. Among his contributions to this science the best known is his discovery of saccharin (q.v.). The *American Chemical Journal*, which he founded in 1879 and edited, was subsequently merged with the *Journal of the American Chemical Society*. Dr. Remsen served as president of the American Association for the Advancement of Science (1902), the American Chemical Society (1902), the Society of Chemical Industry (1910–11), and the National Academy of Sciences (1907–13). In addition he was honored by scientific bodies abroad. His writings include: *Principles of Theoretical Chemistry* (1876); *Introduction to the Study of the Compounds of Carbon, or Organic Chemistry* (1885); *Introduction to the Study of Chemistry* (1887); *Elements of Chemistry* (1888); *Inorganic Chemistry* (1889); *A Laboratory Manual* (1889); *Chemical Experiments* (1895). Most of these passed through numerous editions and were republished in England. In 1915 appeared *The University Movement*.

RE'MUS. The brother of Romulus (q.v.) and founder with him of Rome.

REMUS, UNCLE. A character introduced by Joel Chandler Harris (q.v.) in *Uncle Remus, his Songs and his Sayings* (1880), and in other stories. He is an old plantation darky, who entertains the son of his mistress with quaint stories of the doings of Brer Fox, Brer Rabbit, and other animals.

RÉMUSAT, rā'mu'zā', CHARLES FRANÇOIS MARIE, COUNT DE (1797–1875). A French politician and philosophic historian, born March 14, 1797, in Paris. He was the son of Claire Elisabeth Jeanne Rémusat (q.v.). Rémusat studied with brilliant success, and in 1818 began his career as a journalist and supporter of Guizot. He contributed constantly to *Le Globe* from its establishment in 1824. From 1830 to 1848 he was deputy, and for brief periods Undersecretary of State (1836) and Minister of the Interior (1840). After the revolution of February, 1848, he was elected to the Constituent and Legislative Assemblies, and became an opponent of Louis Napoleon, by whom he was exiled after the coup d'état. He was amnestied in 1859 and devoted himself to literature and science. From 1871 to 1873 he was Minister of Foreign Affairs. The most noteworthy of his writings are: *Essais de philosophie* (1842); *Abélard* (1845); *Passé et présent* (1847); *L'Angleterre au XVIII siècle* (1856); *Bacon* (1858); *Hartley* (1874); *Histoire de la philosophie en Angleterre depuis Bacon jusqu'à Locke* (1875). After his death were published six volumes of *Correspondance pendant les premières années de la Restauration* (1883–90).

RÉMUSAT, CLAIRE ELISABETH JEANNE GRAVIER DE VERGENNES, COUNTESS DE (1780–1821). A writer of memoirs, born in Paris. She was a grandniece of Vergennes, Prime Minister under Louis XVI, a noted beauty of the court of Napoleon I, and an intimate friend of Josephine. As wife of Count Augustin Laurent de Rémusat, chamberlain of Napoleon, and as *dame de palais*, she was acquainted with the intimate life of the Napoleonic court, of which she left an account in her *Mémoires* published in 1879. She was also the author of an *Essai sur l'éducation des femmes* (1824).

RÉMUSAT, JEAN PIERRE ABEL (1788–1832). A French Orientalist, born in Paris, the son of a surgeon. His father taught him Latin, which he wrote and spoke with great ease. He took up Chinese and unaided brought out in 1811 his *Essai sur la langue et la littérature chinoises*. He received his degree as a physician at 25 and served in the military hospitals. A chair of Chinese having been established at the Collège de France in 1814, Rémusat was appointed to it. He was made a member of the Academy in 1816 and in 1818 succeeded Visconti as editor of the *Journal des Savants*. He was one of the principal founders of the Société Asiatique of Paris in 1822 and was long its secretary. He translated and wrote a good deal, many of his shorter productions appearing in the *Moniteur* and other periodicals, as well as in the *Journal* of the Asiatic Society. He died of cholera in Paris. His principal works are: *Livre des récompenses et des peines* (the Chinese *Kanying-pien*), with notes and illustrations (Paris, 1816); *L'Invariable milieu* of Tsz'-tse (1817); *Description du royaume de Camboge* (1819); *Histoire de la ville de Khotan*, to which is appended a treatise in which he endeavors to show that jade is the jasper of the ancients (1820); *Eléments de la grammaire chinoise* (1822); *Mémoire sur la vie et les opinions de Lao-tse* (1823); *Mélanges asiatiques* (1825); *Iu-Kiao-li* (The Two Cousins) (1826); *Recherches sur les langues tartares* (1829); *Nouveaux mélanges asiatiques* (1829); *Foĕ Kouĕ Ki, ou relations des royaumes bouddiques* (a translation of the travels of the Buddhist pilgrim Fa-hien, unfinished at the time of his death, but revised, completed, and supplemented

by Klaproth and Landresse and brought out in 1836). Consult Silvestre de Sacy, *Notice sur la vie et les ouvrages de Rémusat* (Paris, 1834).

REMY, rā'mī, ALFRED (1870–). An American philologist and writer on music. He was born at Elberfeld, Germany, but early came to the United States, where he graduated from the College of the City of New York (1890) and from Columbia (A.M., 1905). He studied the theory of music and piano under B. O. Klein in 1890-96, and was musical critic of *Vogue* (1895–97), musical editor of the *Looker-On* (1895-97), professor in the International Conservatory, New York (1895–97), and lecturer in the New York College of Music (1896–98). He also taught languages in several schools, and after 1906 was an extension lecturer for Columbia. For the second edition of the NEW INTERNATIONAL ENCYCLOPÆDIA he had charge of the department of music. His publications include *Alarcón's Novelas Cortas Escogidas* (1905) and *Spanish Prose Composition* (1908).

RÉMY, rā'mē', DANIEL DE. See COURCELLE, SIFUR DE.

REMY, re-mē', **REMI**, or **REMIGIUS**, rē-mij'ī-ŭs, SAINT. 1. Apostle of the Franks (437–c.533). He was born of noble family at Leôn. He was appointed in 459, against his will, to the bishopric of Rheims, and his episcopate is memorable for the conversion of Clovis, who was baptized by Remy on Dec 24, 496. Remy lived to see Gaul almost entirely Christianized, and died in 532 or 533. Some of his letters are preserved in Migne, *Patrologia Latina*, lxv, as also two documents under the title of *Testamenta*, the genuineness of which has been disputed. His day is October 1. Consult his *Life*, by Aubert (Paris, 1849), D'Avenay (Lille, 1896), and Carlier (Tours, 1896). 2. An Archbishop of Lyons (853–875), who sided with Gottschalk (q.v.) and whose works are in Migne, *Patrologia Latina*, cxxi. 3. A Benedictine monk, head of the episcopal school at Rheims (882–908), whose works, which are commentaries and an allegorical interpretation of the mass, are in Migne, *Patrologia Latina*, cxxxi.

RENAISSANCE, rĕn'ĕ-sans' *or* rĕ-nā'sans; *Fr. pron* re-nâ'sänss' (Fr., new birth, from Lat. *renascens*, pres. p. of *renasci*, to be born again), or REVIVAL OF LEARNING. A name usually applied to the transition from mediæval to modern methods of study and thought, the mediæval method being that of subjection to authority, to absolutism in church and state, which were one, to the end that, through obedience to the powers external to himself but representing God, man might be saved. The scholastic discipline of this period had sharpened men's critical sense, and political events in which the representatives of the Church were involved clamored for criticism. An awakening historical sense, stimulated by the influx on western Europe, both before and after the capture of Constantinople in 1453 by the Turks, of Eastern scholars with their somewhat different culture and of manuscripts, began to weigh the claims of universal monarchy and indivisible Christendom. Meanwhile the European mind, which had lain under the spell of the philosophy of realism, with its indifference to the phenomena of everyday experience and its contempt for the individual as compared with the authority of traditional institutions, encountered a new philosophy, that of nominalism, which had found expression in the Englishman William of Occam in the first half of the fourteenth century and later became a vital force in the political theories of Marsiglio of Padua. The essence of this new way of looking at things is the importance of the individual, his right to think and organize as may seem best to him. Hence new theories of church and state, as expressions of the newly dignified individual, became permissible. In religious affairs we see the application of this principle in the fearless criticism of the prevailing conditions by Wiclif in England, Huss in Bohemia, and all their sympathizers, organized or not, throughout Europe. This central idea is that the most important fact of Christianity is the membership of the individual Christian in a community of which Christ alone is the head, consequently organized forms of human authority in religion are nonessential and may be totally wrong The only necessary authority is that of Scripture, and the inevitable result of this is the right of individual interpretation with all its consequences. From Wiclif on through the whole period of the Reformation the Bible is the common source of appeal for the most diverse forms of opposition to the Roman system

Parallel with this development in religion is the intellectual process we call the revival of learning. Wiclif's Italian contemporary, Petrarca, subjected to a sweeping criticism all the existing forms of the science of his day: the scholastic philosophy, the science of astrology, the study of the law and of medicine, the practice of teaching. To this mass of tradition Petrarca opposed the principle of individual study and observation. Yet he too, like the religious reformers, must have his authority, and he found it in the classic literature. The ancients stood to him for types of a higher manhood, with larger, freer, and truer conceptions of life. They seemed to him free from the superstitious slavery to traditions which he saw around him. His own struggling individualism found its justification in what he imagined to be the perfected individualism of the ancient world. His own poetic gift found its chief satisfaction in the poetic charm of ancient literature; even the prose of Cicero seemed to him to have a wonderful rhythm long before he could understand it. Then, precisely as the religious reformers insisted that the Bible should be studied without restraint of doctrine or tradition and made use of the printing press to offer it, in vernacular translations, to the people, so Petrarca found his chief mission in collecting, collating, copying, and publishing the texts of the classical authors. Still further, as the translations of Wiclif and others were made, not from the original tongues, but from the imperfect Latin authorized version (Vulgate), so Petrarca had to be content with Latin versions of the Greek authors. In both cases the authority they reverenced came to men in an imperfect form, but in both the spirit of a new time is perfectly evident. Wiclif is the first apostle of the Protestant Reformation, and Petrarca is the first great teacher of the revival of learning.

Petrarca, a champion of scientific method, was also, after Dante, the chief creator of the modern Italian language. The literary use of the modern tongues, the natural utterance of the free layman, is, equally with the more sympathetic study of the ancient world, an

element in the great reaction against a purely clerical and Latinized culture. This double intellectual life of Petrarca is shared by all his humanistic contemporaries and immediate followers. Giovanni Boccaccio is known to posterity chiefly through his Italian prose tales, but his own special pride was in the service he rendered to classical learning by his laborious encyclopædic works—the *Genealogy of the Gods*, a dictionary of mythology, and his *Dictionary of Classical Geography*. These books served as a groundwork of classical studies for the youth of two centuries to come. Boccaccio died as professor of the *Divine Comedy* at the University of Florence, another illustration of the equality of the modern and ancient literatures in the estimation of Renaissance Italy.

Petrarca applied to learning for the first time what we have learned to call the collector's instinct. Much of the classic literature was already known, but until Petrarca no one had thought of searching for more. Through his widely extended personal relations in all the countries of Europe he was able to employ willing hands to bring the long-forgotten manuscripts out of their hiding places, to have them sent to him, procure copies of them, compare these with the originals, and thus learn wherein they needed correction. Many indications in already known writings pointed to others not yet discovered and thus made possible intelligent search after these lost treasures. All this work was carried on by Petrarca and his contemporaries with the fresh enthusiasm that belongs only to an interest freed from any professional quality, but it soon became the serious pursuit of men who gave their lives to it and thus laid the foundations for a new profession, unknown to the Middle Ages, the profession of the scholar, pure and simple. These men were devoted to learning for its own sake and ready to leave to others its application to practical things.

The same passion of discovery appears also in the field of archæology. The Middle Ages had pitilessly despoiled the remains of ancient buildings to gain material for their own constructions and had destroyed without scruple the choicest works of antique sculpture Now, following the indications of what remained above ground, Petrarca and his followers began to seek for what was hidden. They gave the first feeble impulse to the vast activities of modern research. To them we owe the beginnings of both the libraries and the museums of modern Europe.

In the generation following Petrarca the influence of the New Learning makes itself widely felt in many forms of activity. Men whose early training had been chiefly as scholars came to be sought for services of every kind. Coluccio Salutato, one of Petrarca's most ardent admirers and imitators, spent his life as secretary of the Republic of Florence, at a time when the little state was involved in the most complicated relations with all the powers of Europe. It was his duty to write the elaborate Latin essays which were then the chief medium of diplomacy, and his fame rests upon the elegance and purity of this imitated classicism. Poggio Bracciolini filled for life a similar place in the papal chancery, and was no less approved and applauded because his caustic humor reveled in ribald obscenities. Niccolò Niccoli was the business centre of the Florentine group of scholars, the earliest type of the modern book collector and publisher. Ambrogio Traversari, general of the Order of Camaldoli, devoted much time to studying and editing the works of the ancients. Francesco Filelfo was the earliest specimen of the haughty pedant, learned beyond others in all the detail of scholarship but without the creative power that had marked the pioneers. He touched the schoolmasterly stage of the revival when the work of discovery had largely been done and when the chief distinction of the scholar was to be gained by a kind of technical skill quite independent of any largeness of mental equipment.

It is at this stage that we begin to see the results of the great expansion of interest due to the study of Greek. Petrarca had deeply felt the importance of this study and had bemoaned his incapacity to engage in it. Greek was still a living tongue in parts of southern Italy, and communication with the East was frequent enough, but Boccaccio, who seems really to have made the effort, found it impossible to procure suitable instruction. The men of the next generation, however, set themselves more earnestly to work; Greek teachers began to hear of the golden opportunities in the rich Italian towns, and Italian youths sought instruction at the ancient school of Athens. The earliest and most influential of these Greek teachers was Manuel Chrysoloras (died 1415), a man of distinction in the public service at Constantinople, brought over to Italy by his duties in this capacity and then employed as teacher of Greek at Florence. Another Greek of later influence was John Argyropulos (died c.1489), who was successively rector of Padua and professor at Florence and finally at Rome. Of Italians who illustrated the highest application of ancient culture to the development both of Italian literature and the perfection of classic learning, we may mention Guarino (died 1460), the teacher of Lionello d'Este, Poliziano (died 1494), who instructed Pietro de' Medici, and Lorenzo de' Medici (died 1492).

Circumstances favored a rapid spread of the new culture. The Italian cities, grown rich under democracy, but somewhat tired of its responsibilities, had been passing into the control of that extraordinary series of despotic rulers who united with a brutal unscrupulousness of character a taste for the best in literature and art without a parallel. It was one of the chief claims to power for a new-made tyrant like Cosimo de' Medici that he provided the means of existence for talent of every sort. Even the bloody ruffians who one after another held power in Milan made places for scholars and artists, maintained libraries, and encouraged learned research. The ancient universities of Bologna, Padua, and Salerno were reinvigorated by the healthful breath of the New Learning and stimulated by the rivalry of the new schools founded by the younger republics. The papacy, with a free hand after the Council of Basel (1431–49), passed into the control of a series of men like Nicholas V, Pius II, and Leo X, in whom the interest in learning and art was an absorbing passion. Under these favoring conditions a certain flippancy of character came to be associated with the cleverness of the fifteenth-century scholars. Without formally renouncing their allegiance to Christianity, many felt the desire to reproduce in themselves the content of mind of their beloved Greek philoso-

phers and were as openly antagonistic as was politic to the usurper Christianity. While paganism had by no means disappeared during the Middle Ages, its survivals and outbreaks had been either unconscious or accompanied by a sense of guilt. But now paganism found itself about to be reinstated as of more ancient right and therefore nobler birth than its rival. It is at this point that the counter-reformation strikes at both the Reformation in the North and the Church's enemies near at home. The Council of Trent assembles in 1545 and Dolet is burned in Paris in 1546. Bartholomew, Smithfield, autos-da-fé, Alva's treatment of the Netherlands, the burning of Bruno in Rome, are so many attempts to crush the rebirth of man's spiritual independence, which had manifested itself most clearly in the reformulation of religious belief; its political expression, checked in Italy by the act of Charles V in placing the peninsula under a Spanish hegemony, was destined to be suppressed by the hostile forces of church and state for over two centuries. It is in art, therefore, that the Renaissance can be said to have had its first and most complete expression, in art nourished by the treasures of antiquity rediscovered and revalued by the humanists. The wonders of the cinquecento are most numerous in Italy, but France had her Rabelais, Spain her Cervantes, and England her Shakespeare.

A change came over the spirit of the New Learning when it passed to the more serious, less artistic, and more deeply religious peoples of the North. The impulse which led young Germans and especially young Englishmen to cross the Alps and study the ancient classics under Italian teachers was largely the desire to find the very best means to acquire such training as would help them in the professions. There is in the North little of the affected æstheticism of the later Italians. Such men as those whom Erasmus found in England at the end of the fifteenth century—John Colet, later dean of St. Paul's, founder of the most important boys' school in England and interpreter of Christianity by the method of a rational criticism; Grocyn, the most important agent in introducing the teaching of Greek into England; Thomas Linacre, founder of the London College of Physicians; and Thomas More, a busy lawyer, king's counselor, and social reformer—suggest a type of man totally different from the members of the Florentine Academy. Yet all these men drew their intellectual inspiration from Italy and were free to acknowledge their debt. Erasmus himself, with all his biting satire and his ready criticism of many serious things, was primarily the preacher of a sane rationalism based upon sound learning, and by this he always meant the learning of the New Method. One of the services of the northern humanism was the revival of the study of Hebrew on a scientific basis. What we have said of the mediæval study of Latin applies equally to that of Hebrew. It had been pursued by Jewish scholars with a view to the perpetuation of their racial institutions, but it had not been in any sense an instrument of culture. Johann Reuchlin, an elder contemporary of Luther and Erasmus, was the first to call attention to the importance of Hebrew in a complete scheme of Christian scholarship. He aroused a storm of opposition from the same obscurantist elements that had always been ready to persecute Jews as inevitably hostile to all that bore the Christian name. He found his support wholly in the circle of enlightenment that had spread itself outward from the study of the Greek and Latin classics as a means of civilization. The best expression of this incident in the struggle is found in the *Epistolæ Obscurorum Virorum* (q.v.) (Letters of the Men of Darkness), a galling satire of the Reformation period, in which the old scholastic method was held up to derision.

The first quarter of the sixteenth century saw the capture of most of the great universities of the North by the new spirit. At Paris the Sorbonne still defended the ancient faith by the ancient methods, but the Collège de France, founded by Francis I, became a seat of enlightened instruction. At Louvain, one of the most solid bulwarks of the scholastic theology, a new school was established with the help of Erasmus.

That the New Learning had its effect on the Protestant Reformation is further shown by the studies of Luther, Calvin, Zwingli, and other leaders of the movement.

The Renaissance may be defined as a period of increased activity of men's powers, due to the breaking down of those forces which had kept them in leash. This activity displayed itself most characteristically in the revival of learning, which gave the Reformation its tools. See HUMANISM.

RENAISSANCE ARCHITECTURE. See RENAISSANCE ART, *Architecture*.

RENAISSANCE ART. In the last decades of the fourteenth century and the first decades of the fifteenth a new spirit invaded art, asserting itself in a new enthusiasm for the study of man and the study of the antique. To the humanists in literature corresponded the realists, naturalists, and classicists in art. Antique art was rediscovered, but while the classical element preponderated in architecture and decoration, the element of realism was, until the advent of the High Renaissance, more important in sculpture and dominated painting. The flowering of the Renaissance into these new impulses was chiefly due to a few leading artists of Tuscany between 1390 and 1430, to the architect Brunelleschi, the sculptors Donatello, Quercia, and Ghiberti, and the painters Masolino, Masaccio, and others. Northern critics, however, have shown that a strongly realistic school had previously developed in Burgundy, northern France, and Flanders, especially in the sculpture of such artists as Claux Sluter, Beauneveu, and Jean de Cambrai. The age of the Renaissance, though it practically closes before 1600, was not superseded by a Græco-classical revival until the period immediately preceding the French Revolution.

Painting was the typical art of the Renaissance, because it best expressed its realism. In architecture the style was far less original, its character being less constructive than decorative. The preponderance of the secular spirit led to a decadence of religious art in all forms. The previous tendency towards general types in art gave way before a new individualistic tendency, each artist creating his own personal style. In architecture to a considerable extent, but more decidedly in painting, the peculiarities of local schools became very prominent.

Tuscany was followed by Lombardy in the development of the Renaissance about 1460, and shortly afterward by Venice. Rome and Naples were simply meeting places for Tuscan and Lombard artists. France was the first foreign country to follow the example of Italy, with whom its relations of all kinds had long been of the closest. Spain, in some parts, then followed quite early in the sixteenth century. Not till the middle of the century did Germany and England accept the new style to any large extent, and even then with less of pure beauty and less appreciation of the classic spirit than in Italy and France.

Renaissance sculpture and painting are of such importance in the history of the general development of these arts that it is most convenient to treat them under the general articles.

Architecture. *Italy.*—Gothic architecture had never acquired a deep-rooted hold in Italy and Italian architects had been seeking for a new style ever since the decline of the Romanesque. The inspiration for this they found in a study of the Roman ruins, whose details supplied them with suggestions for new forms of architectural expression in which, as in most Italian work of all periods, the decorative idea predominated over the structural. The style thus developed was more successful in secular than in religious buildings. Coming at a time of individualism, it developed personal and local phases of style, and its history is the history of the works of individuals, not of a national style. Several periods of Italian Renaissance can be distinguished: (1) early or free Renaissance, c.1420–1500, (2) high or classic Renaissance, c.1500–1580; (3) the decline or baroque, c.1580–1780. The founder of the style was the Florentine Brunelleschi, the greatest designer of the early Renaissance and equaled only by Michelangelo and Bramante among later men. In the Pazzi Chapel (1425) and the two great basilican churches of Santo Spirito and San Lorenzo he revived the moldings and details of classic architecture, but neither he nor his followers, Michelozzi and Giuliano da Majano, attempted any close imitation of Roman buildings. The two great palaces of this first period in Florence, viz., the Riccardi by Michelozzi (1430) and the Pitti (1435), though Roman in scale and in minor details, were of a thoroughly modern and Florentine type. Alberti was the first to adapt strictly Roman forms to both religious and secular architecture by the use of superposed orders, pilasters, entablatures, and Roman arches. Florentine architects of later date, Rossellino and Francesco di Giorgio, carried the new style to Pienza, Siena, and Cortona, and others, like the Majani, Laurana, and Giuliano da Sangallo, to Naples, Urbino, and Rome. The ducal palace at Urbino is one of the most imposing masterpieces of the early Renaissance. In Lombardy the new style developed a prolific school of design in brick and terra cotta, more varied and picturesque than the Florentine. Its influence was carried to Venice by the Lombards, and there gave rise to the most richly decorative of all the local Renaissance styles, through the free use of marble incrustations and surface carving. To Lombardy belongs also the most highly decorated façade of the Renaissance, that of the Certosa at Pavia (1470); and from Lombardy came Bramante (q.v.), the genius who inaugurated the Middle Renaissance, after his establishment in Rome in 1499.

While most of his predecessors had been primarily goldsmiths or decorators, Bramante was a master builder and became an architect in the true modern sense. He was the first to embody the genuine Roman spirit in modern design, as in his Tempietto and in his designs for the Vatican and St. Peter's (1503–06). Henceforth both the Lombard and early Tuscan systems of ornament were abandoned for a more severe and grandiose treatment; only in the interiors was decoration still abundant. The design that embodied its best features was Bramante's plan for St. Peter's. The Roman school under him now succeeded the Tuscan in the leadership, and the study of Vitruvius and the measuring and drawing of Roman ruins became an accepted part of every architect's training. Raphael, Peruzzi, and Antonio da San Gallo were among Bramante's foremost pupils; the Farnesina, Massimi, and Farnese palaces embody their

ideas, the last named being the most imposing in Rome. But meanwhile the Venetian school had not lost the individual charm (see VENICE) of its civic and palace architecture under Guglielmo Bergamasco and his rivals and then under the neoclassic leader Sansovino, whose Libreria di San Marco and Palazzo Cornaro (1528–32) marked an epoch in Venetian architecture.

This middle period closes with Michelangelo, whose genius, like Bramante's, also ushered in a new period, that of the scientifically developed Renaissance, based upon the deepest study of classical monuments. Remodeled by Michelangelo, St. Peter's remained even more the type for Renaissance churches. The dome, either single or grouped, the tunnel vault and cross vault, often coffered, continued the orthodox forms of covering. Internal piers became heavier, while columns often took the place of pilasters outside. The single order after the colossal example of it given at St. Peter's by Michelangelo reigned supreme. Vignola's works present this style under a more refined aspect and mark the beginning of the villa architecture of the Roman school. (See LANTE, VILLA.) In the palaces of Alessi and others at Genoa monumental staircases and vestibules are the central point for grandiose and original treatment, rather than the façades. The progressive domination of classic formulæ is observed alike in the writings and the buildings (especially at Vicenza) of Palladio (1518–80). The term Palladian is generally used for this scientific-theoretical style, whose side lights were Vignola, Serlio, and Scamozzi. Its first great embodiment in Palladio's work was the arcade around the basilica at Vicenza, which was followed by other remarkable works, such as the Palazzo Chieregati, the Palazzo Tiene, and the Teatro Olimpico. He created his highest types of religious architecture in Venice with San Giorgio Maggiore and the Redentore, and through them produced a revolution.

Hard on his footsteps came the baroque style (see BAROCCO) (c.1575–1780). It was a reaction from Palladian severity and reveled in broken lines, vagaries of proportions, and defiance of tradition. Domenico Fontana, Maderna, Bernini, and Borromini were its greatest representatives. Its masters produced sometimes a grandiose work like Bernini's colonnades of St. Peter or a logical church façade, though Maderna failed utterly in that of St. Peter's and succeeded better only in smaller buildings such as Santa Susanna. The works of Longhena (q.v.) at Venice were exceptions to the general rule of extravagance and bad taste. As in every final style of an architectural period, the picturesque predominated over the monumental. Rich colored marbles, heavy details of cupids, scroll-work, and architectural motives, even imitations in metal and marble of stuffs, as in Bernini's famous baldachin, are prominent.

France.—The close political relations of Italy with France and the habit of calling in Italian artists, consequent upon the campaigns in Italy of Charles VIII, Louis XII, and Francis I, led to the introduction of Renaissance forms into France sooner than elsewhere; at the same time the strength of French Gothic traditions not only retarded the prevalence of Renaissance forms, but led to an internal reform rather than to the adoption of an Italian style. Religious architecture had been for some time on the wane and palace architecture in the ascendant. The first indications are most evident in decoration, where Lombard models prevail. The transitional period illustrated in the Château de Gaillon and in the older part of that of Blois (q.v.) is still prevailingly mediæval; but with Francis I Gothic outlines tend to disappear and the classic orders to prevail. But it was not the foreign but the native artists to whom the fundamental changes were now due: first to the men of North France, like Fain and Viart; then to those of the royal domain, like Le Breton and Lemercier; while others, like Chambiges in his unique Château of Saint-Germain, remain outside of the Renaissance orbit even towards the middle of the sixteenth century. The greatest achievement was the transformation of the feudal castle into a superb and artistic residence, totally unlike anything known in Italy: such were Amboise, Blois (q.v.), Fontainebleau (q.v.), and especially Chambord (q.v.), with its great corner bastions and its forest of dormer windows, chimneys, and towers, a characteristic feature in which French differs so fundamentally from Italian Renaissance. These royal residences were almost rivaled by those of the nobility like Azay-le-Rideau and Chenonceaux (q.v.).

The closing years of Francis I (died 1547) usher in a more classic style. Some of its leaders, like Jean Bullant, Du Cerceau, and Philibert de l'Orme, studied in Italy; others, like Pierre Lescot, were undoubtedly familiar, through drawings, with Italian buildings. Lescot's creation of the Louvre (q.v.) (1546) is the classical example of the new style of royal palace without a trace of mediævalism and is if anything superior to the contemporary work of San Gallo, Vignola, and Sansovino in Italy. One of its great charms lies in the magnificent sculptures of Jean Goujon and others, which make it unique in its decorative scheme. De l'Orme's Tuileries (q.v.) and Château of Anet were his masterpieces. Under Francis I, Henry II, and Charles IX France was covered, especially in the region of the Loire, with châteaux of similar types, with civic structures like the town halls of Beaugency and Paris and with innumerable city houses of the nobility and bourgeoisie. The changes brought about by a further influx of Italian ideas under Maria de' Medici involved loss of charm as well as force in later works. Additions were made to the royal palaces, such as the Tuileries, the Louvre, and Fontainebleau, and a new palace, the Luxembourg (q.v.), was built by one of the leaders of the new school, Salomon de Brosse, who improved upon his Italian model, the Pitti Palace. Lemercier was very successful in his additions to the Louvre and in the Sorbonne. Through all this middle period there is a constant struggle between Italian classic and baroque tendencies and the French love of the picturesque, but French architects did not go to the extreme either of scientific frigidity or lawless eccentricity.

Under Louis XIV a more fanciful interior decoration mingled with the formal Palladian external architecture. Mansart showed in his colossal palace of Versailles the chilling effects of this formal classicism, but he achieved greater success in his dome of the Invalides. The masterpiece of the time was, however, the superb Corinthian colonnade of the east front of the Louvre, by which the palace was com-

pleted, from the designs of Perrault. The interior decorative work of this period in France has an originality and a delicacy that place it as much above contemporary work in Italy as the early decoration had been inferior. Under Louis XV Italian ideas obtained complete possession of exterior design and of church architecture both exterior and interior, though in domestic architecture the interior decoration and furniture display a remarkable fantastic originality. The Paris Pantheon by Soufflot (q.v.) represents the formal Roman classicism that prevailed in the latter part of the eighteenth century.

Germany.—Renaissance architecture made its way more slowly in Germany than elsewhere, except in England; partly, no doubt, because the movement was so largely concerned with religious questions. When the new style entered Germany it was from Carinthia, Bohemia, and Tirol rather than from Italy, and Italian architects were employed in Prague, Cracow, Gran, and Vienna long before the creation of the earliest examples of the style even in south Germany, while the northern states were still slower in receiving it. The real transformation of German architecture began after the Peace of Augsburg (1555), and is to be seen in the castles of the princes and barons, the houses of wealthy burghers, and guilds, and the Rathäuser of the town councils, rather than in royal palaces or in religious buildings. Indeed, St. Michaels, Munich, is the only really important church edifice of the sixteenth century in all Germany (1582). Until the Italian baroque style invaded Germany, late in the seventeenth century, the Germans retained unchanged many of their national and mediæval features—high roofs, vast stepped gables of fanciful outline, dormers running through two or three stories, spiral stair towers, oriels, the irregular plans of the feudal castles, and a predilection for fantastic and picturesque combinations of form and detail. The orders appear rarely except in portals or in pilasters, and then treated with utter disregard of classic canons, and court arcades of the classic type are not to be found. The style appears, therefore, at its best in the smaller street fronts of narrow houses, or the picturesque masses of castles on the hillsides, as at Torgau, or in the highly ornate Otto Heinrichsbau (1554) and Friedrichsbau (1601) of the great castle at Heidelberg, which are generally considered the masterpieces of the first period. The town halls of Altenburg, Danzig, Augsburg, Rothenburg, and Bremen (from 1562 to 1612), and others of less importance, form another interesting group of examples of the style. In the later or baroque period there were many palaces erected or enlarged, of moderate architectural interest, except in the case of the Zwinger at Dresden (1711), which is one of the finest and most consistent examples of the rococo extant; and there were also a number of interesting churches in this style (e.g., Marienkirche at Dresden). Landscape architecture after the style of Versailles was highly developed in this period.

Belgium and Holland.—In these closely related countries Renaissance architecture developed very differently, though late in both. Belgium was strongly affected by both French and Spanish influences, as in the fantastic semi-Spanish episcopal palace at Liége by Borset (1508), and produced but one monumental edifice of classic type, the Antwerp town hall (1564). As in Germany many of the most characteristic Renaissance works are guildhalls and narrow street fronts, as on the great square at Brussels, the boatmen's house at Ghent, etc. Even more successful were many sumptuous choir screens, altars, and pulpits, both in Belgium and in Holland. In the latter country the Renaissance produced almost no works of real importance, though some of the Dutch town halls are worthy of notice, as at The Hague (1565), Amsterdam (1655), and Leyden (1597). With these may be classed also the Amsterdam Bourse, and in Denmark the Exchange at Copenhagen. The use of brick, of stepped gables, and of a naïf style of design gives a certain charm to many less important Dutch buildings.

Spain.—Although the Renaissance in architecture entered Spain largely through the work of Flemish artists, it developed more rapidly and produced more important works than in Flanders. The exuberant decorative spirit of Spanish late Gothic and Moresque art appears in the elegant detail of the plateresque, as the early phase of the Renaissance in Spain is called, in such structures as the Santa Cruz Hospital at Toledo, the College at Alcalá de Henares, and the Ayuntamiento at Seville, all between 1500 and 1520. About 1525 church architecture was radically modified by the new style, as shown in the cathedrals of Jaén (1525) and Granada (1529) and San Domingo at Salamanca. But hardly had this begun when Berruguete returned from Italy and brought with him the High Renaissance in the Palladin form, which was further developed by Herrera. This second phase of Spanish Renaissance is called the Græco-Roman, and it ruled until the close of the seventeenth century. The palace of Charles V at Granada is a noble structure by Machuca and Berruguete, rusticated below, colonnaded above, of good proportions and well planned. One building especially corresponds in its vastness to the greatness and character of Spanish power, viz., the Escorial (q.v.), a huge rectangle, simple and uninteresting except in its domical church, which is an impressive edifice of classic style. In such works as these Italian ideas are reproduced with greater fidelity and absence of local national traits than in any other country. On the other hand, when under the leadership of Churriguera an extreme form of baroque or rococo pervaded Spain, the national leaning towards elaborate detail and overdecoration of surfaces ran riot as never before. Some of the royal palaces (Madrid and San Ildefonso) built in the eighteenth century escape it, but with few exceptions it prevailed.

Portugal hardly holds any independent position. Its masterpiece of the sixteenth century, the group of monuments at Belem, is the *comble* of luxuriant expression of the mixed late Gothic and pseudo-Renaissance design.

England.—Latest of all countries to employ the Renaissance style was England. Under Elizabeth and James I (1558–1625) there were sporadic examples and a sprinkling of the new style of decoration in Tudor work. There were some Italian artists, like Torrigiano and Giovanni of Padua, but they had to adapt themselves to Tudor requirements, except in a few cases such as the Caius Gate at Cambridge. Many splendid manor houses built during this reign show, however, the gradual invasion of

the classic pilaster, entablature, and arch (Longleat, Wollaton, Burghley, Montacute, etc.). Inigo Jones (1572–1652) changed the trend of architecture and led to the universal adoption of the pure Italian High Renaissance of the Palladian type before the middle of the seventeenth century, his happiest effort being the palace at Whitehall (q.v.). His work was carried forward by Wren, whose masterpiece, St. Paul's Cathedral (q.v.), is one of the great buildings of Europe. It combined the Renaissance groups of domes with the typical ground plan of an English Gothic cathedral. Wren's sobriety and consistency gave a character of good taste to all contemporary English architecture, which continued throughout the eighteenth century under the leadership of men like Van Brugh, the designer of Blenheim, Hawksmoor, and Gibbs, who built St. Martins-in-the-Fields and the Radcliffe Library, Oxford. These men and their successors, Chambers, Adams, Taylor, and Dance, show a progressive degeneration in point of originality up to the close of the century, when the wave of purely Greek Renaissance struck England and was embodied in buildings like the Bank of England (see SOANE), the British Museum (q.v.), the Fitzwilliam Museum, Cambridge, and the fine St. George's Hall, Liverpool. See EARRING; INTERIOR DECORATION; LOMBARDY, RENAISSANCE ARCHITECTURE OF; PAINTING; SCULPTURE; also Plate of FURNITURE and of TEXTILE PRINTING

RENAIX, re-nā'. A town of Belgium, in the Province of East Flanders, picturesquely situated, 24 miles by railway south of Ghent (Map: Belgium, B 4). It manufactures fine linen and damasks, woolen fabrics, tobacco, and pottery. Pop., 1900, 20,090; 1910, 22,324.

RE'NAL DISEASE. See BRIGHT'S DISEASE; CALCULUS; CIRRHOSIS.

RENAN, re-nän', ERNEST (1823–92). A French religious historian and Semitic philologist, born at Trégnier in Brittany, Feb. 27, 1823. Of his childhood he told in *Souvenirs d'enfance* (1883). He lost his father in youth and owed it to a devoted sister that he could begin with neighboring priests the studies for which his frail health seemed to designate him. He was soon summoned to Paris and promoted to Saint-Sulpice, the chief training school of the French priesthood. At 22 he abandoned his study for orders and taught Latin in a clerical school, still aided by his sister's savings, till at 25 he won his doctorate with such distinction as to assure a position that was already recognized by an academic prize for an essay *Sur les langues sémitiques*. He won a second prize in 1850 for an essay, *Sur l'étude du grec dans l'occident au moyen-âge*, was sent by the Academy to Italy, where he prepared an epoch-making work on Arab philosophy, *Averroès et l'Averroïsme* (1852), and to Syria (1860), where he found inspiration for his *Vie de Jésus* (1863), the first of seven volumes that occupied him from 1867 to 1881, dealing with the origins of Christianity to the death of Marcus Aurelius. To this he added as an introduction *L'Histoire du peuple d'Israël* (1888–94). Though elected professor of Hebrew in the Collège de France (1862), he was not allowed to lecture, because of his expressed unorthodoxy. This gave wide popularity to his ideas and allowed him more leisure to propagate his enthusiastic belief that politics, education, and ethics itself would be regenerated by the progress of science, especially of history and philology. The *Vie de Jésus* was widely translated (popular ed., New York, 1912); 300,000 copies were sold in France alone, and for every later work of Renan there was a popular as well as a scholarly demand. *Les apôtres* (1866) and *St. Paul* (1869) were followed by a volume of essays on contemporary questions (1868). Then came the Franco-German War, which evoked from Renan two remarkable letters to David Strauss, the radical biblical critic of Tübingen, showing a patriotism free from every taint of chauvinism. The Republic restored his professorship and he now published *L'Antechrist* (1873); *Les évangiles et la seconde génération chrétienne* (1877); *L'Eglise chrétienne* (1879); *Marc-Aurèle et la fin du monde antique* (1881). Volumes of essays with the titles *Etudes* (1857), *Essais* (1859), *Mélanges* (1878), *Nouvelles études* (1884), *Discours* (1887), accompanied or followed his more connected work. His *Drames philosophiques* were first collected in 1888. A vision of *L'Avenir de la science*, written in 1848, was given to the world as a sort of parting gift in 1890. During his last years Renan enjoyed all the honors, public and private, that Paris could give to a favorite scholar. He was made Grand Officer of the Legion of Honor and administrator of the Collège de France, dying as he had wished, at his post (Oct. 2, 1892). Renan saw so many sides of his subject that he was never as sure of any of them as he was of his own critical

wit. He was by turns hazy, cautious, mythical, ironic, idealistic, skeptic, all with a romantic sentiment and a rosy optimism that regarded the nineteenth as "the most amusing of centuries," to be contemplated with "benevolent and universal irony." He had a lofty conception of moral duty and held that "few persons have a right not to believe in Christianity." He knew that he himself was "a tissue of contradictions, one half fated to be employed in destroying the other," and he said this fact gave him "the keenest intellectual pleasure that man can enjoy." He typifies the skepticism of modern France, its awakening religious curiosity, its dilettante shrinking from "the horrible mania of certainty," its Protean inconsistency and its easy tolerance, born of a conviction that no faith is worth a struggle, much less a martyrdom. Of Renan's works there is no uniform edition. To the writings named above may be added many linguistic studies in the *Mémoires* of the Academy and in the *Journal Asiatique*, important contributions to the monumental *Histoire littéraire de la France* (vols. xxiv–xxx), translations of *Job* (1858), *The Song of Songs* (1860), *Ecclesiastes* (1881), and many lesser essays. The titles and dates of the *Philosophic Dramas* are *Caliban* (1878); *L'Eau de jouvence* (1880); *Le prêtre de Némi* (1885); *1802: Dialogue des morts* (1886); *L'Abbesse de Jouarre* (1887). There are English translations of the whole *Histoire du peuple d'Israel* and of the *Origines du christianisme*, of the *Etudes* and *Nouvelles études*, of *Job* and the *Song of Songs*, and of the *Souvenirs*.

Bibliography. For Renan's life and character, consult his own *Souvenirs d'enfance et de jeunesse* (Paris, 1883; new ed., Boston, 1902), his *Feuilles détachées* (ib., 1892), and *Lettres intimes* (ib., 1896); also: F. W. H. Myers, in *Essays: Modern* (London, 1883); Paul Bourget, in *Essais de psychologie contemporaine* (5th ed., Paris, 1889); G. E. Saintsbury, in *Miscellaneous Essays* (London, 1892); Henri Despartes, *Ernest Renan: sa vie et son œuvre* (Paris, 1893); Gabriel Séailles, *Ernest Renan: essai de biographie psychologique* (ib., 1894); Francis Espinasse, *Life of Ernest Renan* (London, 1895); Edouard Rod, in *Les idées morales du temps présent* (Paris, 1897); Eduard Platzhoff, *Ernst Renan: ein Lebensbild* (Dresden, 1900); H. G. A. Brauer, *Philosophy of Ernest Renan* (Madison, Wis., 1903); W. F. Barry, *Ernest Renan*, in "Literary Lives Series" (New York, 1905); Hippolyte Parigot, *Renan: l'égoisme intellectuel* (Paris, 1909); Irving Babbitt, in *The Masters of Modern French Criticism* (New York, 1912); Mariette Soman, *La formation philosophique d'Ernest Renan* (Paris, 1914); Frank Harris, in *Contemporary Portraits* (New York, 1915).

His son ARY (1858–), born in Paris, became known as a landscape and figure painter and art critic, and was a pupil of Delaunay and of Puvis de Chavannes. He began to exhibit in the Salon in 1880, contributed many critical essays to the *Gazette des Beaux-Arts*, of which he afterwards became secretary, and in 1900 published an interesting monograph on Gustave Moreau (q.v.).

RENARD, re-när', ALPHONSE FRANÇOIS (1842–1903). A Belgian mineralogist and geologist, born at Renaix. He studied theology, superintended the Collège de la Paix at Namur in 1866–69, attended the Jesuit training school at the abbey of Maria Laach, and was ordained a priest in 1877. He had also studied natural sciences at the University of Vienna, and held the chair of chemistry and geology in the Jesuit college at Louvain in 1874–82. In 1877 he was also appointed curator of geology at the Museum of Natural History of Brussels, and from 1888 until his death was professor of geology at the University of Ghent. In 1901 Abbé Renard, as he was called, renounced his priestly vows. Besides other valuable papers his studies with Sir John Murray on the results of the *Challenger* expedition to investigate deep-sea deposits are considered especially important; they were published in 1891.

RENA'TUS CARTE'SIUS. See DESCARTES, RENÉ.

RENAUDOT, re-nō'dō', THÉOPHRASTE (1586–1653). A French physician and philanthropist. He was born of a Protestant family at Loudun (Vienna), where he practiced for a short time after studying surgery in Paris. In 1605 he received the degree of doctor of medicine from the University of Montpellier. Called to Paris by Richelieu (1612) to develop a plan of assisting and helping the poor, whose number was increasing greatly in France, especially in the capital, Renaudot received the titles of physician and councilor to the King. Because of his religion and of his connection with the University of Montpellier, representing liberal ideas, as contrasted with the Jesuitical University of Paris, Renaudot met much hostility. His *bureau d'adresse* was an intelligence office, labor bureau, and charity organization combined. In 1637 he opened the first pawnshop (mont-de-piété) in Paris, on a plan taken from Italy and originally from Germany. Soon afterward he started a free dispensary for the poor and offered a free course of lectures on scientific subjects. The lectures and the dispensary aroused the ire of the orthodox medical faculty, and Guy Patin in 1640 started a campaign against Renaudot, his institution, teachings, and methods. After the death of Richelieu (1642) and of his royal master, Louis XIII (1643), Renaudot had to close his labor bureau and pawnshop, and was forbidden to practice medicine in Paris. But he was permitted to retain the editorship of the weekly *Gazette de France*, the first French newspaper, which he had started in 1631 under the protection of the cardinal. Mazarin appointed him historiographer to the King in 1646. The lectures of the years 1633–42, in which latter year they were suppressed, were published by Renaudot in 1651 as *Recueil des conférences publiques*. He also wrote biographies of the Prince de Condé, Marshal de Gassion, and Michel Mazarin.

RENAULT, re-nō', LOUIS (1843–). A French jurist, born at Autun. From 1868 to 1873 he taught Roman and commercial law at Dijon, and then went to Paris, becoming professor at the School of Political Sciences in 1874 and professor of international law at the university in 1881. He became a counselor of the French Foreign Office in 1890, was president of the Institute of International Law, and was a member of The Hague Tribunal. In 1905, with Gram, of Norway, he decided the Japanese house-tax case against Japan and in favor of Great Britain, France, and Germany. He received half the Nobel peace prize in 1907. Renault was given honorary degrees by Oxford and Christiania, and was a member of the French Institute, a fellow of the British Academy, and an honorary Knight

Grand Cross of St. Michael and St. George. He also wrote *Introduction à l'étude du droit international* (1879) and, with Lyon-Caën, *Traité de droit commercial* (1889–97). He was director of the *Archives diplomatiques* (1880–1900).

RENDALL, rĕn'dal, GERALD HENRY (1851–). An English educator, born at Harrow, where his father was assistant master. He was educated at Harrow and at Trinity College, Cambridge, of which he became fellow and where he was lecturer and assistant tutor in 1875–80. He was principal of University College, Liverpool, and Gladstone professor of Greek in 1880–97, and then was the first head master of Charterhouse School until 1911. He did valuable work on early Christian (and contemporary) authors, publishing: *Text and Commentary to Epistle of Barnabas* (1877), edited by Cunningham; *The Emperor Julian, Paganism, and Christianity* (1879), Hulsean prize essay for 1876; versions of Marcus Aurelius (1897, 1901); *Epistles to the Corinthians* (1909); *Charterhouse Sermons* (1911); *John Smith, of Harrow* (1912).

RENDSBURG, rĕnts'burk. A town in Schleswig-Holstein, Prussia, situated on the Eider and the Kaiser Wilhelm Canal, about 15 miles south of Schleswig (Map: Germany, C 1). It has a thirteenth-century church, a Gymnasium, a Realschule, and manufactures of woolens, pianos, fertilizers, meat products, leather, and artificial stone. It carries on a considerable trade in lumber and cattle. Rendsburg is first mentioned in the twelfth century. Pop., 1900, 14,757; 1910, 17,315

RENÉ, re-nā', surnamed THE GOOD (1409–80) Count of Provence, Duke of Anjou and Lorraine, and titular King of Naples. He was born at Angers, Jan. 16, 1409, being the second son of Louis II of Anjou and Provence. He married Isabella of Lorraine and claimed the succession to the Duchy of Lorraine in 1431, after the death of his father-in-law, Duke Charles. Being opposed by another claimant, the Count of Vaudemont, René was defeated and taken prisoner, remaining a captive for several years. In 1434 he inherited Provence and Anjou on the death of his brother, Louis III. In 1437 he purchased his liberty and the possession of Lorraine by the payment of an immense sum. He now led an army into Italy to secure the Kingdom of Naples, the title to the succession to which had been left to him by Louis III, who had been adopted as her successor by Queen Joanna II, by whom René had been declared heir on the death of his brother. (See JOANNA II.) He had a powerful rival in Alfonso V (q.v.), King of Aragon, who succeeded in capturing Naples in 1442 René abandoned the Kingdom and returned to Provence, where his court at Aix became a famous resort for artists and poets. He sought to revive the poetry of old Provence, and his devotion to the forms of a rapidly disappearing chivalry gained him the name of the last of the troubadours. He refused the crown of Aragon when offered to him, but allowed his son to accept it. His daughter, Margaret, married Henry VI of England. After a long and prosperous rule René died at Aix. He had no direct heirs and his possessions, therefore, reverted to the French crown. Consult *Œuvres du roi René*, edited by Quatrebarbes (4 vols., Angers, 1844–46); Leroy de la Marche, *Le roi René: sa vie et ses travaux* (Paris, 1875); Edgcumbe Staley, *King René d'Anjou and his Seven Queens* (New York, 1912).

RENÉE (re-nā') **OF FRANCE** (It. *Renata*) (1510–1575). A French princess, daughter of Louis XII, born at Blois and married in 1527 to Ercole II, of the house of Este (q.v.), Duke of Ferrara. With him she differed greatly on religious matters, being a zealous supporter of the Reformation, of Calvin, to whom she gave refuge in 1535, and of Bruccioli, who dedicated to her his version of the Bible in Italian. During the Inquisition she was imprisoned (1554), confessed and attended mass, but after her liberation returned to Protestantism. After her husband's death (1559) she settled in Montargis, where she protected her coreligionists during the civil wars. Calvin wrote her many letters of counsel. Consult Millicent Fawcett, *Five Famous French Women* (London, 1905).

RENEVIER, rĕn'vyā', EUGÈNE (1831–1906). A Swiss geologist, born and educated in Lausanne. There he became professor of geology, paleontology, and mineralogy in 1857, curator of the Vaudois Geological Museum in 1864, and a founder of the Swiss Geological Society and of the Paleontological Association (1874). Besides many important contributions to periodicals and work on the international geological chart of Europe, he wrote: *Description des fossiles du terrain Aptien* (1854–58), with Pictet; *Notices . . . sur les Alpes vaudoises* (1864–79); *Carte géologique des Alpes vaudoises* (1875–77); *Orographie des Hautes Alpes* (3d ed., 1881); *Chronographie géologique* (1897).

REN'FREW. A county of southwest Scotland, bounded on the north and west by the River and Firth of Clyde, on the south by Ayrshire, and east and north by Lanarkshire (Map: Scotland, D 4). Area, 240 square miles. Renfrew is very uneven in its surface and consequently in the nature and quality of its soil. At the Hill of Stake, on the Ayrshire border, the land rises to 1711 feet. Over two-thirds of the arable land is devoted to dairy farming. There are extensive mineral deposits in the county, and the exportation of coal, oil, and ironstone employs a large number of people. Chief towns, Renfrew, the capital, Greenock, Port Glasgow, and Paisley (qq.v.). Pop., 1901, 268,900; 1911, 314,552.

RENFREW. A royal, parliamentary, and municipal burgh, capital of Renfrewshire, Scotland, on the Clyde, 6 miles west-northwest of Glasgow (Map: Scotland, D 4). The Renfrew Grammar School and Blythswood Testimonial, originally endowed by charter of Robert III, is here. The inhabitants are employed in ironworks and in shipbuilding. Pop., 1901, 9297; 1911, 12,565.

RENFREW. A town in Renfrew Co., Ontario, Canada, situated on Bonnechère River and on the Grand Trunk and Canadian Pacific railways (Map: Ontario, J 2). The town has a collegiate institute and drill hall. Manufactures include refrigerators, machinery, foundry products, butter, flour, hosiery, sashes and doors, etc. Pop., 1901, 3153; 1911, 3846.

RENI, rā'nē, GUIDO (1575–1642). An Italian painter, one of the chief masters of the Eclectic school. (See BOLOGNESE SCHOOL OF PAINTING.) Born at Calvenzano, near Bologna, Nov. 4, 1575, the son of a musician, he was apprenticed at an early age to Denys Calvaert. He then studied under the Carracci, especially under Lodovico, but aroused their jealousy, and soon parted company with them and applied himself to the technique of fresco painting under Fer-

GUIDO RENI

"AURORA," FROM THE FRESCO IN THE ROSPIGLIOSI PALACE, ROME

time in the jungle and on the plains of Bengal. The large amount of map material he collected was used in the preparation of the *Bengal Atlas*, which appeared in 1779, a work of the first importance for strategical and administrative purposes. His map of Hindustan, accompanied by about 200 pages of letterpress, appeared in 1783, and marked the time when Rennell ceased to be merely a surveyor and map maker and became a geographer in the more extended sense. Having received a serious wound in an encounter with a fanatic, Rennell retired from the service in 1777 and lived for the remainder of his life in London, and for fifty years, from 1780 to 1830, he was one of the leading geographers of Europe, and the great critic of geographical work and elucidator of geographical problems. Comfortably established with his wife, Jane Thackeray, great-aunt of the novelist, whom he had married in India in 1772, he now began the construction of the first approximately correct map of India, and many years elapsed before it was superseded by the more accurate trigonometrical survey. He then turned his attention to Western Asia between India and the Mediterranean. He had conceived a scheme for a great work on the comparative geography of Western Asia, but he never completely carried it out, his *Geography of Herodotus*, which formed only a part of the project, occupying him for many years.

Rennell's studies of Herodotus made him a very high authority on all matters relating to African geography, and he became the coadjutor of the African Association when that body inaugurated the modern era of the exploration of that continent. His map of Northern Africa, prepared for the use of the association, was the result of immense research combined with sagacious reasoning. He elucidated the reports of explorers, and his maps illustrated their travels. He constructed the map of the discoveries of Mungo Park. As a hydrographer, also, Rennell made important advances in the study of winds and currents, and was the founder of that branch of geography which is now called oceanography. The current now known as Rennell's current, a stream in the ocean moving northward athwart the mouth of the English and Irish channels, was revealed by his study of a great number of facts collected by seamen. His body was buried in Westminster Abbey.

RENNENKAMPF, rĕn'*e*n-kämpf, PAUL K. VON (1854–). A Russian general, born in one of the Baltic Provinces. He entered the military service in 1870 and, after attending a military academy, was called to the staff. In 1899 he was given command of the Transcaucasian army, becoming major general the following year, when he helped to subdue the Boxer uprising in China. During the Russo-Japanese War he commanded a division of cavalry and won great distinction by many daring raids. In the revolutionary days of 1905 he was notoriously severe in his repressive measures. In the European War (see WAR IN EUROPE) Rennenkampf participated in the Russian invasion of East Prussia, but was relieved of his command for failure to reach an important strategical point (the environs of Warsaw) in time to hem in the advancing German armies. In 1915 he was placed on the retired list. Prior to his disgrace he was generally regarded as one of the ablest Russian generals. His own account of the battle of Mukden may be read in *Der zwanzigtagige Kampf meines Detachements in der Schlacht von Mukden* (1909).

REN'NERT, HUGO ALBERT (1858–). An American philologist, born in Philadelphia. He graduated in 1876 from the University of Pennsylvania, where (after taking the degree of Ph.D. at Freiburg in 1892) he became professor of Romance philology. He was elected member of the Spanish Royal Academy and of the Hispanic Society of America. His writings include: *Spanish Pastoral Romances* (1892); *The Life of Lope de Vega* (1904); *Comedias of Miguel Sanchez; The Spanish Stage in the Time of Lope de Vega* (1909); besides editions of writings of various Spanish authors.

RENNES, rĕn. The capital of the Department of Ille-et-Vilaine, France, at the confluence of the rivers Ille and Vilaine, 155 miles east of Brest by rail (Map: France, N., D 4). It is divided into the upper or new town and the lower or old town. It has remains of its mediæval walls, towers, and gates, beyond which lie extensive suburbs. Bridges unite the two divisions of the town, the older portions of which lie on the left bank of the quay-lined Vilaine. The most noteworthy buildings are the modern cathedral, whose interior is a spacious hall of Grecian architecture, the stately Palais de Justice, the Hôtel de Ville, the Lycée, the Palais Universitaire with its fine art museum, and the handsome modern university. Tree-lined boulevards, the spacious Champ de Mars with a war monument commemorating 1870–71, and the Jardin des Plantes add to the town's attractions It carries on an active trade and has manufactures of agricultural implements, stockings, lace, sailcloths, and earthenware. The town is the seat of an archbishopric and of a university, with faculties of law, science, and letters, which has an attendance of about 1420. It was almost totally destroyed by a great fire in 1720, and was rebuilt on a modern plan. Rennes is the Celtic Condate, the capital of the Gallic tribe of the Redones, whence the modern name. Under the Romans it was an important station. In the Middle Ages it was the capital of the Duchy of Brittany (q.v.). Pop., 1911, 79,372.

REN'NET (from ME. *rennen, rinnen*, AS. *rinnan, yrnan*, Goth., OHG. *rinnan*, Ger. *rinnen*, to run; connected with Lat. *rivus*, stream, Skt. *ar*, to move). A substance obtained from the fourth or digestive stomach of calves living upon milk and also from the stomachs of puppies and pigs. The active principle is obtained from the folds of the membrane lining the stomach, and is prepared commercially by soaking this lining in warm slightly salted water, filtering the resulting extract, and adding a little salt and saltpetre to preserve it. The active principle, rennin, an enzyme or ferment, has the power of coagulating or curdling the casein of milk. The extracts also contain more or less pepsin, the digestive ferment of the stomach. The action of rennet is impaired by heat, and the ferment is destroyed by high heat. The principal use of rennet or rennet extract is in making cheese, where it is employed to form the curd. See CHEESE MAKING; ENZYME.

RENNET, CHEESE. See BEDSTRAW.

REN'NIE, JOHN (1761–1821). A British civil engineer. He was born at Phantassie, Haddingtonshire, June 7, 1761, and obtained his preliminary education at the parish school of Prestonkirk and supplemented it by two years at Dunbar, where he studied pure mathematics. After serving as a workman he studied at Edinburgh, and in 1784 secured employment at the

works of Boulton and Watt at Soho, near Birmingham. Here his mechanical genius soon displayed itself; and so highly did Watt esteem Rennie that he gave him, in 1789, the sole direction of the construction and fitting up of the machinery of the Albion Mills, London; and the ingenious improvements effected in the wheelwork, shafting, and frames were so striking that Rennie at once rose into general notice as an engineer of great promise, starting as a mechanical engineer on his own account in 1791. To this mill engineering he added, about 1799, the construction of bridges, and in this branch also his talent and ingenuity were manifest. The elegance and solidity of his constructions, the chief examples of which were at Kelso, Leeds, Musselburgh, Newton-Stewart, Boston, and New Galloway, were universally admired. Rennie's greatest work of this kind was Waterloo Bridge, over the Thames at London. Another of his works was Southwark Bridge, built on a new principle, with cast-iron arches resting on stone piers. He also drew up the plan for London Bridge, which, however, was not commenced until after his death. He superintended the execution of much canal work, and the London Docks, the East and West India Docks at Blackwall, as well as many others, were all designed and executed under his superintendence. He also planned many improvements of harbors and on the dockyards of Portsmouth, Chatham, Sheerness, and Plymouth, beginning at the last-mentioned port the most remarkable of all his naval works, the celebrated breakwater. Rennie died Oct. 16, 1821, and was buried in St. Paul's Cathedral, London.

His sons GEORGE (1791–1866) and JOHN (1794–1874) carried on their father's work, having studied under him and been associated with him in important undertakings. George built the *Dwarf*, the first screw vessel in the British navy, and from 1845 to 1848 was president of the Institution of Civil Engineers. John was knighted in 1831 upon the completion of London Bridge after his father's plans. Succeeding his father as engineer to the Admiralty, he completed the Plymouth breakwater, about which he wrote in 1848. He published also *Theory, Formation, and Construction of British and Foreign Harbors* (1851–54). Consult Samuel Smiles, *Lives of the Engineers* (London, 1861–62; new ed., 1904), and the *Autobiography* of Sir John Rennie (ib., 1875).

RE'NO. The largest city of Nevada and the county seat of Washoe County, 31 miles north of Carson City, on the Truckee River and on the Southern Pacific, the Virginia and Truckee, and the Nevada, California, and Oregon railroads (Map: Nevada, B 3). It is the seat of the Nevada State University, opened in 1886, and among other features are the United States Agricultural Experiment Station, the State Hospital for Mental Diseases, the Mackay School of Mines, the Carnegie library, Federal and Y. M. C. A. buildings, and the Moana and Laughton mineral springs. Reno is situated near the foot of the Sierra Nevada Mountains, 4484 feet above the sea, in a region devoted to farming, mining, and stock raising. It is on the Truckee-Carson Canal, a government irrigation project extending over 30 miles, watering 206,000 acres and built at a cost of $8,500,000. The city is the most important business and industrial centre in the State, containing extensive railway shops, reduction works, flour and lumber mills, foundries and machine shops, a brewery, plaster works, and meat-packing houses. Settled in 1868, Reno was incorporated as a town in 1879 and as a city in 1899. It was disincorporated two years later, but was again granted a charter in 1903. Pop., 1900, 4500; 1910, 10,867; 1915 (U. S. est.), 14,224.

RENO, JESSE LEE (1823–62). An American soldier, born at Wheeling, Va. (now W. Va.). He graduated at West Point in 1846, was brevetted second lieutenant of ordnance, and soon afterward was ordered to the front in Mexico, where he fought under General Scott from Vera Cruz to the city of Mexico. From that time until 1861 he was employed in various routine duties and in 1860 was promoted captain. On the outbreak of the Civil War he was commissioned brigadier general of volunteers and was assigned to a brigade in General Burnside's North Carolina expedition (Dec. 20, 1861–April, 1862), with which he participated in the capture of Roanoke Island and the actions of Newbern and Camden. For these services he was promoted major general of volunteers, and in August was ordered north to Virginia, where he fought in the second battle of Bull Run and at Chantilly. During the succeeding Maryland campaign he commanded the Ninth Corps, and was killed leading his men at the battle of South Mountain.

RENOIR, *re-nwär'*, (PIERRE) AUGUSTE (1841–). A French figure, portrait, and landscape painter, one of the most important of the Impressionist school. (See IMPRESSIONIST PAINTING.) He was born in Limoges, Feb. 25, 1841, the son of a tailor, and at first devoted himself to painting on porcelain. He then studied in Paris under Gleyre and later became associated with Sisley, Monet, and other Impressionists, taking part in their first exhibition in 1874 and repeatedly thereafter. He also exhibited at the Salon, after many rejections, in 1879, and again in 1881, 1883, and 1890. His place of residence was Paris, with short visits to Italy and northern Africa, until in later life ill health caused his removal to the Riviera, near Nice.

Renoir's art, extending over 40 years, embodies all the characteristics of impressionism. Primarily a figure painter, he excels chiefly in depicting the female nude, and, though often ignoring drawing and perspective, he succeeds marvelously in the subtle rendering of light upon flesh and in producing melting color harmonies. The feminine type he evolved, with soft, voluptuous outlines, grace of movement, and dark dreamy eyes, is fascinating and original. His portraits, especially those of children, are interesting and suggestive. Although his landscapes are criticized for a certain "woolly" technique and lack of harmonious color, they are at best comparable with the masterpieces of contemporary Impressionists, and his flower compositions are unusually fine in color. Good examples are: "The Dancer" and "The Loge" (1874); "Les Grands Boulevard" (1875); "The Swing" and "The Ball at Montmartre" (1877), both in the Luxembourg; "The Rowers" (1881); "On the Terrace"; the "Beautiful Bather" (1881); "Young Girls at the Piano" (1888); "Female Torso" (1906); "Wounded Girl" (1909). Representative portraits are those of his friends Monet, Sisley (1868), Cézanne (1880), a pastel; of Wagner (1893), Madame Charpentier and her children (1878, Metropolitan Museum, New York), and Mademoiselle Samary (1879). Many of Renoir's paintings

are in possession of M. Durand Ruel et Cie. Consult: Camille Mauclair, *The French Impressionists* (New York, 1903); Théodore Duret, *Manet and the French Impressionists* (ib., 1910), and the monograph by Meier Graefe (Munich, 1911).

RENOUARD, re-nōō'ȧr', PAUL (1845–). A French draftsman, illustrator, and painter. He was born at Cour-Cheverny (Loir-et-Cher) and studied in Paris under Pils, whom he assisted in decorating the Opera House. There he began original work by sketching the ballet, then sought inspiration in the streets, the theatres, the prisons, and finally drew every phase of contemporary life in France and England with an originality of treatment, a verve, decision, and expressive force rarely equaled by a modern draftsman. His art is essentially Impressionist and possesses the absolute truthfulness of the Japanese. Not appreciated in France at the outset, he first gained recognition with sketches for the London *Graphic*. Thereafter he contributed to the leading French, English, and American periodicals. His most noted series are: "The Copyists of the Louvre" (1880); "Irish Sketches"; "The Salvation Army"; "Thirty Etchings on the Opera"; "Seventy-five Drawings on the Dreyfus Case" (1894–99); "Album of Scenes at the Paris Exposition" (1900); "Drawings from Parisian Life for the Liége Exposition" (1905); "The Committee of Ways and Means" (result of a visit to Washington). His masterpiece, however, is the series of 200 etchings and engravings entitled "Movements, Gestes, et Expressions" (1898), embodying his profound study of movement. After 1900 Renouard also painted landscapes, portraits, and genre scenes, among the best known of which are "Change of Decoration" and "The Russian Sovereigns at the Tomb of Napoleon" (1904).

RENOUF, re-nōōf', EMILE (1845–94). A French marine, landscape, and genre painter, born in Paris. He was a pupil of Boulanger, Lefebvre, and Carolus Duran. His works usually represent scenes in the lives of fisher folk or purely marine subjects. "The Helping Hand" (Corcoran Gallery, Washington) is one of his best-known works. He also painted several views near Honfleur and a picture of the Brooklyn Bridge (in the Havre Museum), done while he was in New York City in 1887–88. "After a Storm" is in the Metropolitan Museum, New York. He received a medal of the first class at Munich in 1883 and the Legion of Honor in 1889.

RENOUF, SIR PETER LE PAGE (1822–97). An English Egyptologist, born in the island of Guernsey. He was educated at Elizabeth College (Guernsey) and at Oxford, where he became intimate with John Henry Newman (q.v.). He took an active part in the Tractarian controversy (see OXFORD MOVEMENT), and in 1842 was received into the Roman Catholic church. Renouf was none too comfortable in his adopted faith, for eventually one of his candid treatises on episodes in the history of the Church was placed on the Index. From 1846 to 1855 he resided on the Continent; thereafter until 1864 he was professor of ancient history and Oriental languages in the Roman Catholic university which Newman unsuccessfully tried to keep in operation at Dublin; and then for 22 years he was a government inspector of schools. During this period he was carrying on important studies in Egyptology. From 1886 to 1891 he was keeper of Egyptian and Assyrian antiquities in the British Museum, and in 1896 he was knighted. From 1887 till his death he held the presidency of the Society of Biblical Archæology, to the *Proceedings* of which he contributed frequently. Therein appeared, with valuable commentary, his masterly translation of the Egyptian *Book of the Dead* (q.v.). Of especial importance also are his Hibbert lectures, *Lectures on the Origin and Growth of Religion, as Illustrated by the Religion of Ancient Egypt* (1880; 2d ed., 1884).

RENOUVIER, re-nōō'vyȧ', CHARLES BERNARD (1815–1903). A French philosopher and politician. Born at Montpellier and educated at the Ecole Polytechnique, he became known through his *Manuel de philosophie moderne* (1842) and his *Manuel de philosophie ancienne* (1844). He was considerably influenced by Kant. After the revolution of 1848 he published a *Manuel républicain de l'homme et du citoyen* (1848), which was condemned for its Socialistic propositions. He retired from public life after the coup d'état of 1851. In 1872 he founded *La Critique Philosophique*, of which he was the editor until 1889, and until 1900 contributed to *L'Année Philosophique*. He published, among other works: *Essais de critique générale* (1854); *Science de la morale* (1869); *Esquisse d'une classification systématique des doctrines philosophiques* (2 vols., 1885); *Victor Hugo, le poète* (1893); *La nouvelle monadologie* (1900).

RENO'VO. A borough in Clinton Co., Pa., 28 miles northwest of Lock Haven, on the Susquehanna River and on the Pennsylvania Railroad (Map: Pennsylvania, F 3). It is of some importance as a summer resort, being situated near the Alleghany Mountains, in a picturesque region. Among the noteworthy features are the public hospital and the fine school buildings. There are valuable deposits of bituminous coal and fire clay and shops of the Pennsylvania Railroad, which constitute the chief industrial plant. Pop., 1900, 4082; 1910, 4621.

RENSE, or **RHENSE,** rĕn'ze. A village of Prussia in the circle of Coblenz on the Rhine, noted historically as the meeting place of a diet which in July, 1338, during the struggle between the emperors and the papacy, took a firm stand for the former by declaring that whoever had received a majority of electoral votes was ipso facto German King and Holy Roman Emperor without further papal confirmation.

RENSSELAER, rĕn'se-lēr. A city and the county seat of Jasper Co., Ind., 71 miles south-southeast of Chicago, Ill., on the Chicago, Indianapolis, and Louisville Railway (Map: Indiana, C 3). It is the centre of a farming district and has cement tile works and flour and lumber mills. Rensselaer is the seat of St. Joseph's College and contains the Monnet School for Girls, a public library, a courthouse, and a Catholic seminary. Pop., 1900, 2255; 1910, 2393.

RENSSELAER. A city in Rensselaer Co., N. Y., on the Hudson River, directly opposite Albany, with which it is connected by three bridges, and on the New York Central and Hudson River and the Boston and Albany railroads (Map: New York, G 5). It manufactures felt, ice tools, chains, dyes, medicines, paper boxes, skirts, furniture, picture frames, and other lumber products, but is important chiefly as a railroad town, having shops, roundhouses, freight yards, etc. Interesting features are Fort Cralo, built in 1642, Memorial Park, the Franciscan Fathers Home, and the Genet Barracks. Rensselaer was known formerly as Greenbush, which

was incorporated as a village in 1815. Pop., 1900, 7466; 1910, 10,711; 1915 (State census), 11,213.

RENSSELAER, VAN. See VAN RENSSELAER.

RENSSELAER POLYTECHNIC INSTITUTE. A school of engineering and science founded at Troy, N. Y., in 1824, by Stephen van Rensselaer as the Rensselaer School It was reorganized in 1850 under the present name as a general polytechnic institute, and was the first school of science and the first school of engineering having a continuous existence to be established in any English-speaking country. The school has long been famous for its engineering courses, and opportunities for investigation and research are offered by the many important engineering works within reach. The main building of chemical laboratories was destroyed by fire in 1904, but since that time much additional land has been acquired and eight new buildings have been erected. These include electrical, mechanical, chemical, physical, and material-testing laboratories, fully equipped with apparatus and machinery of the most modern type. In addition the institute owns valuable mineralogical, geological, and other collections and a library of scientific works containing about 21,000 books and pamphlets. The undergraduate courses include civil, mechanical, electrical, and chemical engineering, leading to the degrees of C.E., M.E., E.E., and Ch.E. A course leading to the degree of S.B. is also given, as well as graduate courses leading to the degrees of master and doctor in science and engineering. The students in all courses in 1915 numbered 646 and the faculty numbered 65. The total assets of the school amounted to about $3,300,000. The president in 1915 was Palmer C. Ricketts, LL.D. Consult Ricketts, *History of Rensselaer Polytechnic Institute, 1824–1914* (New York, 1914).

RENT (OF., Fr. *rente*, It. *rendita*, income, from ML. *rendere*, nasalized form of Lat. *reddere*, to restore, return). In classical political economy, the term "rent," when used without a qualifying phrase, refers to the payment which is made for the use of land. In the payments popularly known as rent are usually included two elements, one of which may be classed as interest on buildings and other improvements, the other as economic rent. The economic rent of any given piece of land is measured by the difference between the value of its products and the cost of the labor and use of capital employed in producing them.

Assuming the conditions of a new community with an abundance of accessible land, good and bad, it is obvious that so long as the produce of the best land is more than sufficient to satisfy the community's wants there will be no rent. Producers will be on an equality, and if any difference exists between the value of the product and the costs of production in labor and capital, it will be the same for all. As population increases the product of the best grade of lands no longer suffices to satisfy the want for food. Prices of food will rise until it will pay to bring inferior lands under cultivation. Permanent prices will have to be sufficient to cover costs in labor and capital upon these inferior lands. Since the cost of production on the better land does not increase, a surplus value will emerge in the produce of these lands. This surplus value is rent. If the owner of the better land cultivate the ground, not in person, but by tenants, this surplus is what the latter can afford to pay the landlord for the use of his land. If the favored producers are themselves cultivators, they receive the rent directly in the increased returns of their husbandry.

This simple illustration suffices to explain the law of rent, which may be briefly stated as follows: rent of land is the difference between the cost of the product and its value, the latter being determined by the cost of production upon the poorest land cultivated. In an isolated community the increase of population and the resulting pressure upon the food supply must always enhance rent, as cultivation must be extended from better to poorer soils. In other words, the pressure of population upon the means of subsistence creates rent on those lands where the means of subsistence can most easily be produced. Again, we may assume all the available land of the community to be in cultivation and yet the pressure upon the means of subsistence increases. Now, even if all the land were uniform in quality but deficient in quantity, rent must appear. No increase of product can be obtained without application of additional labor and capital to the soil. This will not be so fruitful as the first application, and hence the latter must yield a rent In this phase the law of rent may be stated as follows: the rent of land is the difference between the value of the product and its costs, value being determined by the costs of production for the product due to the least fruitful increment of capital and labor employed in cultivation. It follows that rent is a result, not a cause, of price. This principle was demonstrated by Ricardo and until recent decades was thought to establish a perfectly clear distinction between rent and other economic incomes. The rise of the Austrian school of economists (see POLITICAL ECONOMY) has, however, tended to break down this distinction in incomes. Labor and capital, like land, receive their value from their product. While it is true that no form of goods will long be produced which does not pay the prevailing rates of interest and wages, it is no less true that an agricultural product will not be produced unless it pays the ordinary rate of rent.

One of the most important practical principles that have been deduced from the demonstration of the law of rent is that a tax levied upon rent or upon the value of land, which represents merely the capitalization of the rental value, cannot raise the price to the consumer of the product of the land. This principle has served as a basis for the plan of social reform of Henry George. (See SINGLE TAX.) The fact that every increase in population or in capital increases the return to the landlord quite without his own efforts served as an ethical justification for a plan of appropriation to the state of ground rents. Recent economic theory has widely extended the application of the theory of rent. Since the time of Senior (q.v.) the term has been frequently applied to the net income from monopoly advantages, whether natural or legal. Profit (q.v.) is frequently classed as a form of rent; and Clark applies the term to any form of income which may be described differentially. Consult F. A. Walker, *Land and its Rent* (Boston, 1883), and C. E. Fillebrown, *A B C of Taxation* (New York, 1909).

RENT. In its most ancient as well as its modern sense, compensation payable by a tenant to his landlord for the land held of him. Rent has never been an incident of tenure, but even under the feudal system of landholding and when due from tenant in fee simple to his lord, rent was due only as matter of contract. It was, indeed, the service agreed by the feudal tenant to be performed (*servitium redditum*), which might or might not include a money payment and which varied according to the tenure upon which the land was held, according to the custom of the manor of which it formed a part, or according to the will of the parties.

In much the same way the obligation of the modern tenant for life or years to pay rent to his landlord is based entirely on agreement expressed in the lease or implied from the acts of the parties as to the time and manner as well as the duty of payment. This being so, a failure to pay rent does not ordinarily affect the relation of landlord and tenant so as to enable the landlord to enter and terminate the lease, nor can a tenant by terminating the relation of tenure between himself and his landlord (as by assigning his entire estate to a third person) relieve himself of the obligation to pay the rent agreed. Rent is equally independent of any other violations of duty by either party, excepting only the breach of the covenant for quiet enjoyment implied in every letting of lands.

As already indicated, a failure to pay rent does not in and of itself involve a forfeiture of the tenant's estate. The landlord's property remedy is an action at law for the rent due. At common law, however, he was provided with a more efficacious remedy in the process known as levying a distress. See DISTRESS.

The rents described by Blackstone in his famous chapter on incorporeal hereditaments (Blackstone, II, 41–43) as "certain profits issuing yearly out of lands and tenements corporeal" are obviously a very different thing from those which have just been described. The rent here referred to is a profit *à prendre* in the land of another, and it comes into existence, not by agreement or in connection with a lease, but, as such incorporeal rights always do, by grant or prescription. The right to take the rent is itself a species of real property which may be held, like any other estate, for life or years or in fee, and which is capable of alienation and, if held in fee, of transmission by inheritance. The common law distinguished three kinds of such rents, viz., rent service, rent charge, and rent seck. The rent service was merely the old feudal rent surviving into a period which had forgotten its origin. It existed only when lands were held by one of another in fee and where, accordingly, the rent due was in the nature of a feudal service. The rent charge is the rent just described as arising by grant of the owner of the land on which it is charged. The distinguishing characteristic of this rent was the fact that it was enforceable by distress. The rent seck was merely the rent charge without the power of distress annexed. Of these three forms of rent the rent service is obsolete, excepting, perhaps, in a few manors in England; rent charge survives unchanged except where distress has been abolished, and there all rents charged on land by deed or will are properly rent seck. It is to the class of rents charge rather than of contract rents that we must refer the so-called fee-farm rents. See FEE.

Maine, *Lectures on the Early History of Institutions* (7th ed., London, 1897); Sir William Blackstone, *Commentaries* (4th Amer. ed., 2 vols., Chicago, 1899); T. C. Williams, *Principles of the Law of Real Property* (19th ed., London, 1901); H. T. Tiffany, *The Law of Landlord and Tenant* (New York, 1913). See HEREDITAMENT; INCORPOREAL; LANDLORD AND TENANT; LEASE.

RENTON, rĕn'ton. A city in King Co., Wash., 12 miles south of Seattle, on the Chicago, Milwaukee, and St. Paul, the Northern Pacific, and the Columbia and Puget Sound railroads (Map: Washington, C 3). Coal mining and brickmaking are carried on and there are car works and a briquette plant. Pop., 1910, 2740.

RENTON, SIR ALEXANDER WOOD (1861–). A British jurist, born in Auchtermuchty, Fife, Scotland. He was educated at Edinburgh University, studied law at Gray's Inn, was called to the bar in 1885, began to practice on the Oxford circuit in 1886, and was puisne judge of the Supreme Court of Mauritius in 1901–05 and of Ceylon from 1905 to 1914, when he became Chief Justice. He was knighted in 1915. Renton wrote the valuable *Law and Practice of Insanity* (1896) and edited the *Encyclopædia of the Laws of England* and, with G. G. Phillimore, *The Comparative Law of Marriage and Divorce* (1910).

RENUN'CIA'TION (Lat. *renuntiatio*, from *renuntiare*, to report, renounce, from *re-*, back + *nuntiare*, to announce, from *nuntius*, a messenger). In law, the disavowal or abandonment of an official or property right. Of the latter class are the renunciation by an heir, devisee, or legatee of the property, real or personal, to which by operation of law or under the will of his testator he is entitled. Of the former class is the more frequent case of the refusal by an executor, administrator, or trustee of the office conferred upon him. The formality of renunciation is in either case of the simplest character, a letter or other written expression of intention being the usual form. In Scotland the term "renunciation" is employed to denote the surrender (q.v.) of an estate for life or years to the landlord.

REN'WICK, JAMES (1662–88). A Scottish Covenanter, born at Moniaive, Dumfriesshire. He was a student at Edinburgh University, but received no degree there, because of his refusal to acknowledge Charles II as head of the Church, and therefore finished his theological education at Groningen, Holland. In 1683 he returned to Scotland and began preaching at conventicles. He was outlawed for his collaboration with Alexander Shields in *An Informatory Vindication of the Covenanters* (1684). In 1687 he had become the virtual leader of the Cameronians (q.v.) who were excluded from the Act of Toleration, and was finally captured and executed at Edinburgh.

RENWICK, JAMES (1818–95). An American architect. He was born in New York and was educated at Columbia College. He constructed the distributing reservoir of the Croton Aqueduct in New York City and was for some years an architect on the Erie Railroad. Among the buildings designed by him were the original structure for Vassar College, Poughkeepsie; St.

Patrick's Cathedral and Grace Church, New York; and the Smithsonian Institution and the original Corcoran Gallery, Washington. Renwick left a valuable art collection to the Metropolitan Museum.

REORGANIZED CHURCH OF JESUS CHRIST OF LATTER-DAY SAINTS. This body claims to be the original church of Latter-Day Saints organized by Joseph Smith and others April 6, 1830, at Fayette, N. Y., which contention has been sustained by the courts in every case of litigation where property rights have been at issue. In the case brought in the Court of Common Pleas, Lake Co., Ohio, Feb. 23, 1880, to quiet title to Kirtland Temple property, the decision in part was: "And the Court do further find that the plaintiff, the Reorganized Church of Jesus Christ of Latter-Day Saints, is the true and lawful continuation of and successor to the said original Church of Jesus Christ of Latter-Day Saints, organized in 1830, and is entitled in law to all its rights and property." In the case for possession of Temple Lot in Independence, Mo., brought in the Circuit Court of the United States for the western division of the western district of Missouri, the decision was in perfect accord with the above.

After the death of Joseph Smith in 1844 several local churches remained intact and in 1852 they effected a general organization at Zarahemla, Wis., under the name and title of the Reorganized Church of Jesus Christ of Latter-Day Saints They reaffirmed the original tenets of the church and published the epitome of faith and doctrine as follows: "We believe in God the Eternal Father, and in his Son Jesus Christ, and in the Holy Ghost; that men will be punished for their own sins, and not for Adam's transgression; that through the atonement of Christ all men may be saved by obedience to the laws and ordinance of the gospel; that these ordinances are: (1) faith in God and in the Lord Jesus Christ, (2) repentance, (3) baptism by immersion for the remission of sins, (4) laying on of hands for the gift of the Holy Ghost. We believe in the resurrection of the body; that the dead in Christ will rise first, and the rest of the dead will not live again until the thousand years are expired. We believe in the doctrine of eternal judgment, which provides that men shall be judged, rewarded, or punished, according to the degree of good or evil they shall have done; that a man must be called of God and ordained by the laying on of hands of those who are in authority, to entitle him to preach the gospel and administer in the ordinances thereof; in the same kind of organization that existed in the primitive church, viz., apostles, prophets, pastors, teachers, evangelists, etc.; that in the Bible is contained the word of God, so far as it is translated correctly; that the canon of scripture is not full, but that God, by His Spirit, will continue to reveal His word to man until the end of time; in the powers and gifts of the everlasting gospel, viz., the gift of faith, discerning of spirits, prophecy, revelation, healing, visions, tongues, and the interpretation of tongues, wisdom, charity, brotherly love, etc.; that marriage is ordained of God and that the law of God provides for but one companion in wedlock, for either man or woman, except in cases of death or where the contract of marriage is broken by transgression." They challenge the claim made by the people in Utah that Joseph Smith received a revelation in 1843 instituting polygamy.

Churches are established in America, Europe, Asia, Australia, and the islands of the ocean. The church numbers about 75,000, with headquarters at Lamoni, Iowa. In 1915 the general officers were: Frederick M. Smith, grandson of the founder, president; Richard S. Salyards, secretary; Frederick A. Smith, patriarch; Edmund L. Kelley, presiding bishop. Heman C Smith was historian and Clyde I. Carpenter recorder.

REPAIRS'. In the law of real property, such acts of construction and amendment as are necessary to keep the buildings of an estate from deterioration and decay. By the common law of England and America a limited obligation to repair rests on the tenant in possession, whether his estate be for life or years. It is, in fact, an incident of such a tenancy and flows from the liability for waste, and it includes the wholesale restoration of premises destroyed by the negligent or willful wrongdoing of either the tenant, a member of his household, or a stranger, as well as repairs necessary to keep the premises from decay and collapse. It does not, however, extend to damage caused by the elements (acts of God) or to destruction caused by the enemy in time of war, nor generally to the effects of ordinary wear and tear. To some extent in England and generally in the United States this harsh rule of the common law has been modified by statute. The obligation to repair does not extend to a tenant at will or at sufferance, nor to a joint tenant or tenant in common (whether in possession of the premises or not), nor generally to a mortgagee in possession.

This common-law obligation of the tenant to keep the premises in repair is sometimes varied by local custom and more frequently by agreement of the parties. See EVICTION; LANDLORD AND TENANT; LEASE; WASTE.

REP'ARA'TION (Lat. *reparatio*, from *reparare*, to restore, repair, from *re-*, back again, anew + *parare*, to prepare). In law, the redress of an injury by making compensation therefor or by restoring something which has been unlawfully taken from one entitled to its possession. (See DAMAGES.) The term is also used as the equivalent of the repairs required of a tenant for life or years under the law of waste or of the holder of a benefice under the law of dilapidations. See DILAPIDATION; REPAIRS; WASTE.

REPARATION. See REGENERATION, IN PLANTS.

REPEAL (OF. *rapeler*, Fr. *rappeler*, to recall, revoke, repeal, from *re-*, back + OF. *apeler*, Fr. *appeler*, to call, appeal, from Lat. *appelare*, to address, appeal, call, summon). The abrogation of a statute by a subsequent act of a legislative body. Where an act declares in positive terms that another shall be abrogated, it is said to be an express repeal, but where a statute contains provisions inconsistent with a prior one, and does not refer to it directly, it is said to repeal the latter by implication. The provisions of the subsequent act must be absolutely contrary or repugnant to those of the former, so that it is clear that they must have been intended to supersede the former, in order to work out a repeal by implication. An act may repeal only portions of another, and the provisions not

thus repealed will continue in force. The same is true where a subsequent statute is only inconsistent with a former one in some of its provisions. Where it is desired to alter some of the provisions of an act, it is usually amended by striking out some part of it and substituting new provisions. An amendment, therefore, is a change or alteration, whereas a repealing act abrogates or wipes out the provisions of the statute to which it applies. See ABROGATION; STATUTE.

REPEALERS. See PARTY NAMES.

REPEATING DECIMALS. See CIRCULATING DECIMALS.

REPEATING RIFLE. See RIFLE, HUNTING; SMALL ARMS.

REPENT'ANCE (OF., Fr. *repentance*, from ML. *repentens*, repentant, from Lat. *re-*, back again, anew + *pœnitere*, to repent, frequentative of *pœnire*, *punire*, to punish, from *pœna*, punishment, expiation, pain, from Gk. *ποινή*, *poinē*, punishment; connected with Gk. *τίνειν*, *tinein*, Skt. *ci*, to avenge). Sorrow for sin and renunciation of the same. It is intimately connected with faith (q.v.), since faith is the turning of the soul towards God, and repentance is the same act considered as a turning away from sin. It is synonymous with conversion when used of the original and decisive abandonment of sin which marks the beginning of the Christian life; but, unlike conversion, which occurs but once, daily repentance should follow daily sins. It is a consequent of regeneration (q.v.), which is God's act calling forth repentance and conversion. Adequate repentance embraces all sin as such, known or forgotten, and involves the condemning sentence of conscience and the voluntary activity of the will in forsaking it, and both choosing and executing acts of holiness in its place The motive leading to true repentance must be nothing short of a perception of the evil of sin in itself, as violating the law of conscience and of God. Any lesser motive, as sense of danger or fear of the wrath of God, is not sufficient to produce a true repentance, which must embrace the love of God and sincere submission to His holy will

REPHAIM, rĕf'ā-ĭm *or* rē-fā'ĭm (Heb. *Rĕphāīm*). 1. A popular name of the prehistoric inhabitants of Palestine, especially to the east of the Arabah (q.v.). The Hebrew *rāphā* means weak, and hence is used of the shades of the dead (e.g., Isa. xiv. 9). It has, therefore, been supposed by some scholars that the term is applied to the early legendary inhabitants, whose ghosts were thought still to haunt their ancient homes and who were magnified into giants. In this sense the word may be used in 2 Sam. xxi. 16 et seq. Most definite are the interesting antiquarian notes in Deut. ii. 10, 20, where reference is made to the predecessors of Moab and Ammon and they are described as a gigantic folk; cf. the tradition concerning the Anakim, whom Israel encountered in south Palestine (Num. xiii. 33). In Deut. iii. 11 Og, the King of Bashan, is recorded as a descendant of this gigantic race, and the proof of his stature is given in an enormous bedstead of iron. It is not impossible, however, that there was an ancient people called Rephaim and that a reference to them belonged to the historical nucleus preserved in Gen. xiv. Consult Driver, *Commentary on Deuteronomy*, p. 40 (London, 1895). 2. The valley of Rephaim, the scene of the two battles in which David broke the power of the Philistines (2 Sam. v. 18, 22, xxiii. 13; 1 Chron. xiv. 9 et seq.); also famous for fertility (Isa. xvii. 5). The location is given in Josh. xv. 8, 9, xviii. 16, as contiguous to the valley of Hinnom, and it is identified with the broad valley running for 2 miles southwest from Jerusalem, a strategic vantage point for the invaders and also affording coöperation with the non-Israelitish city of Jerusalem.

REPH'IDIM (Heb. *Rĕphīdīm*, probably refreshments, from *rāphad*, to support, succor). A station in the route of Israel to Sinai (Ex. xvii. 1, 8, xix. 2; Num. xxxiii. 14 et seq.). It was the scene of a rebellion of the people for lack of water, which Moses supplied by a miracle, whence, according to tradition, the names Massah (tempting) and Meribah (striving) were given to the place. Here Israel routed Amalek by miraculous interposition, an account of which was recorded in writing. Here Jethro, Moses's father-in-law, paid him a visit. But, as in the case of most of the stations, no local tradition of the name survives, and we have no means at present of determining where Rephidim was located. The identification with the oasis of Feiran goes back to Eusebius. See SINAI.

REPIN, ryā'pĭn, ILIA YEFIMOVITCH (1844–). A Russian historical, genre, and portrait painter, born at Tchuguyev in the Government of Kharkov. The son of a poor Cossack officer, he was first instructed by an obscure painter in his native place, and soon earned a living by painting saints' images until enabled, in 1865, to go to St. Petersburg, where he studied first under Ivan Kramskoy (1837–87), the leader of the new naturalistic movement, and then at the Academy. In 1870 his "Raising of Jairus's Daughter" brought him the great gold medal and a traveling scholarship. Before leaving Russia he painted and in 1873 exhibited in Vienna and St. Petersburg the "Burlaki" (Bargemen on the Towpath) (Tretiakov Gallery, Moscow), the first masterpiece of modern Russian painting. His best picture dating from his foreign sojourn was "Szadko in the Wondrous Realm of the Sea" (Alexander III Museum, St. Petersburg), based upon a national legend. For this he was elected a member of the Academy (1876). After his return home he joined the Society of Traveling Exhibitions, which represented the reaction against classic traditions. He settled first in Moscow and then in St. Petersburg, where he became professor at the reorganized academy and strongly influenced the younger generation. Repin's art is distinctly national; in his series of great historical and naturalistic compositions he has interpreted the soul of Russia. Among the best known are: "The Czarevna Sofia at the Chapel Window" (1879), "Back from Siberia" (1884), "The Arrest" (1880–89), "The Religious Procession" (1883), "The Duel" (1897), "Gogol Burning his Manuscripts" (1909), and "The Cossack's Reply to Sultan Mahommed IV," all in the Tretiakov Gallery, Moscow; "Ivan the Terrible and his Slain Son" (1885), and "St. Nicholas Staying an Execution" (1889), both in the Alexander Museum at St. Petersburg. After 1886 Repin devoted himself largely to portraiture, his subjects including Liszt, Rubinstein, Garshin, Pissemski, Tolstoy, and all the eminent men of Russia. Characteristic of Repin's earlier work is the element of gloom and oppressiveness. He interpreted

what he saw of the dumb, patient suffering around him, and, like Tolstoy, had the profoundest compassion for humanity. A happier atmosphere pervades some of his later pictures, and all his works exhibit great power and freedom of treatment, robust, opulent color, and truthful presentation. A humorous note, unusual in this artist, is sounded in the "Holiday Evening in Little Russia" (1881) and "Country Life in the Crimea" (1888). The Tretiakov Gallery in Moscow preserves more than 50 of his paintings. Mention must also be made of his brillant water colors, etchings, and busts, and of his illustrations for Tolstoy, Gogol, and other writers. Consult: J. Norden, *Ilja Jefimowitsch Repin* (Vienna, 1894); Richard Muther, *A History of Modern Painting* (rev. ed., New York, 1907); Christian Brinton, *Modern Artists* (ib., 1908).

REPLEVIN (OF. *replevin*, from *replevir*, from ML. *replivire*, to warrant, pledge, from *re-*, back again, anew + *plevire*, *plegiare*, to pledge). An action brought to recover the possession of goods and chattels unlawfully taken or wrongfully detained. Under the old common-law practice it was only employed to recover back goods which had been unlawfully taken from the owner, as by the ancient proceeding of distress for rent, and detinue was used for the recovery of chattels unlawfully detained. Today by statute in most jurisdictions replevin, or some action of like nature, is employed for the recovery of chattels wrongfully withheld, however the wrongful possession may have been obtained. In the action a writ is issued for the seizure of the goods, and the plaintiff is required to file a sufficient bond to cover damages which may result to the defendant. In some states the defendant may give a bond and retain possession until the action is determined. Any person who is entitled to the possession of property may maintain the action, and the defendant must rely on the strength of his own rights rather than on the weakness of the plaintiff's title. The plaintiff should allege in his complaint or declaration the value of the chattels and what damage he has sustained, and in such case is entitled to an alternative verdict and judgment commanding the return of the goods, or if that is not possible, the payment of their value, and in each case damages for their detention. The defendant must return the goods if possible, and he does not have the option of paying their assessed value instead. If the defendant is successful he is entitled to recover such damages as he has sustained, and may sue on the plaintiff's bond. Replevin is a possessory action and corresponds to ejectment (q.v.) as to real estate. See CHATTEL; DETINUE; PROPERTY; TROVER.

REPLICA. See COPY.

REPORT. In law, the written or printed account of a case which has been judicially determined. Such an account, in the most complete and accurate reports, is usually composed of a brief statement of the facts of the case prepared by the reporter, a brief summary of the arguments of counsel, including a statement of the principal authorities cited by them on the argument, and the opinion of the court. The opinion also frequently contains a statement of the facts, a statement of the court's decision of the case, and the reasoning and the authorities upon which the decision is based. The report of the case may also include dissenting opinions. The value and use of precedents in the English common law (see PRECEDENT) make the careful preparation and preservation of reports of decided cases of the highest importance. Beginning with the reports of cases contained in the yearbooks (Edward II to Henry VIII) there is a complete series of reports of cases decided in the higher English courts down to the present time. In each of the United States there are published reports of all cases decided by the courts having appellate jurisdiction, going back to the date of their organization; and there are also complete reports of the cases decided in the United States Supreme Court and the inferior Federal courts having appellate jurisdiction since their creation under the United States Constitution.

The yearbooks were prepared at public expense by scribes of court or reporters who were appointed to that duty, a function which unfortunately was abandoned at the close of the reign of Henry VIII. After that time the reports were the work of private lawyers, and they sometimes bear evidences of hasty and inaccurate preparation. Some of them, however, prepared by lawyers of great learning, are of the highest value as authorities. The first chancery reports were published after the Restoration, although West's *Symboleography*, published in the latter part of the reign of Elizabeth, contained some precedents of process, bills, and answers in chancery.

In the United States generally reports of cases are now published by public officials appointed for that purpose by the court, and in those States in which the law and equity systems have been merged, law and equity cases are published together. The increase in volume of litigation has resulted in recent years in an enormous increase in the number of reports and has led to the consideration of various plans for curtailing their number.

Consult W. T. S. Daniel, *History of the Origin of the Law Reports* (London, 1884), and Eugene Wambaugh, *Study of Cases* (2d ed., Boston, 1894). For a complete list of reports, see C. C. Soule, *Lawyers' Reference Manual of Law Books and Citations* (Boston, 1884).

REPOUSSÉ, re-pōō'sā' (Fr., beaten back). A process of ornamenting thin metal by producing a pattern or design with a hammer. The finest existing specimens of this work are those of Benvenuto Cellini (q.v.), made in the sixteenth century. The art was extensively practiced by the early Egyptians and Etruscans.

In repoussé work special tools are employed, among them a hammer with an elastic handle screwed to a permanent support. Many adjustable heads are provided to suit the different parts of the work. After the pattern is roughly hammered up from the inside, the design is perfected on the outside with chasing tools. In order to make this possible a bed of some soft but resisting material is used to furnish a support for the thin, pliant metal. If the work is a hollow vessel it may be filled with melted pitch, which is permitted to harden.

This art is most successfully applied to such malleable metals as gold, silver, copper, tin, and lead. A similar effect, though lacking in artistic merit and in individuality, is produced by stamping with dies. See DIES AND DIE SINKING; EMBOSSING.

REPPLIER, rĕp'lēr, AGNES (1855–). An American essayist of French descent, born

in Philadelphia, Pa., April 1, 1855. Miss Repplier was educated at the convent of the Sacred Heart at Torresdale, Pa. She is known for her travels and for many articles in such magazines as *Scribner's* and the *Atlantic Monthly*. Her lively essay style often deals with serious subjects in a vein of light, humorous banter sometimes tinged with irony. In 1902 the University of Pennsylvania conferred on her the degree of Litt.D. She lectured at Randolph-Macon Woman's College in 1915. Her published volumes include: *Books and Men* (1888); *Points of View* (1891); *Essays in Miniature* (1892); a *Book of Famous Verse* (edited, 1892); *Essays in Idleness* (1893), perhaps her most popular work; *In the Dozy Hours, and Other Papers* (1894); *Varia* (1897); *Philadelphia: The Place and the People* (1898); *The Fireside Sphinx* (1901); *Compromises* (1904), *In our Convent Days* (1905); *A Happy Half Century* (1908); *Americans and Others* (1912); *The Cat* (1912), an anthology of prose and verse on the subject indicated.

REP'RESENTA'TION (Lat. *repræsentatio;* from *repræsentare*, to represent, from *re-*, back again, anew + *præsentare*, to present, from *præsens*, present, pres. p. of *præesse*, to be at hand, to be before, from *præ*, before + *esse*, to be). In political science, the agency through which the collective will of the people is exercised. In the city states of Greece and Italy, where pure democracies prevailed, all the citizens, in theory at least, attended the public assemblies. The comparatively small geographical area of the city state and the relatively small number of persons vested with the full rights of citizenship made it possible to govern without resort to the agency of representation. Besides, government was a simple matter then as compared with the government of a modern community, and hence the body of citizens meeting at intervals could without difficulty frame the few police regulations that were necessary and administer justice among the inhabitants. The agency of representation was first extensively employed by the Church in the ecumenical councils which it called from time to time, and this may have led to its more general employment for purposes of civil government. The idea of political representation, like many other political institutions, was a contribution of the Teutonic nations, by whom it was employed in a rude way in their popular assemblies. The first European legislature founded on the principle of representation was the Parliament of England. (See PARLIAMENT.) In 1302 Philip the Fair, King of France, summoned representatives of the three estates, nobility, clergy, and commons, to form the States-General (q.v.). In Aragon the Cortes (q.v.) acquired a very important share in the government and grew to be powerful enough to impose its will upon the monarch. In other countries of Europe about the same time national representative bodies were summoned by royal authority. The mediæval idea of representation was representation of classes and interests rather than of numbers, which is the basis of the modern idea. Each order had its own representatives, who sat apart and carried on their work independently, one class thus being able to neutralize the action of the others. A distinction was made in England between rural and urban constituencies, each having its own representatives, and this still prevails.

As regards the relation of the representative to his constituency, a popular view is that the representative is the mouthpiece of his constituency and subject to their instructions. According to this view he has no independent judgment and cannot follow the convictions which he may have reached from the most exhaustive study and reflection, if the will of his constituency be otherwise. Moreover, their own local interests are to be preferred to those of the country at large, and it is his first and foremost duty to champion those interests in preference to the national interests. A sounder view regards the representative as the interpreter of the common consciousness of right and reason. According to this view the representative is not bound by the will of his constituency, but by research and reason endeavors to discover what the general good requires. The question has been much discussed as to whether a system of representation based on mere numbers is an ideal one or even a just one. By many it is contended that an equitable system of representation would take into consideration various interests, economic, industrial, social, and religious as well as political. They insist that provision should be made for special representation of such classes as free traders, single-tax adherents, labor organizations, civic federations, business leagues, chambers of commerce, the advocates of temperance and prohibition, Socialists, etc. The tremendous tendency towards class differentiation and the growing popularity of independent movements in politics, it is said, make a reform of the present system of representation highly desirable so as to harmonize conflicting interests, to enable each class to show the people what its interests are, and to defend them against attack.

By the present system the political party having a minority of voters in a given electoral district is generally unrepresented in the government, notwithstanding the fact that its numerical strength may lack but a few votes of equaling the party which secures the entire representation. As a result of this system it frequently happens that the minority party in a State is inadequately represented in the State Legislature or in Congress. To remedy these inequalities various methods have been proposed and in some cases attempted. Of the more important of these the first to be mentioned is the so-called limited vote, according to which each voter in an electoral area is allowed to vote for a certain number of the candidates, usually one less than the number to be elected, so that if three members are to be elected from the district the minority is reasonably sure of electing one member. This method may be employed only in elections in which three or more representatives are to be chosen from the district. The chief objection to this method is that it does not allow the minority party proportional representation but only limited representation. Moreover, it allows representation only to a very large minority and makes no provision for third parties and independent movements. Another method is the so-called cumulative vote, which allows the elector as many votes as there are representatives to be chosen from the district and which permits him to distribute them among the different candidates as he pleases or to cumulate them on one or more candidates. The

advantage of this method over the first mentioned is that it enables a small minority to elect at least one member by cumulating their votes. Since 1870 it has been employed in Illinois for the election of representatives in the Legislature. The chief objection to this method is that it frequently involves a waste of votes, since a popular candidate may receive many more votes than actually necessary to elect him. As a result of this it may happen that the minority party actually succeeds in electing two representatives out of three.

What is known as the Hare or Andræ system, so called because proposed by an Englishman named Hare and introduced into Denmark by Andræ, provides for the election of representatives by general ticket and allows each elector to vote for one candidate or for a limited number, but permits him to indicate his second and third choices, etc. The total number of votes cast is divided by the number of representatives to be chosen, and the quotient is taken as the amount necessary to elect any candidate. In counting the ballots only the first choices are counted, and as soon as a candidate has received a number of votes equal to the electoral quotient he is declared elected and no more votes are counted for him. The remaining ballots which designate him as first choice are then counted for the candidate having second choice, and so on down the list until the necessary number of persons have been declared elected. Under this system the waste of votes is insignificant, but its complexity is an objection, and the element of chance enters into the scheme. Finally there is the free-list system, according to which a certain number of voters may nominate a number of candidates not exceeding the number of places to be filled. Each voter casts as many votes as there are representatives to be chosen, distributing them at will but not cumulating them on any one candidate. The number of votes necessary to elect is determined by dividing the total vote cast by the number of places to be filled. The total vote cast by each party is then divided by the electoral quotient, and the result is the number of representatives to which each party is entitled. Any deficiency is supplied from those parties having the largest fractional quotas. This plan possesses the advantage of economy and secures proportional representation. Consult: F. P. G. Guizot, *History of the Origin of Representative Government in Europe* (London, 1861); H. J. S. Maine, *Popular Government* (2d ed., ib., 1886); A. P. C. Griffin (comp.), *List of Books . . . Relating to Proportional Representation*, published by the United States Library of Congress (Washington, 1904); J. S. Mill, *Considerations on Representative Government* (People's ed., London, 1911).

REPRESENTATION. In law, a statement or assertion as to some matter of fact. Representations have significance in a legal sense when they are acted upon. Such representations may be made as the basis of numerous legal transactions. See CAVEAT EMPTOR; CONDITION; DECEIT; FRAUD; SALE; WARRANTY; ETC.

In the law of inheritance the term "representation" is also used to denote the principle upon which the issue of a deceased person take or inherit the share of an estate which their immediate ancestor would have inherited had he been living. Thus, if one dies intestate, leaving two children and the children of a deceased child surviving him, the children will each inherit one-third of the real estate of the deceased and the other third will go to the children of the deceased child, who are said to take by representation. See ADMINISTRATION; HEIR; INHERITANCE.

REP'RESENT'ATIVES, HOUSE OF. The lower house of the Congress of the United States. See COMMITTEE; CONGRESS; UNITED STATES.

REPRESENTATIVES, LEGAL. See LEGAL REPRESENTATIVES.

REPRIEVE, rē-prēv' (doublet of *reprove*, from OF. *reprover*, Fr. *réprouver*, to reprove, reject, from Lat. *reprobare*, to condemn, reject, from *re-*, back again, anew + *probare*, to test, prove, from *probus*, good). The temporary suspension of a sentence for a crime, granted by the pardoning power, which is usually the chief magistrate of a state or nation. The term is most commonly employed to denote a stay of execution of a person convicted of a capital crime. Reprieves are usually granted in order to allow an investigation into the legality of the conviction, or into alleged newly discovered evidence in favor of the condemned person. They are granted also in case of pregnancy of a woman condemned to death, in cases of alleged insanity after condemnation to death, and often pending an investigation of facts urged in an application for a pardon. See PARDON.

REPRISAL, rē-prīz'al (OF. *represaille*, Fr. *représaille*, from *reprise*, prize, a taking, from *repris*, p.p. of *reprendre*, to retake, from Lat. *reprehendere*, *reprendere*, to recover, blame, from *re-*, back again, anew + *prehendere*, *prendere*, to take). In international law, a means of securing redress without resort to war but at the same time with the use of force. It consists in forcibly seizing from an offending nation property or its equivalent belonging to the aggrieved nation or in detaining the property of an adversary with the intention of compelling it to afford the necessary redress. Reprisal is resorted to when a specific wrong has been committed, and the seizure is by way of compensation in value for the wrong. The things seized are held subject to the termination of the controversy, and are restored if the controversy is amicably settled. Reprisal is an act of retaliation and consists in applying to the subjects of an offending state treatment analogous to that which the subjects of the offended state have received. A reprisal, though an act of war in fact, is not such in intent, and, indeed, is resorted to as a means of avoiding war by securing redress without resort to the graver alternative, although it may constitute a sufficient cause of war. The forms of reprisal most commonly employed in recent times consist in placing an embargo on such ships of the offending state as may be lying in the harbors of the aggrieved state or in the seizure of its ships at sea or of any property within the jurisdiction of the state, whether belonging to the state or to private citizens. See INTERNATIONAL LAW, *Measures Short of War;* RETORSION.

RE'PRODUC'TION (from Lat. *re-*, back again, anew + *producere*, to produce, from *pro*, before + *ducere*, to lead). The fundamental property of the organic world essential in repairing losses by death and in maintaining the earth's population. Although at the outset the

result of unknown causes, it consists in a separation of a part of the body of an individual from the parent body, division of a one-celled organism into two, or a giving off of an egg cell or sperm cell from the parent. (See CELL; MITOSIS.) Reproduction and growth are inseparable, and the former is the result of growth. As Verworn states, the general process that constitutes growth is an increase of living substance, and the essence of reproduction likewise consists merely in an increase of living substance. Reproduction differs from growth in that a part of the substance separates from the original organism. If the quantity of the living substance increases further by growth, this results in a "growth beyond the measure of the individual," and the cell must divide, i.e., reproduce. The different forms of reproduction are: (1) self-division, secondary forms of which are (*a*) fission and (*b*) budding or gemmation; (2) conjugation; (3) sexual reproduction.

Reproduction by Cell Division. This is the primary mode of reproduction While that of plant and animal cells is called cell division, that of the entire one-celled plant or animal is called self-division. This has been observed in the amœba and other Protozoa, as well as in the white corpuscles of the blood (leucocytes). See AMŒBA.

Fission. Many of the lower invertebrate animals multiply by fission or by budding. In fission the body, as in certain planarian and annelid worms, after having reached a certain size but not sexual maturity by ordinary cell division, is constricted into two or more parts. Each of these several parts separates and regenerates itself into an independent perfect worm. Fission or self-division occurs in fully grown examples of many-celled animals, as in certain polyps and starfish. See cut in article AMŒBA.

Budding or Gemmation. The process of reproducing the persons of a compound individual or colony. Buds are outgrowths of a parent person that enlarge while in connection with the parent to form a new person. In the case of budding the products are unequal. All the higher plants are produced by budding and are colonies. Among animals the process occurs in Protozoa, sponges, cœlenterates, polyzoans, and tunicates. According to one view the tapeworm is a colony whose parts are produced by budding; even segments or rings of an annelid have been considered as produced by budding. Indeed, as there is no sharp line drawn between growth of the simple individual and growth of a compound individual, so no sharp line exists between ordinary development and budding; nor is there any definite distinction between cell division and division in the amœba and budding. This is seen in examples of terminal budding, when the buds appear at the end of the main axis of the parent organism, as in plants and certain Protozoa and low multicellular animals.

Conjugation. Though an anticipation of sexual reproduction, conjugation radically differs from it in the fact that two conjugating bodies are each an entire plant or animal. It occurs in the unicellular plants, such as diatoms and desmids, and in the Infusoria. Thus, in the act of conjugation of a monad-like form (*Heteromita*) a free-swimming individual approaches an anchored form, the posterior ends coming in contact; they then fuse like two drops of sirup, the nuclei sharing in the fusion. The product swims around freely, then rests, loses its flagella, and becomes encysted, then bursts open at three angles of the cyst, pouring out a swarm of spores as the result of multiple internal fission. It is usually among the Infusoria a temporary process, but in *Vorticella* the fusion is permanent. The result of conjugation upon the species is to prevent its deterioration. It is a process of rejuvenation, comparable with the intercrossing of higher plants and animals.

Sexual Reproduction. In the process, sometimes called amphigony, of reproduction by means of sexual cells, two animals, the male and the female, secrete in reproductive glands, one eggs, the other spermatozoa, the result being their union and the formation of a new individual. Here still more than in conjugation sexual reproduction results in a complete renewal or rejuvenescence of the organism. In those plants and animals which also reproduce by budding sexual reproduction arrests degeneration by the introduction of new blood. Sexual reproduction in animals is essentially the same in all classes above the Protozoa. There is a series of developmental processes embraced under the following heads: (1) Maturation of the egg; (2) the process of fertilization; (3) a process of cleavage or segmentation of the yolk (see MITOSIS); (4) formation of the three germ layers. (See EMBRYOLOGY.) The essential phenomenon in the reproduction of the many-celled animals, i.e., all above the Protozoa, is the act of fertilization or impregnation of the egg. This is effected by the entrance of a single spermatozoön into the egg. After the spermatozoön has entered the egg the head and middle portion, which contains the body called the centrosome, can still be recognized as the chromatic and achromatic parts of the spermatozoön or sperm nucleus (male pronucleus). In the protoplasm of the egg (that enveloping the nucleus and called cytoplasm) the centrosome of the sperm nucleus gives rise to rays forming asters. (See MITOSIS.) Preceded by these rays, the sperm nucleus travels towards the egg nucleus until it reaches and fuses with it to form a single cleavage nucleus. Then the centrosome divides into two, which migrate to opposite poles of the nucleus, while the cleavage nucleus changes to a cleavage spindle, which divides and thus initiates the embryonic development, the process being called cleavage or segmentation. At this point fertilization is complete (Hertwig). It also appears that of the chromatin particles (chromosomes) in the newly formed nucleus of the fertilized egg, exactly one-half of the number are furnished by the egg nucleus and the other half by the sperm nucleus. These chromosomes are regarded as the bearers of heredity, forming the physical basis of heredity. See HEREDITY.

Asexual and Unusual Modes of Reproduction. Budding and its various forms are examples of asexual reproduction. In certain insects and other animals the egg develops and gives rise to a mature individual without fertilization. (See ALTERNATION OF GENERATIONS; PARTHENOGENESIS.) Hertwig calls this sexual reproduction with degenerated fertilization. Different modes of reproduction (asexual, sexual, parthenogenesis, pædogenesis) may occur in the same species. The alternation of parthenogenesis with pronounced sexual reproduction is called alternation of generations, or heterogony.

REPRODUCTION, IN PLANTS. Three methods of reproduction are recognized in plants, appearing in succession in the evolution of plants, viz., vegetative multiplication, reproduction by spores, and sexual reproduction.

Vegetative Multiplication. In the simplest plants the body consists of a single vegetative cell, and the division of this cell results in two new individuals. In the most primitive plants this is the only method of reproduction. In the more complex (many-celled) plants cell division usually results in growth rather than in the production of new individuals (reproduction). In such plants, however, the power of vegetative multiplication continues, as when new potato plants come from tubers, new grapevines from cuttings, new begonias from pieces of a leaf, etc. In fact vegetative multiplication is conspicuous in most plants, enabling them to spread with comparative rapidity, as a strawberry spreads by means of its runners or the couch grass by its underground stems. The significance of vegetative multiplication is that ordinary (vegetative) cells rather than special reproductive cells produce new plants.

Reproduction by Spores. In general spores are produced by many-celled plants and are cells (protoplasts) freed from one plant and capable of producing another one. Their chief feature is their separation from the parent plant, so that cell division results in a new individual. When special spore-producing cells or organs appear, from which spores are discharged, they are called sporangia. In many cases, notably among the algæ, spores are provided with cilia and can swim freely in water; in other cases they are light and dry and are carried by currents of air. After its introduction spore production continues throughout the plant kingdom; e.g., the pollen grains of flowering plants are spores. See SPORE.

Sexual Reproduction. This was the last method of reproduction to appear among plants and is characterized by the fusion of two sexual cells (gametes) to form a reproductive cell (zygote). It seems clear that gametes are derived from spores, but they behave very differently. At the first appearance of sex the pairing gametes are alike in appearance and behavior, and the fusing process has been called conjugation and the zygote a zygospore. When the gametes become differentiated into sperm and egg, the fusing process is called fertilization and the zygote an oöspore or a fertilized egg. There is no real distinction, however, either in the process or the result in the two cases.

It is evident that in all the higher plants the three methods of reproduction coexist and are used under varying conditions in producing new plants. Consult any general text on the morphology of plants. For a special discussion of reproduction in plants, consult J. M. Coulter, *Evolution of Sex in Plants* (Chicago, 1914). See APOGAMY; APOSPORY; POLLINATION.

REPRODUCTION OF IDEAS. A term which, in the psychology of associationism, signified the literal reproduction or reappearance of ideas through the force of association. (See ASSOCIATION OF IDEAS.) The term is misleading, as it implies that mental processes exist and maintain their identity while absent from consciousness, and leads to the supposition of an unconscious or subconscious mind whose observation is a priori impossible. Introspection has taught us that the supposedly reproduced idea is not a copy and often does not contain even the salient structural features of its original. The original idea, e.g., may be primarily visual in character, while the corresponding reproduced idea is an auditory-kinæsthetic complex, or a conscious attitude, or merely a physiological tendency or readiness which serves as its meaning equivalent. (See THOUGHT.) Modern psychology, therefore, prefers to regard retention (q.v.) as a physiological (not a mental) function, and recognizes that reproduction, in the sense of structural reappearance, is never more than approximately realized.

If reproduction is taken in the sense of recurrence of meaning, its conditions may be said to have been intensively studied. (See IMAGINATION; MEMORY.) Establishment and persistence of associative tendencies appear to be essential, although certain authorities attribute the haunting recurrence of melodies and like phenomena to the activity of perseverative tendencies without involvement of association. In any case the conditions of association and retention may be considered to be also conditions of reproduction. Reproduction further depends upon the presence of a cue (an actively associating meaning) and upon a more or less suitable determination. (See DETERMINING TENDENCY.) It is primarily due to the lack of these factors, e.g., that in the waking life we so often fail to recall our dreams. Furthermore, reproduction is facilitated by the convergence of associative tendencies upon a single idea and is partially or entirely inhibited by their divergence from the cue. We may recall through the activity of a large number of weak tendencies, although any single one would not lead to reproduction; or we may remain speechless, not because of the lack of associations, but because of their very multiplicity.

Consult J. Ward, in *Mind*, N. S., vols. ii–iii (London, 1893–94), and F. H. Bradley, *Principles of Logic* (New York, 1905). See ASSOCIATION OF IDEAS; IMAGINATION; MEMORY; RETENTION. For reproduction as an experimental method, see MEMORY.

RE'PRODUC'TIVE SYSTEM, COMPARATIVE ANATOMY OF. The germ cells are not the only ones that are capable of increasing their numbers. This is a common property of all body-tissue cells, and by virtue of this fact the number of individuals may be increased by division of the body and subsequent regeneration (q.v.). In *Infusoria* no specialized reproductive organs are present. When the unicellular organism exceeds its size limit it divides into two parts or daughter cells. (See FISSION; REPRODUCTION.) Reproduction of sponges is either asexual or sexual. Asexual reproduction, or budding, may occur externally or internally. The sexual reproduction may be hermaphroditic or dicœcious. *Cœlenterates* are, for the most part, sexually separate, but some are hermaphrodites, as Ctenophora. There are no organs for the transmission of the sexual products to the exterior.

Sexual ducts occur for the first time in *flatworms*. In some the entire ovary produces eggs, while in other forms only a part of the ovarian cell produces egg cells and the rest, the vitellaria, is so modified that it produces only yolk. Both the female and the male glands communicate with the exterior by ducts leading to the copula-

tory apparatus. The sexes are almost always separate in echinoderms. In one group (Synapta) of the holothurians hermaphroditism is frequent. There are no copulatory organs nor accessory glands. The general organs of starfishes develop in five pairs of bundles. One pair lies in each arm, and each pair opens dorsally to the exterior by a separate opening.

In the *mollusks* the generative apparatus is composed of germ glands, ducts, and copulatory organs. The sexes are separate throughout the whole phylum. Hermaphroditism is, however, widespread. In nearly all cases of hermaphroditism both kinds of sexual products are produced in the same gland. The gonads either have separate ducts or utilize the nephridia. The genital glands open either (1) into the pericardium, (2) into some part of the kidney or uterus, (3) into the cloaca, or (4) directly to the exterior. When there are separate ducts they may be very complicated in structure. The structure of the copulatory organ and the form of the ducts with their accessory glands and tubules vary much in detail in the different species The sexes are distinct in many of the annelids, but Hirudinea, Oligochæta, and some others are exceptions. The sexes of Polychæta are separate with a very few exceptions. The ovaries or testes are segmentally repeated several or many times. The ripe eggs and sperm float in the cœlomic cavity, to be picked up and discharged to the exterior by the nephridia, or by nephridia specially modified into genital ducts.

The sexes are separate in *Crustaceæ* except in a few cases. The male and the female sexual glands are constructed on the same plan and have a similar position in the body. There is only one pair, and in certain species only one gland. The parts that make up the sexual apparatus are as follows: (1) the genital organs (ovaries and testes); (2) ducts (oviducts, vasa deferentia); (3) terminal parts (vulva, vagina, and receptaculum seminis in the female and ductus ejaculatorus in the male); (4) outer copulatory organs. Except in Cladocera and some Copepoda the genital apertures are situated on the ventral side. In all hexapods they open at the end of the abdomen. In certain species there are glands whose secretion unites the sperm cells into capsules or spermatophores. A penis may also be present. The female apparatus may possess a receptacle for the penis and another for storing the sperm. The testes and ovaries consist of a varying number of long tubes which together enter the vas deferens or oviduct. The ovarian tubes are of two kinds, those with and those without nutritive cells. The nutritive cells may alternate with the egg cells or they may be collected in a bunch and furnish nutritive material to the egg cells by means of fine constricting strands. Coming to the Chordata, we find that in *Balanoglossus* the sexes are separate, and the ovaries and testes are a row of sacular organs which open to the exterior by a series of pores or, in the American species, by rupture. Tunicates are hermaphroditic.

In *Amphioxus* the sexes are separate. The sexual organs are horseshoe-shaped sacs which lie in 26 pairs and without ducts. The ova and spermatozoa burst the atrial cavity and reach the exterior by means of the atropore. The sexes of the lamprey are separate and the sexual organ is unpaired. The sexual products pass into the body cavity and thence to the exterior by two pores into the urinogenital sinus. There is a penis in the male.

In *fishes* impregnation is internal in all the sharks except the Greenland shark. The claspers act as intromittent organs. With a few exceptions, such as the dogfish, there are two ovaries and the oviducts are separate from the ovaries. The oviducts, the Müllerian ducts, are united anteriorly and open into the body cavity. The eggs are extruded into the body cavity and then pass into the oviducts. There is a large shell gland in the oviduct. The majority of fishes lay eggs that are fertilized outside the body Most sharks and a few teleosts are viviparous, the eggs being hatched in the oviduct or ovary. In two of the sharks the yolk sac and the wall of the oviduct are united, suggesting the placenta of mammals. The ovaries of teleosts are continued backward into a duct. Posteriorly the two ducts fuse. The oviducts of the Dipnoi are somewhat coiled, like those found in Amphibia; each connects with the body cavity near the pericardium by means of a funnel-shaped aperture. Hermaphroditism is not uncommon throughout the Teleostei.

Reptiles and Birds.—The ovaries are broad in the turtles and long and narrow in snakes and elongated lizards. The ovaries are usually asymmetrical. Only the left ovary is completely developed in birds. The oviducts open into the abdominal cavity by wide funnel-shaped apertures, and in the walls of the ducts are glands for the formation of albumen and eggshells. The ovaries, like the testes, increase in size during the breeding season. In birds the vas deferens, like the ovaries, opens into the cloaca by an independent aperture. In lizards it fuses with the ureter. There is a copulatory organ in reptiles; in birds it exists only in the ducks, geese, and Ratitæ.

The genital apparatus of *mammals* lies in the lumbar and pelvic regions. When the ova are mature they pass into the body cavity or are immediately caught up by the funnel-shaped opening of the oviducts. This portion is known as the Fallopian tubes. In the majority of mammals the oviducts fuse behind the Fallopian tubes to form the uterus. It is in the uterus that the ova attach themselves to the maternal tissue and develop. The fused region behind the uterus is known as the vagina. In monotremes the Müllerian duct remains distinct and there is a cloaca. In marsupials the Müllerian duct begins to fuse to form a vagina. In most other mammals an anterior fusion of the two parts of the uterus occurs. The degree of fusion varies in different species. In Primates the only evidence of the paired origin is seen in the Fallopian tubes. The testes of mammals develop in the same position as the ovaries, but they later pass out of the abdominal cavity through an opening in the latter known as the inguinal canal and descend into the scrotal sacs; but in many mammals the testes remain permanently in the abdomen.

External genital apparatus exists as follows: In elasmobranchs there are male claspers which are inserted into the cloaca and oviduct of the female. In connection with them there is a gland which is histologically much like the uropygial glands of birds. In Amphibia the male of *Gymnophiona* alone possesses an eversible cloaca. In lizards and snakes there are two erectile penes outside the cloaca. Each is furrowed. Organs of similar nature, but much less developed, occur

in the female. Chelonians and crocodiles have a copulatory organ united with the ventral wall of the cloaca. It is made up of two fibrous fused masses and, as in the above copulatory organs, is regulated by well-developed muscles. There is a furrow on its surface. The female also has a median, less well developed organ of the same character. In most Ratitæ and some Carinatæ there is an eversible tube strengthened by two fibrous bodies. When at rest it is coiled up in the left side of the cloaca. The copulatory organ of monotremes lies between the urinogenital sinus and the cloaca and is fused with the ventral wall of the latter. In all other mammals the organ arises on the ventral wall of the cloaca. In the female it is channeled. In the male the groove is closed to form a canal. Three bodies of erectile tissue are developed in connection with the penis of man. The greater part of one of these glands occurs at the apex of the penis and is known as the glans penis. The clitoris of the female is the homologue of the male penis.

Consult: Arnold Lang, *Text-Book of Comparative Anatomy*, English translation by H. M. and Matilda Bernard (2 vols., New York, 1891–96); R. E. E. Wiedersheim, *Comparative Anatomy of Vertebrates*, English translation by W. N Parker (3d ed., ib., 1907); Parker and Haswell, *Text-Book of Zoology* (ib., 1910).

REPTILE, rĕp'tĭl *or, in Brit. usage*, rĕp'tīl (Lat. *reptile*, neut. sing., sc. *animal*, animal, from *reptilis*, crawling, from *repere*, to crawl; connected with *serpere*, Gk. ἕρπειν, *herpein*, Skt. *sarp*, to creep). A cold-blooded vertebrate animal of the class Reptilia, breathing by lungs and having a single median occipital condyle. In their larger, phylogenetic relationships reptiles occupy a central position, but are closely in affinity with birds, so that the two classes were united by Huxley into a group, Sauropsida, in distinction from the Mammalia and from the Ichthyopsida, or amphibians and fishes.

Classification. The history of the development of the ideas on the classification of reptiles is given under HERPETOLOGY (q.v.). The arrangement by Parker and Haswell is as follows:

Class REPTILIA:

Order I. Squamata.—This includes the Lacertilia (lizards), Ophidia (serpents), and Pythonomorpha (extinct snake-shaped forms, with paddle-like limbs and lizard-like skulls).

Order II. Rhyncocephalia.—Lizard-like reptiles, often huge, scaly, with walking limbs; vertebræ amphicœlous; sacrum composed of two vertebræ, teeth acrodont. This order has one living genus (*Sphenodon*).

Order III. Chelonia.—The turtles (q.v.).

Order IV. Theromorpha.—Sacrum composed of six vertebræ, limbs adapted for walking; four suborders: Anomodontia, Placodontia, Pareiasauria, Theriodontia—all extinct.

Order V. Crocodilia.—Crocodiles and alligators.

Order VI. Sauropterygia.—Extinct aquatic reptiles with a very small head, elongated neck, limbs usually flipper-like, and teeth in separate sockets.

Order VII. Ichthyopterygia.—Extinct aquatic reptiles with large head, no neck, long tail, flipper-like limbs, naked skin, and teeth lodged in a groove.

Order VIII. Dinosauria.—Extinct terrestrial reptiles, skin naked or armored, pelvis birdlike, teeth in sockets. See DINOSAURIA.

Order IX. Pterosauria (pterodactyls).—Extinct aërial reptiles with long neck, sacrum composed of two or three vertebræ, skull birdlike, sternum present, fore limbs winglike, and teeth in sockets.

An advance upon this, resulting from larger knowledge of fossil forms, has been educed by Boulanger and Gadow, so that the most complete classification now stands as follows:

Class REPTILIA:

Subclass I. *Proreptilia.*

Subclass II. *Prosauria.*—Orders: Microsauri, Prosauri.

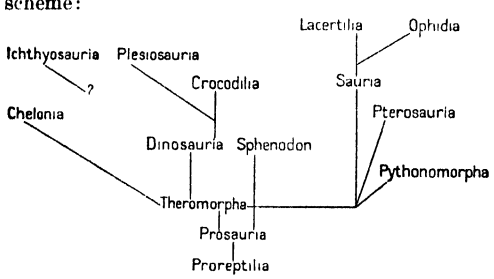
Subclass III. *Theromorpha.*—Orders: Pareiasauria, Theriodontia, Anomodontia, Placodontia.

Subclass IV. *Chelonia.*—Orders: Athecæ, Thecophora.

Subclass V. *Dinosauria.*—Orders: Sauropoda, Theropoda, Orthopoda, Ceratopsia.

Subclass VI. *Crocodilia.*—Orders: Pseudosuchia, Parasuchia, Eusuchia.

Subclass VII. *Plesiosauria.*—Orders: Nothosauri, Plesiosauri.



Subclass VIII. *Ichthyosauria.*

Subclass IX. *Pterosauria.*

Subclass X. *Pythonomorpha.*—Orders: Dolichosauri, Mosasauri.

Subclass XI. *Sauria.*—Orders Lacertilia, Ophidia.

The term "subclass" is given to the larger subdivisions "to emphasize the fact," says Gadow, "that these reptilian groups are of undeniably greater morphological value than those which are generally called 'orders' in the Mammalia." This author tries to display their supposed evolutionary phylogenetic relations by the following scheme:

The earliest fossil reptiles are found in the Permian age. Reptiles attained their highest development in Jurassic and Cretaceous times, when many were of gigantic proportions and ruled the world. Since then the order has waned, only the recent and adaptive line of snakes seeming to flourish and promise continued prosperity at the present time.

Characteristics. With the exception of modern chelonians and ancient dinosaurs, the reptiles in general are of an elongated form, the body being often nearly cylindrical and usually terminating in a very long tail. In a considerable number (as most serpents and some lizards) no traces of limbs are apparent; in some (as certain lizards) the limbs are rudimentary; while in the remainder the limbs are fully developed, although the feet rarely suffice to keep the belly from the ground. The feet are of the pentadactyl type, but not always five-toed.

The covering of the body presents several well-marked varieties. In a few of the lizards the skin is covered with regular scales, composed of a mixture of bony and horny matter and lying over each other like those of fishes: in most lizards and in serpents scales and plates are de-

veloped on the surface of the corium or true skin and covered over with epidermis, which is thrown off at intervals, the molt forming an accurate cast of the body of the animal; while in the crocodiles and tortoises the scales are converted into true bony plates, which in the former are embedded in the tissue of the skin and in the latter are united with the ribs, sternum, and other bones of the internal skeleton, to form the complete bony case into which the head and limbs of the animal can usually be retracted. See SKELETON, *Exoskeleton*.

The skeleton is completely ossified in all reptiles. The skull is small, loosely united, and articulates with the atlas, as in birds, by one condyle, which is formed mainly by the basioccipital. There is an auditory columellar apparatus within the fenestra ovalis, as in Amphibia. The mandibles consist of many pieces, and articulate with the cranium through quadrate bones—one of the principal characters separating this class from the mammals.

The mouth, except in the chelonians, is usually provided with conical teeth, adapted rather for seizing and holding prey than for dividing and masticating food. These teeth, like those of fishes, are successional; i.e., new teeth are being constantly developed, while the older ones are regularly shed (See CROCODILE.) In some instances the teeth are attached solely to the jaws, while in others they are attached also to the pterygoid or palate bones. In chelonians the teeth are replaced by a horny beak, which, according to the habits of the animal, is adapted for bruising as well as cutting and which in some species constitutes a somewhat formidable weapon.

The vertebræ, like those of other Amniota, are gastrocentrous, i.e., their centra "are formed by the pairs of intercentralia, while the basicentralia are reduced" or lost altogether; this characteristic separates reptiles wholly from amphibians. The total number is often great, especially in serpents and the tail of the lizards. The ribs form a true sternum, and the iliosacral connection is postacetabular: the former of these characters separates reptiles from amphibians and the latter from mammals. Reptiles are mainly carnivorous and swallow their prey whole. Hence the jaws are adapted, by their mobility and subdivision into segments, to open very widely, and the œsophagus is capable of great dilatation. The tongue is commonly free, elongated, and bifid, except in the crocodiles, in which it is immovable, whence the popular idea that these animals do not possess this organ. The stomach is sometimes scarcely larger than the œsophagus and intestines (as in serpents), while in other cases it forms a sac of considerable size. In either case it is capable of great dilatation. A liver, pancreas, and spleen are always present, the two former pouring their secretions into the upper part of the intestine, which is short, wide, and not much twisted, and is divided into two portions, corresponding to the small and large intestines of mammals, by a valve. It finally terminates in a wide cloaca, into which the ducts of the urinary and generative organs usually open. The kidneys differ from those of amphibians, and agree with those of birds, in having no nephrostomes and in having each its one separate ureter. See ALIMENTARY SYSTEM, EVOLUTION OF.

Reptiles breathe air only by means of lungs, and never have gills even during embryonic life. The lungs are usually of large size; but as they are not subdivided, as in mammals and birds, into innumerable microscopic air cells, the real aerating surface is comparatively small. In several groups they are merely capacious bags, whose vascular or aërating surface is but slightly increased by sacculi developed in their cells. In serpents one lung (usually the right one) is of extraordinary length, while the other remains altogether rudimentary. This inferiority of the respiratory apparatus of reptiles is further shown in the absence of those means for the continuous introduction and expulsion of air possessed by birds and still more by mammals. See RESPIRATORY SYSTEM, COMPARATIVE ANATOMY OF.

This feeble respiratory system is correlated with the absence of any covering, such as hair or feathers, which might retain the bodily heat generated by the oxygenation of the blood, as is the case in the well-clothed birds and mammals; hence the blood remains at a temperature little above that of the air or water in which these animals live, and reptiles are placed with the similarly naked or scaly amphibians and fishes as poikilothermous or cold-blooded (See ANIMAL HEAT.) The heart, unlike that of a bird or mammal, is divided into two atria and an imperfectly divided ventricle; it has no conus, but semilunar valves exist at the base of the tripartite aortic trunk; the right and left aortic arches are complete and remain functional. The red corpuscles of the blood are nucleated, biconvex and oval—a point of distinction from mammals.

The brain and nervous system present no peculiarities calling for special remark; the presence of an intercranial hypoglossal nerve separates this class from the Amphibia. The organs of the senses are well developed, but there are no lateral sense organs No reptiles have external ears, but their hearing is good. See NERVOUS SYSTEM, EVOLUTION OF.

The sexes are always separate, and the male generative organs, which are far more highly developed than in amphibians, present peculiarities which, in association with the position of the anal aperture, have been adopted by zoölogists as a basis of classification of special taxonomic value among the Ophidia. Fertilization is always internal, and most reptiles lay meroblastic eggs, from which the young hatch quickly under the influence of the warmth derived from the hot sand or decaying vegetation in which they are buried by the mother or, in a very few cases, by her incubation. The eggs are comparatively few (except in the turtle tribe) and relatively large, containing a large quantity of food yolk, so that the young are able to take care of themselves the moment they emerge; yet in most cases they receive some parental care. The integument of the eggs is parchment-like, containing little lime, and the color is always white. Certain reptiles, however, retain their ova in a sort of uterine cavity, formed by a dilatation of the oviduct near its termination in the cloaca, until the development of the embryo is so far advanced that the enveloping membrane bursts previously to the expulsion of the ovum, so that the young are actually born alive—a mode of generation to which the term "ovoviviparous" is applied. An amnion and an allantois are formed in the process of development, allying reptiles with birds and mammals. See REPRODUCTIVE SYSTEM, COMPARATIVE ANATOMY OF.

In past times reptiles have dominated the

earth, swarming in the seas, along the shores, on the land, and in the air. They reached huge size, and many were herbivorous and preyed upon by others which, as they increased in size and power, must have been the principal active agency in the extermination of the fishes, amphibians, and great cuttlefishes, which previous to the Mesozoic age were the dominant animals of the earth. The alterations of physical conditions, which seem to have progressed steadily during the Mesozoic age, towards dryness and coolness in the atmosphere, as well as towards elevation and drainage of the land, and the gradual increase of density (salinity) in the sea, were probably unfavorable to the reptilian forms of that time, both directly and indirectly, by being likewise unfavorable to the creatures upon which they fed. On the other hand, the growing clarification of the atmosphere consequent upon the draining and elevation of the land and the spread of terrestrial vegetation, which subtracted its excess of carbonic-acid gas and contributed a larger amount of oxygen, stimulated the development of superior types which began in the Permian and slowly won their way in competition with the dinosaurian and other reptiles of their day until they finally overcame them in importance. Only the heavily armored turtles and crocodiles are able to survive freely in the water, land tortoises existing only by being very small, well protected, and secretive, and lizards only by having diminished to small size and acquired great agility. The only branch of the class that seems to be prosperous is that of the snakes, whose peculiar form, adaptive qualities, and excellent endowments for escape or defense enable them to fill a peculiar and little-contested place in the economy of the world.

Fossil Forms. The living reptiles are comparatively insignificant survivors of a mighty race whose first appearance antedates the Permian period, since remains of two widely dissimilar groups occur in Permian rocks in Europe, North America, and South Africa. First becoming abundant in the Triassic, the rise of reptiles is coincident with the decadence of the Stegocephalia, the great armored amphibians. In the Jurassic the development of reptiles attained its highest level; they dominated land, sea, and air in forms as grotesque as the mythical griffon, dragon, and sea serpent. It is noteworthy that the Mesozoic reptiles paralleled nearly all the adaptations which occurred ages later among the mammals. There were land reptiles of carnivorous habit, like the cats and wolves, heavy, sluggish animals adapted to vegetable feeding, marine fishlike forms which strongly suggest the whales and porpoises, others which sat erect on the hind legs and tail, in some cases adapted to leaping like the kangaroo, and even "dragons of the air" with batlike wings. The supremacy of the reptiles extends into the Cretaceous with scarcely any diminution; in fact, it is here that several orders reach their culminating point; but towards the end of this period the dynasty of reptiles comes to an end, and at the dawn of the Eocene the mammals, which during the Mesozoic were extremely insignificant, become the reigning type.

Geographically the reptilian fauna of the Mesozoic period was almost cosmopolitan, although the contemporary faunas of widely separated regions sometimes show considerable dissimilarity. This variation may be due to different climatic conditions or to causes which prevent migration of animals. Regarding the general geological distribution of reptiles it may be stated that the Karoo formations (chiefly Lower Triassic) of South Africa have yielded the anomodont land reptiles in remarkable numbers and diversity of form, while the Middle Trias and the Jurassic of Europe are especially rich in marine forms. Above the Triassic no land reptiles are known for the Southern Hemisphere, the anomodonts having become extinct, but the northern continents, and especially North America, witnessed during the Jurassic and Cretaceous the development to gigantic size of ichthyosaurs, plesiosaurs, turtles, and especially dinosaurs. The pterodactyls attain huge proportions in the American Cretaceous, and here for the first time appear the great sea lizards or mosasaurs. It is certain that the true lizards, and probably snakes, existed in the Cretaceous, but as yet only a few doubtful remains have been discovered below the Eocene. None of the reptilian orders except those which exist at the present survived the Cretaceous, and the beginning of the Eocene witnessed a reptilian fauna essentially similar to that of to-day

The origin of reptiles from stegocephalian Amphibia cannot be doubted; and as the earliest known reptile, palæohatteria, from the Lower Permian of Saxony, is already well differentiated from its stegocephalian contemporaries, it seems probable that reptiles existed as early as the Upper Carboniferous Some of the Microsauria, a suborder of stegocephalians, are ranked by Gadow as reptiles. It is not improbable that the reptiles arose diphyletically, or in two parallel lines, from the Amphibia, and as far back as the Permian we find the widely divergent stems of the two great divisions of the order. Of late years the diphyletic character of the class has been noted by several writers, but it was not until 1902 that the two branches of reptilian descent were clearly differentiated by Osborn as subclasses, under the names Synapsida and Diapsida. These names refer to the condition of the temporal region of the skull—whether primitively a single temporal arch or separate upper and lower arches.

See special articles elsewhere in this work under the names of groups above mentioned, as DINOSAURIA; ICHTHYOSAURUS, THEROMORPHA; etc.

REPTILE FUND. See GUELPH FUND.

REPUB'LIC (Lat. *respublica; res publica,* commonwealth, from *res,* thing, affair + *publica,* public). A form of political organization in which the principal agents of government are chosen by qualified electors, to whom they are, in theory at least, responsible. Such electors may comprise the whole adult population of the state, or all qualified male citizens, or a small group of persons exercising a constitutional or hereditary power of election. The earlier republics were of the latter sort, ranging from the free but limited democracy of Athens to the narrow oligarchies which divided the sovereignty of Italy during the Middle Ages. The democratic movement of the last century has, in the freer political communities of the Western world, largely substituted a popular for an oligarchical electorate, thus giving to the world republics of the type of Switzerland, France, and the United States of America and creating a new but inaccurate definition of "republic" as synonymous with "popular government." See DEMOCRACY.

It is not to be denied that there may be a republic in reality which is not such in name, nor that a government which masquerades under republican forms may in fact be a thinly disguised monarchy or imperialism. In limiting the term "republic" to the form of government we must be understood as speaking of the form through which government is actually administered. A monarchy in which the crown has become merely the symbol of social distinction and no longer represents political authority may fairly be described as a republic in all but name; while a military autocracy, like that of the Cæsars, though veiling its assumption of arbitrary power under republican forms, is none the less a monarchy. That the English government is approximating to the former condition and that the military despotisms of Mexico and Central America are perilously near the latter cannot be denied, though it would be rash to say that in either case the conversion of the government from the one type to the other has yet become complete.

It is to the growing realization of this fact —that a republican form of government furnishes no guarantee against tyranny and that monarchy is not inconsistent with a high degree of political freedom—even more than to the conservative reaction of half a century ago, that we must attribute the change in the character and aims of the liberal movement of the last century. The widespread republican sentiment which in 1848 threatened the thrones of continental Europe has completely died out, and in its stead we find a growing sentiment for the liberalization of the monarchical institutions which survived that revolution. England has taken the place of the United States and Switzerland as the model of political reformers, and the aim is rather to transform existing institutions than to abolish them and substitute others of the republican type.

Attempts have been made, but without much success, to classify republics according to the extent to which popular power was diffused through the mass of the people. A more valid and useful distinction among governments of the republican type is found in the form in which the popular choice, whether wide or narrow, expresses itself, and this is determined not so much by political theory as by considerations of practical convenience. From this point of view republics fall into two classes, the pure and the representative. The former, illustrated in the local town government of New England, as well as in the Athenian democracy and the early Swiss republics, was strictly a government of the people by the people, all the citizens—a small and select class in Athens, the whole body of freemen in Appenzell and Schwyz—actually taking part in the administration of the state. This form of government is, from the nature of the case, limited to small and compact communities with simple and common interests, and does not lend itself to the solution of vast and complex problems of government. It is obviously unsuited to the great modern state with its large population, varied interests, and extensive dominion. For a republic of this type there is no alternative but the adoption of the representative form of government.

Democratic government everywhere, but especially in its republican form, calls for character as well as a highly developed political instinct in the mass of the people constituting the state; and when these conditions exist we may reasonably believe that, in a world which has come to cherish industrial rather than militant ideals, the popular republic may have a stability, a good order, and a capacity for progress which no other form of government has yet displayed. See CABINET; CONSTITUTION; CONSTITUTION OF THE UNITED STATES; DEMOCRACY; GOVERNMENT, and the authorities there referred to.

REPUBLICAN METHODIST CHURCH. See METHODISM; O'KELLY, JAMES.

REPUB'LICAN PARTY. In the history of American politics the term Republican has been applied to political organizations representing the most diverse principles. During the years 1791–92, under the leadership of Jefferson, the opponents of centralization in the national government were molded into an effective political party, which assumed the official name Democratic-Republican, though its members generally called themselves Republicans. Later this organization became known as the Democratic party (q.v.). During the years 1825-29 the followers of Clay and of Adams were known as National Republicans. (See WHIG PARTY.) In ordinary usage, however, the term Republican is applied to the powerful party which was organized in 1854–56 and elected Lincoln in 1860.

The present Republican party took its rise from one overpowering impulse—opposition to the extension of slavery. Northern Whigs acceded with great repugnance to the new Fugitive Slave Law of 1850 (see COMPROMISE OF 1850), and its enforcement became daily more odious When the Kansas-Nebraska Bill (q.v.) became a law the revolt was instantaneous. On the very morning after the passing of this bill, May 27, 1854, a gathering of some 30 Congressmen discussed the necessity of organizing a new party, and it was agreed that Republican would be its appropriate name. Previously, on Feb. 28, 1854, a mass meeting of Whigs, Democrats, and Free-Soilers, in Ripon, Wis., had resolved that if the Kansas-Nebraska Bill should pass they would "throw old party organizations to the winds and organize a new party on the sole issue of the nonextension of slavery." Three weeks later local organization was effected, and the name Republican was suggested as the one which the party should and probably would adopt. It was in Michigan, however, that the fusion of the opponents of the extension of slavery first completed

a State organization and formally adopted the name (July 6, 1854).

The new party was formed not so much by a coalition as by a fusion of diverse elements. There were: (*a*) a large proportion of the anti-slavery Whigs, like Seward, Greeley, and Lincoln; (*b*) the Free-Soilers (see FREE-SOIL PARTY), like Hale, Julian, and Sumner; (*c*) a great body of Know-Nothings, like Wilson, Banks, and Colfax; (*d*) some Abolitionists, who, though impatient with the Republicans' repeated assertion that they did not purpose to interfere with slavery where it actually existed, nevertheless found in the new party the best promise of effective opposition to slavery; and finally (*e*) antislavery Democrats, such as Hamlin, Cameron, and Bryant, who brought with them a strong popularizing influence. Later the war crisis led other Democrats into the Republican ranks, though in some instances, as in the cases of Butler and Johnson, their allegiance was but temporary.

Before the new party had been in existence a year it had secured a popular majority for the opponents of slavery in 15 of the 31 States and had elected 11 United States Senators and a plurality in the House of Representatives. The first Republican National Convention met at Philadelphia on June 17, 1856, and was attended by delegates from all the Northern States, from the Territories of Minnesota, Nebraska, and Kansas, from the District of Columbia, from Virginia, and from the border States of Delaware, Maryland, and Kentucky. The nomination for the presidency was given to John C. Frémont, whose career as an explorer and pioneer made him a magnetic leader. The platform declared it to be "both the right and the duty of Congress to prohibit in the Territories those twin relics of barbarism, polygamy and slavery"; it demanded the immediate admission of Kansas as a free State and denounced the Ostend Manifesto (q.v.), "with its highwayman's plea that might makes right." Whig influence was apparent in its strong declaration in favor of internal improvements at national expense, including the construction of a railway to the Pacific. Frémont obtained 114 electoral votes (Buchanan, the Democratic candidate, receiving 174) and polled a popular vote of 1,341,264, carrying all the free States with the exception of New Jersey, California, Pennsylvania, Indiana, and Illinois. (See ELECTORAL VOTES; UNITED STATES, *History*, for details on presidential elections.) A slight falling off in Republican strength in Congress reflected the waning of the first enthusiasm and the defection of some of the least disinterested members, but their places were soon more than filled by new adherents from the shattered American party and from Whigs and Democrats, to whom the Dred Scott decision and the Lecompton Bill were intolerable. During Buchanan's administration the Republicans devoted their efforts to protesting against the extension of slavery and to unsuccessful attempts to secure the passage of a homestead bill and the appropriation of public lands for educational purposes. In 1860 the Republican National Convention was held in Chicago. The platform denounced Democratic threats of disunion; insisted that the rights of the State should be maintained inviolate, especially the right of each State to order and control its own domestic institutions according to its own judgment exclusively; declared that "the normal condition of all the territory of the United States is that of freedom, which Congress is bound to preserve and defend"; demanded the prompt admission of Kansas as a free State and the passage of a homestead bill; favored a protective tariff and river and harbor improvements; and advocated a Pacific railway, to be aided by national grants. On the third ballot the nomination fell to Lincoln, largely from considerations of availability, for as yet the full measure of his strength had by no means been revealed. Governor Hamlin, of Maine, a former Democrat, was given the second place on the ticket. Out of the 303 electoral votes Lincoln received 180 and his plurality was nearly 500,000; but his strength was exclusively in the North, and his vote fell far short of a majority.

Republican rule began even before Lincoln's inauguration, for in the closing months of the Thirtieth Congress the withdrawal of Southern members gave the Republicans a majority in both Houses, a fact promptly signalized by the admission of Kansas and by the passage of a protective tariff act. The conduct of the war against the Confederate States was thrown into the hands of the loose-constructionist Republican party; yet the opposition, especially in the later years of the conflict, was vigorous. The chief war measures were enacted by Republican votes, and favorite Republican policies were also brought to realization in the Homestead Bill of 1862 and the grants in aid of railways and of education. Really pivotal, however, was the party's policy towards slavery. Here Lincoln himself took the lead. The preliminary Proclamation of Emancipation (q.v.), issued upon his own responsibility, served to "unite the South and divide the North." Formidable reaction followed, and in the autumn elections of 1862 the very existence of the Union was at stake. No one could doubt that the loss of Republican ascendancy would result in the ending of the war by some compromise which would involve the dissolution of the Union, yet the great States New York, Pennsylvania, Ohio, Indiana, and Illinois all showed Democratic majorities; but the New England States, Kansas and Minnesota, California and Oregon followed the President's leading, and the border States, too, came to the support of his policy. In the resulting Congress the Republicans found themselves in control by a majority of about 20 votes. Lincoln's policy had been vindicated: he had been clear-sighted enough to recognize that the moment had come to commit the party to an aggressive policy, and on a question of right and wrong he had been willing to trust the people. But nothing less than an amendment to the Constitution could be relied upon actually to abolish slavery forever. Such an amendment was proposed in December, 1863, but went over to the next session, and therefore became one of the vital issues of the campaign of 1864. Lincoln insisted that the advocacy of such an amendment should be made the "keystone" of the platform. The Republican Convention now declared that slavery was the cause and the strength of the rebellion; that the Constitution should be so amended as to "terminate and forever prohibit the existence of slavery within the limits or the jurisdiction of the United States"; and that no terms but unconditional surrender should be granted to the rebellious States. Lincoln was renominated by acclamation, and, as a mark of recognition of the patriotism of the loyal men of the border States, the nomination for the vice presidency

was given to Andrew Johnson, of Tennessee. Lincoln's vote in the electoral college exceeded that of his Democratic opponent, McClellan, 10 to 1, yet it is significant that his popular majority was less than 500,000. Jan. 28, 1865, with the aid of 11 Democratic votes, the joint resolution (vide Thirteenth Amendment to the United States Constitution) was passed by the House.

The end of the war found the Republican party strong and united. But a severer test awaited it in the problem of reconstruction (q.v.), and but few weeks were needed to show how irreparable a loss the party had sustained in the death of Lincoln During Johnson's administration the Republican majority in both Houses of Congress was overwhelming Between the President and Congress there speedily arose over the policy to be pursued in reconstructing the South a controversy which culminated in the unsuccessful impeachment. The party in its platform of 1868 sanctioned the reconstruction policy of Congress and insisted upon "equal suffrage to all loyal men in the South." General Grant received the unanimous nomination for the presidency. His election was made a certainty by the fact that in the South negro suffrage was protected by Federal arms, while many of the whites were still disfranchised. Consequently only four of the Southern States, Delaware, Maryland, Kentucky, and Louisiana, chose Democratic electors Republican majorities were maintained in both branches throughout Grant's first administration, although the opposition was gradually gaining strength. As a party measure the ratification of the Fourteenth and Fifteenth amendments was exacted from Mississippi, Texas, and Virginia as a condition precedent to readmission, and the appointment of Federal supervisors of elections was authorized. Stimulated by protests against the manipulation of office for private or party purposes, the Republicans passed the first law for the reform of the civil service. The growing sentiment in favor of universal amnesty, universal enfranchisement, civil-service reform, and the limiting of the power of the Federal government over the local affairs of the States led to the breaking away of the Liberal Republicans (q.v.), who in 1872 made these the chief planks in their platform. Their avowed failure to come to any agreement as to the tariff, and their ill-advised nomination of Greeley, made the movement but a slight menace to the reelection of Grant, whom the Republicans had unanimously renominated upon a platform consisting chiefly of a glorification of the party's past achievements and strongly advocating a protective tariff. As a result of the Crédit Mobilier (q.v.) and other scandals the feeling became widespread that the Republican party's long tenure of office had lowered the ethical tone of the party and had given it into the hands of self-seeking and overbearing leaders. Moreover, the Republicans, as the party in power, were held responsible for the panic of 1873. Hence defection grew to such an extent that many of the Northern States were carried by the Democrats, who in 1875 secured a majority of 182 to 110 in the House. The Republican National Convention in 1876 indorsed civil-service reform and commended the provision already made for the resumption of specie payments. The nomination for the presidency was given to Governor Hayes, of Ohio, and in the ensuing campaign many of the Liberal Republican bolters returned to their former allegiance. The result of the election was long in doubt, but by the Electoral Commission (q.v.) all the questions at issue were decided in favor of Hayes, who was declared to have received 185 votes to 184 for Tilden, his Democratic opponent.

With the administration of Hayes a new period in the history of the Republican party began. The task which faced it was new, for economic problems upon which neither party had developed well-united views had become dominant; the currency, the tariff, and commercial relations were to be adjusted to the new and rapidly expanding industrial life of the people. In the first two years of Hayes's administration the Democrats were in control of the House and in the last two years of both branches of Congress, while from the members of his own party the President received but half-hearted support, for it was by the aid of Republican votes that the Bland Silver Purchase Bill was passed over his veto and that the further retirement of United States notes was forbidden. The Republican Convention of 1880 favored a protective tariff, Federal aid to popular education, "the protection of the honest voter at the South," and thorough civil-service reform. Grant was for a time the leading candidate, but after a long contest the convention was stampeded for Garfield, who was nominated on the thirty-sixth ballot. In order to conciliate the supporters of Grant, the second place on the ticket was given to Chester A. Arthur. During the administrations of Garfield and Arthur party lines were greatly blurred. The Tariff Act of 1883 and also the Pendleton Civil Service Bill received support from both sides of the chambers, yet they were in the main regarded as Republican measures. In 1884 the Republican platform was unusually pronounced in its advocacy of a protective tariff and urged international bimetallism, the regulation of interstate commerce, and the restoration of the navy to its old-time strength and efficiency. The nomination of Blaine proved in many respects to be ill-advised. A large section of the party (see MUGWUMP) refused to support him, and gave their votes mainly for Cleveland, who was elected, carrying not only the solid South, but also New York, Connecticut, New Jersey, and Indiana. During his administration Democrats were in the majority in the House. Substantial gains were made in the reform of the civil service and in the regulation of interstate commerce (Act of 1887), both of which the Republican platform had urged. A protectionist faction in the Democratic party aided the Republicans in preventing a reduction of import duties. Cleveland's message of December, 1887, made the tariff the dominant issue of the campaign of the following year. The Republican platform declared the party to be "uncompromisingly in favor of the American system of protection"; asserted its opposition to combinations organized "to control arbitrarily the conditions of trade among citizens"; favored the "use of both silver and gold as money" and the building up of a strong navy. The nomination of Harrison, of Indiana, and Morton, of New York, helped the party to regain those States and win the election. A scanty majority was secured in both branches of Congress. The Omnibus Bill for the admission of the Dakotas, Montana, and Washington brought the Republicans some votes, and Speaker Reed's rules put the House under the firm control of the majority, although they aroused not a little opposition. The protectionist McKinley Tariff

Bill was passed, with the addition of a reciprocity clause. But in the congressional elections of 1890 the Republicans were overwhelmingly defeated, and the Democrats carried the presidential election of 1892 by a large electoral majority. The Republican platform had been very similar to that of 1888, and the nominations had aroused little enthusiasm; a rise in retail prices had followed the going into effect of the McKinley tariff and had made it unpopular. During the first half of Cleveland's second administration the Republicans were in a decided minority in both Houses. But the reaction due to the disastrous panic of 1893 and dissatisfaction with the long-deferred and inconsistent Wilson-Gorman Tariff Bill presently reversed the situation in Congress, again bringing the Republicans into control. In the campaign of 1896 the currency issue was the all-important one. Twenty-two Republican State conventions pronounced against the free coinage of silver, and the platform of the national convention asserted the party's opposition to free coinage except by international agreement. Upon the adoption of this resolution 34 free-silver delegates withdrew from the convention. The platform further "renewed and emphasized the party's allegiance to the policy of protection" and promised "to all of our products" "the most ample protection"; it favored a protectorate over Hawaii and insisted that the United States "should actively use its influence and good offices to restore peace and give independence to Cuba." In this campaign the Republicans received aid from the Gold Democrats; even the solid South was broken. McKinley received a majority over all other candidates of 286,257. The appeal which the Democrats had made to class animosity had reacted in favor of the Republicans as the party of conservatism. In the following year the Republicans found themselves in control of both branches of Congress, though their majority in the Senate was but narrow The Dingley Bill was promptly passed, restoring the strongly protective character to the tariff. The war with Spain in 1898 forced to the front questions of policy which had been quite unforeseen and on which clean-cut party lines could not be drawn. The annexation of Hawaii had long been a favorite measure with some Republicans and was effected by Republican votes. In 1899 the Republicans secured a strong majority in the Senate, and forthwith enacted a law making the gold dollar unequivocally the unit of value. Upon questions relating to the government of dependencies, however, there was some crossing of party lines, a few leading Republicans with most of the Democrats taking the ground that the United States could not govern alien peoples without the consent of the governed. In the campaign of 1900 the great issue was that of imperialistic expansion. The Republican platform renewed the pledge of independence to Cuba and declared it to be "the high duty of the government" "to put down armed insurrection and to confer the blessings of liberty and civilization upon all rescued peoples," promising them the largest measure of self-government consistent with their welfare and American duties. Again McKinley was the Republican nominee against Bryan, and he increased his vote over that of 1896. Outside of the Southern States the Democrats secured only 13 electoral votes, all from States dominated by the silver interest. In the first Congress of the new century the Republicans increased their strength in both Houses. The pledge of Cuban independence was redeemed, but within the party there arose serious differences as to the policy to be pursued towards the Philippines and also over reciprocity, which had been strongly indorsed in Republican platforms, but to which large financial interests, of great weight in Republican councils, stood inflexibly opposed.

After the assassination of McKinley in 1901 a tendency towards a fission in the party became manifest, although Roosevelt attempted as nearly as possible to carry out McKinley's policies. With the election of Roosevelt to the presidency in 1904 the split in party policy became more marked. A vigorous contest was carried on between the conservative and progressive wings, with the favor of the administration thrown largely to the latter The contest centred in the struggle for a reform of the rules of legislative procedure in Congress, in the question of regulation of railways and trusts, the conservation of natural resources, and in the question of efficiency of administration. In the West a movement had gained great headway within the party for so-called direct government (initiative, referendum, and recall, qq.v.); moreover, the Middle West manifested a tendency towards more moderate customs duties. The election of Taft in 1908, although expected to continue the policies of Roosevelt, proved in fact a triumph for the conservative wing The revision of the tariff in 1909, instead of moderating the rigors of the old law, actually increased them in many respects. The appointment of Ballinger as Secretary of the Interior was a practical defeat for the conservationists. In the contest over Canadian reciprocity (see RECIPROCITY) the administration threw its influence to the progressives. Otherwise the Taft administration was regarded as reactionary; hence the unsuccessful attempt of the progressive wing to defeat the renomination of Taft in the elections of 1912. As a consequence of the secession of the Progressive party (q v) the Republicans were overwhelmingly beaten, receiving only eight electoral votes and losing both Houses of Congress. In 1914 the Republican vote increased to a marked degree in almost every State. The effect was shown particularly in the House where a large Democratic majority was considerably reduced.

REPUBLICAN RIVER. One of the head streams of the Kansas River (Map: Kansas, D & E 3). It is formed by two forks in east-central Colorado, and flows northeast into Nebraska, then east, and finally southeast into Kansas, where it joins the Smoky Hill River at Junction City to form the Kansas River. It is about 500 miles long.

REPU'DIA'TION (Lat. *repudiatio*, from *repudiare*, to repudiate, from *repudium*, repudiation, rejection of what one is ashamed of, from *re-*, back again, anew + *pudere*, to be ashamed). The refusal of a state or government to pay its debt. It grows out of the practical bankruptcy of the state, though it often seeks justification in the plea that the obligations previously admitted were illegal and therefore invalid. Debt scaling by refunding operations frequently approaches repudiation in its practical effects, though it generally escapes the reproach of the name unless there are obligations or classes of obligations which are wholly ignored in the process. Among nations and states of weak public credit the practices mentioned are only too familiar, but the odium of the name attaches particularly to the history of the financiering of the American commonwealths. In 1790 all existing State debts had been assumed by the general government, partly on the ground of justice, because they had been contracted in the prosecution of the Revolutionary War, partly on that of expediency, as a means of strengthening the position of the central government. For a period of 40 years thereafter the State governments remained almost free from liabilities, notwithstanding the fact that the War of 1812 had called for extraordinary expenditures, and in 1830 the aggregate debt of all the States was only $13,000,000 Then began an era of extravagant speculation and reckless enterprise. Population was increasing and production was increasing even faster than population. The resources of the soil were more than equal to any demands that could be made upon them. But as yet no adequate means of communication between producer and consumer had been established, and a universal need was felt for such facilities of transportation as would insure quick delivery at moderate rates. To the sanguine colonist it seemed that the construction of railroads and canals was a work of public importance which would justify almost any financial assistance on the part of the State and would return the investment a hundredfold.

States issued bonds in aid of the construction of railroads and canals, and in the South especially subscribed to bank stock, for the purchase of which they issued bonds. In other cases they simply indorsed the bonds of railroads and banks. Nor was it difficult for the States to secure loans. The United States national credit stood high abroad. Not only had the interest been promptly paid upon the national debt, but the United States offered the extraordinary spectacle of a nation which had actually paid the principal. European money lenders, who had not yet learned to discriminate between national and State securities, felt confidence both in the honor and in the resources of the country. The bonds of the several States were therefore easily disposed of in foreign markets, until in 1842 their aggregate debt had swollen to the enormous total of $213,000,000, an increase of more than 1500 per cent since 1830. The panic of 1837 and the subsequent tightening of the money market precipitated the inevitable crash. First Indiana found it impossible to meet the interest of her debts in 1840; Ohio was saved from following her example only by extraordinary efforts. Two years later the Bank of Pennsylvania failed and every bank south of Philadelphia suspended payment. In the panic that ensued Pennsylvania, Maryland, Mississippi, Michigan, Florida, Indiana, and Illinois found themselves in a condition approaching bankruptcy. But though all these States suspended payment of accruing interest, all of them except Mississippi, Michigan, and Florida finally weathered the storm without resorting to the repudiation of any part of the capital debt.

It was in Mississippi that the word "repudiation" came into use in a message by Governor McNutt of that State suggesting the plan of "repudiating the sale of certain of the State bonds on account of fraud and illegality." The bonds, to the amount of $5,000,000, had been issued in 1838 as a subscription to stock of the Union Bank of Mississippi. As the bank succumbed early to reckless management and the security of the State became worthless, the State found itself saddled with a debt from whose expenditure it had had no benefit. It is not surprising that certain apparent irregularities in the issue of the bonds should be seized upon as a pretext for denying the debt, though the courts of the State later decided that these irregularities were not so material as to invalidate the bonds. The Legislature of Mississippi promptly branded this suggestion of repudiation as "a calumny upon the justice, honor, and dignity of the State" But though for the time being the bonds were thus saved from being formally repudiated, they fell into default. Successive governors, indeed, urged their payment, but no provision was made for the purpose until 1852, when a proposition to levy a tax to pay the bonds and interest was submitted to the people and defeated at the polls by an overwhelming majority. Florida, which in the thirties had borrowed about $3,900,000 for the support of banks, was caught in the bank failures and refused to pay her debts. In the meanwhile Michigan had repudiated a portion of its liabilities under the following circumstances: certain bonds had been disposed of to the Morris Canal and Banking Company, to be paid for in installments. The Bank of Pennsylvania had become surety for the payment of these installments as they fell due. But canal company and bank both failed. It was ascertained that a large amount of the bonds, for which only partial payment had been made, had been transferred from the canal company to the bank, the latter having full knowledge, of course, of all the facts. It is true that the bonds had been hypothecated in foreign markets and were now in the possession of innocent holders. Nevertheless the State claimed that it was bound to repay only the money it had actually received, called for the surrender of the part-paid bonds, and issued

new certificates for the amount it had actually received, with interest thereon.

The course pursued by Louisiana was equally open to criticism. The state had raised capital for internal improvements by loaning her credit to banks whose stock was secured by mortgages on real estate. During the era of prosperity these banks discounted a great deal of business paper which turned out to be bad when the day of trial came. In 1843 the Legislature enacted that all debts due to the bank should be payable in the depreciated State bonds issued by the banks at their par value. In ante-bellum times, however, repudiation was in its infancy. After the war it sprang to great proportions, as the Southern States generally repudiated their debts The burden of debts had greatly increased from 1860 to 1870, while the resources of the country had been wasted by the war. Practically no interest had been paid upon the debt contracted before the war. The so-called period of reconstruction was, moreover, riotous in its expenditure of public moneys and brought about a large increase of the debt. With the revival of old conditions and the return to power of the classes which nominally ruled the States, the inability to pay resulting from the impoverished condition of the country was combined with a reluctance to pay debts which in their opinion had been forced upon the States by outsiders. In this category they placed the accrued interest upon ante-bellum debts as well as much of the debt which had its birth in the so-called reconstruction era. It is impossible to follow the history in all its details. With pretexts of fraud, jobbing, and corruption in the issue of bonds, or on the simple plea of poverty, one Southern State after another annulled its obligations outright or so scaled them in refunding operations as to destroy a large part of their face value. The aggregate debts of the States along the coast from Virginia to Louisiana, with Arkansas and Tennessee, are computed to have reached, each State taken at its highest point, $236,000,000, while in 1880, after the policy of repudiation had been adopted, they amounted to $108,000,000 The Southern States were joined by one Northern State, Minnesota, which in 1880, after 22 years of agitation, denunciation, and negotiation, finally agreed to compromise the payment of certain railroad bonds (guaranteed by her as far back as 1858) at 50 cents on the dollar and accrued interest, the plea being that the railroads had failed to comply with the conditions of the issue. The inevitable result of repudiation has been that foreign capitalists have learned to discriminate between the values of different State securities; and while the bonds of the nonrepudiating States, including those Southern States which have not followed the example of their neighbors, command a premium, the bonds of the various repudiating States fluctuate at from 10 to 50 per cent of their face value.

Repudiation has not been confined to States. During the five years immediately following the panic of 1873, numerous cities, towns, and counties, even within those States whose corporate credit remained unimpaired, finding it impossible to meet their obligations, sought to evade them by repudiation. By appeal to the United States courts, however, their creditors could command an impartial judicial determination of the question. This is impossible in the case of States, as the Eleventh Amendment of the Constitution, adopted in 1794, expressly provides that though individuals may be sued by States, States cannot be sued by individuals. Under this amendment and the decisions which have grown out of it no power can legally coerce a State to keep its pledges. There is therefore no power in the United States government to prevent a recurrence of the humiliating spectacle of repudiation. The States only can provide remedies for it. The substantial increase of wealth in all sections of the country affords a guarantee for the future. Another and perhaps more efficient safeguard against its recurrence is to be found in the innumerable restrictions upon the debt-making power of the States which have found their way into recent State constitutions.

Consult: Isaac Butts, *Brief Reasons for Repudiation, Applicable to the War Debts of All Nations* (New York, 1869); G. W. Green, *Repudiation* (ib., 1883); W. A. Scott, *The Repudiation of State Debts* (ib., 1893); D. R. Dewey, *Financial History of the United States* (3d ed., ib, 1907).

REQUEST, LETTER OF. See LETTER.

REQUIEM, rē'kwī-ĕm (Lat., rest). In the Roman Catholic church, the mass for the dead; so called from the first word of the introit. Requiem masses were composed by many of the older masters, such as Palestrina, Vittoria, Anerio, Colonna. The most famous works of this kind in modern times are those of Mozart (1791); two of Cherubini, C minor (1793), D minor (1836); Berlioz (1837); Verdi (1873). One of the greatest choral works ever written bears also the title "requiem," although it is written to German words selected from the Bible. This is the great *Ein deutsches Requiem* by Brahms, written on the death of his mother (1868).

REQUISITIONS, rĕk'wī-zĭsh'ŭnz (Lat. *requisitio*, from *requirere*, to search for, require, from *re-*, back again, anew + *quærere*, to seek). Articles of daily consumption and use levied by an invading army, from the inhabitants of occupied territory. They must be distinguished from contributions, with which the term is often confused, the latter being properly confined to money impositions above the ordinary revenues, which legitimately belong to the invader; and from fines, which are payment exacted from a district by way of punishment for some offense committed against the occupying enemy outside the regular military operations.

The adoption by civilized nations of modern rules of warfare prohibiting pillage does not guarantee security of property to an invaded district. The experiences of the past century have authorized three methods of obtaining support for an invading army from an occupied district. (1) It may purchase provisions and like articles required for consumption; (2) it may levy them at prices fixed by the commander; (3) it may force the inhabitants to furnish them without payment and on refusal send out detachments to collect them. Thus, the produce of the farmer, the goods of the merchant, and the stock of the trader may be confiscated. By the Brussels Military Code (1874), Articles 40, 42, rules are laid down governing the making of requisitions. It is customary for the modern army to have a vast commissary train, and requisitions are relied upon only to supplement this supply. The com-

mander of the army may levy such articles as clothing and boots, to prepare which time is required, while corps commanders may requisition food and fodder for immediate use. The collections should be made through the local authorities, if these continue, by demand in writing, and receipt should be given as evidence of the compliance and as a voucher in case the government should subsequently recoup the inhabitants. The discretion of the invader must be employed to apportion these demands to the resources of the district. The Hague conferences of 1898 and 1907 attempted to regulate and limit the military practice of making requisitions on the inhabitants of conquered territory by providing that requisitions either in kind or services cannot be demanded from communities or individuals except for the needs of the army of occupation and only in proportion to the resources of the country, and that payment should, whenever possible, be made in cash or as soon as possible (Hague Regulations, 52), but during the European War which broke out in 1914 these provisions were liberally construed by the invading forces, especially in the case of the German occupation of Belgium. Contributions, on the other hand, should be imposed only "on the order and responsibility of the general in chief, or of the supreme civil authority, established by the enemy in the occupied territory" (Brussels Code, § 41). In levying contributions assessment should be made on the lines of civil taxation. Fines may be levied by the invading commander to secure the safety of his communications and his troops. Consult: "Instructions for the Government of the Armies of the United States in the Field," *General Order No 100, Adjutant General's Office* (Washington, 1863); "Brussels Military Code," in *Proceedings of Brussels Conference* (Brussels, 1874); "Hague Military Code," in *Proceedings of The Hague Conference* (The Hague, 1898).

REREDOS, rēr'dŏs (OF., behind the back) The wall, curtain, or screen at the back of an altar, usually in the form of a screen detached from the choir. It is of two forms, a slight movable screen and a permanent heavier structure Its use was not common until in the late eleventh century the change of orientation (q.v.) in the Western churches placed the priest between the altar and the congregation. Early examples were often merely tapestries hung on rods; some were screens of gold and silver reliefs rising at the back of the altar, like the Pala d'Oro at San Marco, Venice, and that at San Jacopo, Pistoia, while others were of carved ivory, like one in the Cluny Museum (Paris). The architectural screens, with niches, statues, marble reliefs, and paintings, are especially fine in English (late Gothic) and Spanish (early Renaissance) churches. The reredos and the altarpiece (see ALTAR) are often one and the same; in other cases the reredos is a permanently fixed construction, often in England dividing the choir from the retrochoir.

RESACA DE LA PALMA, rā-sä'kä dā lä päl'mä, BATTLE OF. A short but hotly contested engagement, fought on May 9, 1846, during the Mexican War, between about 5000 Mexicans under General Arista and about 2300 Americans under General Taylor, which ended in the defeat of the Mexicans. The ravine in which it occurred, covered by a thick growth of palm trees, is in Cameron Co., Tex., 4 miles north of Brownsville, on the Point Isabel road The Americans lost 39 killed and 83 wounded, the Mexicans about 160 killed, 228 wounded, and 100 missing. Consult: H. O. Ladd, *The War with Mexico* (New York, 1883); H. H. Bancroft, *History of Mexico*, vol. v (San Francisco, 1885); O. O. Howard, *Life of General Taylor* (New York, 1892). See MEXICAN WAR.

RÉSAL, rā'zäl', HENRY AMÉ (1828–96). A French mathematician and engineer, born in Plombières (Vosges) and educated at the Ecole Polytechnique and at the School of Mines. He served for 15 years as departmental engineer of Doubs, gaining some repute there for his work on the mathematics of geology. Transferred to Paris in 1870, he became professor of mechanics in the Polytechnique in 1872, was elected to the Academy of Sciences in 1873, and in 1888 was appointed inspector general of mines. Résal wrote many valuable memoirs on mechanics and physics. His published works include: *Traité de cinématique pure* (1862); *Traité de mécanique céleste* (1865, 2d ed, 1884); *Traité de mécanique générale* (1873-89); *Traité des surfaces* (1891); and a French version of Salmon's *Analytical Geometry* (1870).

RESCISSION, rē-sizh'ŭn (Lat. *rescissio*, a cutting off, retrenchment, from *rescindere*, to cut off, from *re-*, back again, anew + *scindere*, to cut). In law, the rescinding or setting aside of a contract, either by mutual agreement of the parties or by decree of a court of equity because of some legal defect in the contract. See CONTRACT.

In the case of rescission not depending on mutual agreement the right to rescind may be based either upon fraud or mistake in the inception of the contract. The right of rescission on the ground of fraud arises as soon as the party who is entitled to rescind has notice of the fraud. If with full knowledge of the fraud he continues to act under the contract or pursuant to its terms, he will be deemed to have approved the contract and to have waived his right to rescind. Upon rescission of the contract he is entitled to compel a restoration of property which he has given in performance of the contract on his part or to recover its money value in a quasi-contract action. He cannot, however, recover the property so given from third parties who are purchasers for value without notice. See EQUITY; FRAUD.

A court of equity will disregard the parol-evidence rule as to written contracts if it finds that there was actually no agreement or meeting of the minds of the parties as to the terms of the contract, and it will compel a surrender and cancellation of the written contract and a restoration of the parties to their original positions. In case of all verbal contracts one entitled to rescind may do so without the aid of a legal proceeding by merely giving notice. This right, although equitable in character, is recognized and enforced at law. Upon giving such notice to the other party to the contract it is thereupon deemed to be at an end; and the party rescinding the contract is entitled to receive back the money or property which he has given under the contract, the title to the property being revested in him by operation of law as consequence of the rescission. He may not lawfully take the property forcibly, however, but may at his election bring an action in quasi contract for the value of his performance under the contract, or trover for damages for refusal to return property, or replevin

or ejectment to recover the property itself. As a condition precedent to the exercise of the right of rescission he should also return any money or property which he has received under the contract.

In case of all contracts, whether written or verbal, if one entitled to rescind the contract on the ground of fraud is sued upon it, he may set up the fraud as a defense. Fraud is strictly an equitable defense, but it has been completely adopted by the law. It does not conflict with the parol-evidence rule, as the effect of proof of fraud is not to vary the terms of the contract, but to show that on equitable grounds the contract actually entered into should not be permitted to remain operative. If, however, one who has entered into a written contract wishes to be released from its obligations at any time on the ground of mistake, or if he wishes to be released from the contract at any time before he is actually sued upon it on the ground that the contract was induced by fraud, his only relief is in equity, since the primary relief which he seeks is the cancellation and surrender of the contract. See CHANCERY; EQUITY. See also REFORMATION.

RE'SCRIPTS (Lat. *rescriptum*, answer, from *rescribere*, to write back, from *re-*, back again, anew + *scribere*, to write). Answers of the emperors and popes to questions in jurisprudence officially propounded to them. In the Roman Empire the *rescripta principis* were one of the authoritative sources of the civil law. After the third century they increased in number rapidly and superseded the responses of the jurists as one of the most important sources of Roman law, the privilege of giving responses no longer being conferred upon the jurists. The rescripts directed to corporate and municipal bodies were known as *pragmaticæ sanctiones*, a name which has found its way into the public law of Europe. See PRAGMATIC SANCTION.

RES'CUE. In criminal law, the criminal offense of procuring or aiding in the forcible deliverance of a prisoner from lawful imprisonment by a third person. By the common law a rescuer was held guilty of the same degree of crime as the prisoner, if he knew when he rescued him that the latter was lawfully detained. This knowledge was presumed if the culprit was in prison or in the custody of an officer of the law at the time. To-day the offense is punishable in most jurisdictions by imprisonment, but not with the same severity as at common law. See PRISON BREACH.

In maritime law a rescue is the retaking of a captured prize from the enemy by prisoners of war. The latter do not acquire any rights in the recaptured property, but must return it to the lawful owners.

RESCUE GRASS, SCHRADER'S BROME GRASS, AUSTRALIAN OAT (*Bromus unioloides*). A strong-growing South American grass introduced into many parts of the world. Its leaves are flat, linear, slightly roughened, its panicles spreading with numerous rather large flattened spikelets resembling the well-known chess or cheat, to which it is closely related. It grows rapidly 1 to 3 feet high, seeds freely, and dies after seeding. In the southern United States it is regarded as one of the best winter grasses, as it makes its principal growth during cool weather. It is usually cut several times during the season, and if prevented from seeding continues for two or three years. If properly treated it is a valuable brome grass (q.v.), excelling rye or oats as a winter grass and in the large amount of nutritious hay it yields. It withstands drought well and will grow on almost any soil; its best growth, however, is on rich moist soil.

RESEC'TION (Lat. *resectio*, from *resecare*, to cut off, from *re-*, back again, anew + *secare*, to cut; connected with OHG. *sega*, Ger. *Säge*, AS. *sage*, *sayu*, Eng. *saw*), or EXCISION OF JOINTS. An operation in which the diseased bone of a joint is cut out in place of cutting off the entire limb.

RES'ERVA'TION (ML. *reservatio*, from Lat. *reservare*, to keep back, from *re-*, back again, anew + *servare*, to keep). In English law a term applied to a clause in a deed, lease, or grant of land, which reserves out of the estate conveyed a right or interest in a portion of it. An estate in a stranger, or person not a party to the conveyance, cannot be created by reservation, which can only operate in favor of the grantor himself. In the United States the word is frequently used as synonymous with "exception," which denotes, not a reserved right in land conveyed, but the exception from the conveyance of part or parcel of the land included in it. See CONVEYANCE; DEED; LEASE; MORTGAGE.

The term is also employed to describe a method of obtaining the opinion of a full bench of a court or an appellate tribunal upon a point of law as to which the trial judge is doubtful. This often saves the necessity of making a ruling compelling the parties to appeal afterward. The jury is usually allowed to find the facts, and the verdict or judgment is not entered until the reserved point is decided. In many of the American States this is accomplished by taking a verdict of the jury subject to the opinion of the court as to the legal effect of the facts found by such verdict.

RESERVATIONS, INDIAN. See INDIAN AFFAIRS; TREATIES, INDIAN.

RESERVE' (OF. *reserve*, Fr. *réserve*, from OF. *reserver*, Fr. *réserver*, to reserve, from Lat. *reservare*, to keep back). In a military sense the word is used to designate the material and personnel retained for future use. For example, in the army organization of the United States, in material there is for each division an ammunition reserve of 120 cartridges per rifle, 10,000 for each machine gun, and 100 rounds for each field gun, necessitating approximately eight ammunition wagons for each regiment of infantry or cavalry and one wagon or caisson for each gun. These vehicles are organized into wagon companies or ammunition batteries and constitute the ammunition train of the division. Supply trains, normally one for each division, carry the reserve subsistence and grain (generally three days) for the division. These trains constitute the rolling reserve following the combatant troops at such a distance as to be readily accessible when needed. In addition to the subsistence mentioned each soldier carries on his person a two days' reserve ration which is to be used only in case of extreme necessity. Reserve explosives and other material for military demolition are held at the engineer park. Wagons carrying reserve sanitary stores are usually attached to the supply train. In addition to the above supplies for field service there is maintained at depots in the rear what is known as the depot reserve,

sufficient in quantity to complete, with the reserve for field service and permanent camp, one year's supply for the army at war strength.

The word "reserve" is also applied to detachments of troops kept back or held in reserve for the purpose of securing the victory or reënforcing a threatened point. For example, there is the reserve of the advance guard, of the rear guard, of the outpost (q.v.); in combat, the local reserves of regiments and brigades; and finally the general reserve, which is the large body of troops kept in hand behind the firing lines to be used at the critical moment of the action.

The term is also applied to classes of individuals who have received military training under either the compulsory or the volunteer system in time of peace, have returned to their civil pursuits, but are still available for military service in case of war. The individuals of these classes are all known as "reservists," but have different degrees of training. In the British army before the outbreak of the Great War in 1914 the reserve troops formed three classes, the regular reserve, the auxiliary forces, and the irregular forces. The auxiliary forces were made up of territorials and the special reserve (See *Army* under UNITED KINGDOM.) The initial failure of Great Britain to play a more prominent part in the great struggle on land in 1914–15 was due to the lack of trained reservists, which lack may be ascribed to her traditional volunteer system.

In the United States a regular-army reserve was created by Act of Congress dated Aug. 24, 1912. The operation of this Act only began to be felt in the latter part of 1915, since the provisions of the Act required three or four years' service with the colors and four or three years with the reserve. Competent military critics were skeptical about the efficacy of this attempt to produce a reserve in sufficient numbers to have any appreciable effect in case of a great war. The only other so-called reserves available in the United States are the National Guard organizations and such volunteer troops as may be raised and trained after the outbreak of war.

For reserve in all armies, see *Army* under the titles of the different countries; also ARMIES AND ARMY ORGANIZATION; ARSENAL; CONSCRIPTION; DEPOT; LANDSTURM; LANDWEHR; MILITIA; VOLUNTEER.

RESERVE BANK, FEDERAL. Under the Banking Act of Dec. 23, 1913, 12 reserve districts were created and Federal reserve banks were established in the following cities: Boston, New York, Philadelphia, Cleveland, Richmond, Atlanta, Chicago, St. Louis, Minneapolis, Kansas City, Dallas, San Francisco. In these Federal reserve banks each national bank of the corresponding district is required to take stock to the extent of 6 per cent of its paid-up capital and surplus. State banks also are permitted under similar conditions to take stock in the Federal reserve bank, provided that they submit to requirements as to reserve, etc., similar to those of the national banking system. Each Federal reserve bank has nine directors, three representing the banks of the district, three representing commerce, agriculture, and industry, and three representing the government and appointed by the Federal Reserve Board. The latter body, which has ultimate control over the system, consists of the Secretary of the Treasury and the Comptroller of the Currency, ex officio, and of five members named by the President with the advice and consent of the Senate.

The function of the Federal reserve banks is to mobilize the reserves of the banking system and to provide means for united action in time of crisis. They are bankers' banks, and have no direct dealings with the public. Reserves deposited with them by member banks afford a basis for a business in acceptances and rediscounts for member banks. Each member bank has a right to rediscount with the reserve bank short-term paper of approved grades, and thereby is enabled to draw upon the resources of the reserve bank when it is in danger of becoming overloaned. The Federal reserve banks are also lawful depositories of government surplus funds, and through his control of the deposit of such funds the Secretary of the Treasury may enable any regional bank to make more liberal provision for rediscounts within its district than its bank reserve funds would permit. The position of the reserve banks is further strengthened by the power to issue notes on the security of commercial paper, against which they are required to hold a gold reserve of 40 per cent.

The business of rediscounting, to which the Federal reserve banks are adapted, is developing very slowly in the United States. In its first two years of operation the Federal reserve system has served chiefly the psychological purpose of giving to the credit institutions assurance of relief in case of need The following statement for Dec. 4, 1915, exhibits the business condition of the system:

RESOURCES

Gold reserve	$325,181,000
Legal-tender notes, silver, etc	32,681,000
Bills discounted and bought	51,356,000
United States bonds	13,875,000
Municipal warrants	17,821,000
Federal reserve notes	18,118,000
Due from Federal reserve banks	19,775,000
All other resources	6,552,000
Total	$485,359,000

LIABILITIES

Capital paid in	$54,859,000
Government deposits	15,000,000
Reserve deposits	392,966,000
Federal reserve notes	13,969,000
All other liabilities	8,565,000
Total liabilities	$485,359,000

See BANK, BANKING, *Banking Reform;* REDISCOUNTING. Consult Willis, *The Federal Reserve* (New York, 1915), and the *Federal Reserve Bulletin,* issued by the Federal Reserve Board (Washington, 1915).

RESERVE, NAVAL. See NAVAL RESERVE.

RESERVED CASES. A term applied in the Roman Catholic church to sins of a heinous character, such as heresy, simony, and sacrilege, that for their adequate treatment require the attention of an ecclesiastic superior to the parish priest, either the Pope, the bishop, or the head of an order. Consult Hausmann, *Geschichte der papstlichen Reservatfalle* (Regensburg, 1868), and Thomas Slater, *Manual of Moral Theology* (New York, 1909).

RESERVOIR, rĕz'ĕr-vwôr. See DAMS AND RESERVOIRS; WATER WORKS.

RESHID PASHA, re-shēd' pä-shä', MUSTAPHA MEHEMET (1802–58). A Turkish statesman and long the chief of the Party of Progress in Turkey, born at Constantinople. In 1833

he negotiated the Treaty of Kutaia with Mehemet Ali (q.v.), the rebellious Viceroy of Egypt. In 1837 he was made Prime Minister and aided the Sultan Mahmud II in carrying out his plans for the reform of the administration; but the Old Turkish party forced him out of his office before the close of 1838. After this he was sent as Envoy to London, Berlin, and Paris. On the death of Mahmud II, in 1839, when the Ottoman throne was tottering under a fresh onslaught by Mehemet Ali, Reshid Pasha was again called to take charge of the Foreign Office by the mother of the young Sultan, Abd-ul Medjid. He succeeded, in 1839, in obtaining a constitutional charter, which, however, soon became a dead letter. His foreign diplomacy checked Mehemet Ali in Syria through the intervention of the Quadruple Alliance (Great Britain, Austria, Prussia, and Russia), but a seraglio intrigue led to his dismissal. From 1841 to 1845 he was the Turkish representative at the French court. In 1845 he was once more made Foreign Minister, and in 1846 he was appointed Grand Vizier. He was repeatedly deposed, and almost immediately recalled, according as the antireform party gained or lost the favor of the Sultan; but the complications with Russia which arose in 1853 threw the antireformers into discredit, and Reshid Pasha, more powerful than ever, was again recalled to the direction of foreign affairs. In 1855 he again retired from office, which he did not resume till after the Peace of Paris.

RESHT, rĕsht. The capital of the Province of Ghilan, Persia, situated near the southwest shore of the Caspian Sea, 150 miles northwest of Teheran (Map: Asia, Central, C 4). The houses are tiled and neatly built and the streets are paved. There are a vast ruined palace, numerous caravansaries, large bazars, and about 1200 shops and warehouses. Indian wares are imported from Balfrush in Mazanderan, and European manufactures from Russian Armenia. Resht is the chief entrepôt for the Persian silk trade. Extensive manufactures of shawls and carpets are carried on and there are oil deposits in the neighborhood. Pop., between 30,000 and 40,000. Enzeli, the port of Resht, on the Caspian Sea, about 18 miles distant, has 1500 inhabitants.

RESICZABÁNYA, rĕ'shīts-ō-bän'yŏ. A mining town in the County of Krassó-Szörény, Hungary, about 50 miles southeast of Temesvár. There are extensive iron and coal mines and iron works in the vicinity Pop , 1900, 11,770: 1910, 12,578

RESIDENCE, rĕz'ĭ-dens (ML. *residentia,* from Lat. *residere,* to reside, remain, from *re-,* back + *sedere,* to sit; connected with Gk. ἕζεσθαι, *hezesthai,* OChurch Slav. *sĕsti,* Skt. *sad,* Goth. *sitan,* OHG. *sizzen,* Ger. *sitzen,* AS. *sittan,* Eng. *sit*). The obligation to perform in person the duties of a benefice whose revenue was enjoyed. It was early a complaint that this obligation was violated. The Council of Sardica (347) in its twelfth canon enjoined upon bishops and in the sixteenth upon presbyters the duty of continuous service in their proper residence. The evil continued, however, and the Council of Trent endeavored to remedy it by providing in its twenty-third and twenty-fourth sessions that no prelate should absent himself from his diocese more than three months except for urgent cause. In present practice in the Roman Catholic church parish priests cannot be absent longer than one week from their cure, except with the permission of the bishop, which will not be given for more than two months in the year except for urgent reasons.

RESIDENTIAL DISTRICTS. See Housing Problem; Town Planning.

RESIDUAL (rĕ-zĭd'ū-al) **CALCULUS.** See Calculus.

RESIDUAL ROCKS (from Lat. *residuum,* remainder, from *residere,* to reside, remain). Rocks which have been produced through the decomposition and disintegration of rocks belonging to any of the larger divisions, viz., sedimentary, igneous, and metamorphic rocks. The agents which bring about these changes are in part chemical and in part physical. The active agents of chemical change at the surface of the earth are oxygen, water, and carbonic acid, all of which exist in the atmosphere and in the waters which percolate within and near the earth's surface, and the changes which they bring about are chiefly oxidation, hydration, and carbonization. The new minerals which are developed by these processes may be said to be in general lighter in weight (more bulky) and more soluble than the minerals out of which they have been formed. They are also as a class softer, and possess for the most part a fibrous or scaly texture. Particularly through the change in volume which this recrystallization involves, a physical force is brought into play which opens fractures in the rock and permits of its solution and disintegration. The more soluble constituents of the rock are taken in solution and removed, while the less soluble materials remain as a more or less incoherent mass constituting the residual-rock type. The residue from rocks of igneous and generally granitic types has been given various names such as waste, geest, Gruss, etc. In unglaciated regions residual rocks of this type occasionally possess their original textures, lacking only the compactness characteristic of those types Where situated on steep slopes the upper portions of the deposit of waste will by the force of gravitation slide down towards the valley, a process which is described as creep. In glaciated regions, on the contrary, the surface layers of waste have been carried away by the ice mantle and the hard underlying rock has usually also been planed down. The comparative recency of the glacial epochs in a geological sense thus furnishes a certain measure of the time necessary to decompose and disintegrate compact rock masses. The final product of decomposition and disintegration of granitic rocks is a fine clay, or kaolin, and this has been the source of the great deposits of porcelain clay throughout the world. Before this final stage of the alteration has been reached the residual rock has usually the structural peculiarities of a coarser or finer sand, and thus we have the residual sand of granite, etc. Calcareous rocks, such as limestone or dolomite, furnish in the initial stages of their solution and disintegration a granular calcareous sand. Joints and other fissure planes in massive rocks greatly facilitate the processes of decomposition and disintegration. The solutions which are active in these processes find their way along the joint planes as trunk lines, and by their more ready access to the edges and corners of included blocks of rock soon produce a spheroidal and often concentric structure. Thus are brought about spheroidal blocks of the igneous-rock type,

the centres of which are usually little changed, but the peripheral zones of which represent altered phases of the rock, the outermost being the most nearly disintegrated.

RESIDUARY (rē-zĭd'ū-ā-rĭ) **LEG'ACY.** A legacy of all that remains of an estate after the debts and specific legacies have been paid. Where a testator desires to give the bulk of his estate to one person and at the same time to make other smaller bequests, it is customary to make the latter by means of express or specific legacies, naming the amount or specific property, and then to devise and bequeath all the "rest, residue, and remainder" of his estate to the favored person by a residuary clause. It sometimes happens, however, after the debts and minor specific legacies are paid, that the estate is exhausted, and the one whom the testator most intended to favor gets nothing. The best method of guarding against this contingency is to put a condition in each of the specific legacies to the effect that it shall be null and void if the appraised value of the estate is not in excess of a certain sum, or to make an express or specific bequest to the person who is to take precedence over the others, then make the other minor bequests, and conclude by making the first person the residuary legatee of the rest of the estate. See LEGACY; WILL.

RESINA, rā-sē'na. A town in the Province of Naples, Italy, on the Gulf of Naples, at the foot of Vesuvius, 5 miles by rail southeast of Naples (Map: Italy, G 1). It is on the site of ancient Herculaneum. Exquisite fruits are grown, and the famous Lachryma Christi wine is made in the vicinity. There are manufactures of silk, glass, and leather. The town is surrounded by country houses, and is a place of recreation for the Neapolitans. The ascent of Mount Vesuvius is begun at Resina. Pop. (commune), 1901, 19,766; 1911, 20,152.

RESINS, rĕz'ĭnz (OF. *resine*, Fr. *résine*, from Lat. *resina*, resin, perhaps from Gk *ῥητίνη, rhētinē*, pine resin). A class of solid or semisolid substances mostly of vegetable origin. The series include many minerals which are assumed to be the product of extinct vegetation and are known as fossil resins.

Resins are allied to the volatile oils with which they are found combined in the plant, as oleo resins. Although widely divergent in chemical behavior, the resins contain only the elements carbon, hydrogen, and oxygen combined in such a confusing variety of forms that it is impossible to make any scientific classification It seems highly probable that the present system will be abandoned and the different members related to the specific forms of compounds to which they belong. The following are the general characteristics of the resins: at ordinary temperatures they are solid, translucent, and for the most part colored, although some are colorless and transparent. A few are devoid of odor, while others give off an aromatic fragrance due to the admixture of volatile oil. In the crude state they are noncrystalline and brittle, breaking with a conchoidal fracture; when pure several of them may, however, be obtained in the crystalline form. They melt at low temperatures and are inflammable, burning with a white smoky flame. Resins are insoluble in water, soluble in alcohol, ether, and various oils. They are nonconductors of electricity at ordinary temperature, but become charged with negative current by friction. Many of them possess acid properties, in which case their alcoholic solutions redden litmus. These resins combine with the alkalies and form frothy, soaplike solutions in alkaline lyes. The resinous soaps thus formed differ from ordinary soap in not being precipitated by sodium chloride.

Oleoresins are generally obtained by making incisions into the wood of trees which produce them; sometimes, however, they exude spontaneously, and in other cases require to be extracted from the wood with hot alcohol or other solvents. The crude resins are separated from the volatile oils by distillation, and from the gummy and mucilaginous matters with the aid of alcohol, which dissolves the pure resins.

Among the resins largely employed for varnish making are the natural and fossil copal obtained from Sumatra, Java, and the Philippines; dammar, from the same localities; amber and a series of fossil resins of asphaltic nature from various coal measures. An interesting resin, urushic, is one obtained by the Japanese and used in their lacquer. Ki-urushi (raw lacquer) is collected from the milky secretion of the *Rhus vernicifera*. According to Yosheida it contains urushic acid, gum, water, and a peculiar diastatic matter, together with traces of a volatile poisonous body. The phenomenon of drying is due to the oxidation of urushic acid, $C_{14}H_{18}O_2$, through the agency of the diastatic matter in the presence of oxygen and moisture. The poisonous body affects the skin in the same manner as the poison ivy

Resins also form important constituents of the substances known as gum resins (see GUMS) and are contained in the so-called balsams, a class of liquid or semisolid products including benzoin, storax, and the balsams of Peru and Tolu. Resins containing benzoic or cinnamic acid are sometimes spoken of as solid balsams. The common resin or rosin of commerce exudes in a semifluid state from several species of pine, being derived chiefly from the *Pinus australis* and the *Pinus pinaster*. The crude turpentine (an oleoresin) obtained from these trees is distilled by steam, yielding from 17 to 34 per cent of volatile product known as turpentine or "turps" and a residue of resin, a brittle solid somewhat heavier than water. Common rosin, melting point 100–140° C. (212–284° F.), specific gravity 1.08, consists largely of abietic anhydride, $C_{44}H_{62}O_4$, readily changed to abietic acid, $C_{44}H_{64}O_5$. Three grades of rosin are known in trade: virgin, made from the earliest exudations from the tree; yellow dip, the next runnings and by far the largest in yield; and hard, made from scrapings from the tree after the crude turpentine has ceased running. White rosin contains water; on its removal the color returns. Rosin is largely employed in cheap varnishes, soap, as a flux, as an adulterant of fats, waxes, and hydrocarbons, in ship calking, manufacture of resin lakes, printing inks, etc. By destructive or dry distillation rosin yields a liquid product consisting of two compounds, rosin spirit and rosin oil. Rosin spirit boils below 360° C. (680° F.), resembles turpentine, and is often used in admixture. Rosin oil, a heavy oil boiling above 360° C. (680° F.), after purification with sulphuric acid and lime water, is redistilled. By mixing with milk of lime, rosin grease (axle grease) is produced. Rosin oil is used as an adulterant for linseed and other oils. Colo-

phony, copaiba, jalap, podophyllum, and the resin of scammony are used in medicine. Colophony, or rosin, is an antiseptic and forms an excellent application for wounds and ulcers. Copaiba acts as a stimulant and disinfectant and is often prescribed in gonorrhœa. Podophyllum, jalap, and the resin of scammony are purgatives, the latter causing profuse watery evacuation of the bowels.

Thorpe, *Dictionary of Applied Chemistry* (London, 1913); Harry Ingle, *Manual of Oils, Resins, and Paints*, vol. i (Philadelphia, 1915).

RESIN WEED. See COMPASS PLANT.

RESIST'ANCE, ELECTRICAL. That property of a conductor which determines the intensity of an electric current flowing through it for a given constant difference of potential at its terminals. The resistance of a conductor varies with its temperature, but is the same for all currents. The unit of resistance, the ohm (q.v.), is such a resistance as will allow a current of one ampere to flow through a conductor when there is difference of potential of one volt between its terminals. This relation is given by Ohm's law that $C = \frac{E}{R}$, where C stands for the current, E for the electromotive force, and R for the resistance. The resistance of a homogeneous conductor will vary directly as its length and inversely as the area of its cross section, or in the case of a round wire inversely as the square of the diameter. Specific resistance is the resistance of a centimeter cube of a substance. Resistance may be measured by means of the Wheatstone bridge (q.v.) or by substituting known resistances for unknown, so as to produce an equivalent current, which is indicated by the deflection of the galvanometer (q.v.). Another method is to use the differential galvanometer and so arrange the known resistances that the same current flows through each set of coils; while there are also methods where use is made of the condenser and ballistic galvanometer.

It is a general property of solid conductors that as their temperature is lowered their electrical resistance decreases. As a temperature of — 273° C., i.e., "absolute zero," is approached, the resistance becomes minute. In some experiments performed in 1914 by Professor Onnes, of Leyden, at the temperature of liquid helium, an electrical current once produced in a coil of wire continued practically undiminished for many hours, in spite of the fact that there was no cell or source of E. M. F. acting.

See CONDUCTOR; ELECTRICAL UNITS; ELECTRICITY; OHM.

RES JU'DICA'TA (Lat., thing adjudged). In law, a matter of controversy which has been finally decided and determined on its merits by a court of competent jurisdiction. This implies that there has been no fraud or collusion by which the court has been misled. The importance of this doctrine lies in the fact that if a matter is once judicially determined it cannot again be litigated by and between the parties to the former litigation. To make the entire subject matter of an action *res judicata* all the parties interested must be made parties thereto, either as plaintiffs or defendants. Only the points actually decided come within this rule. See JEOPARDY; JUDGMENT.

RES'OLU'TION. In law, an act or official expression of the will of a legislative body, corporation, or organized assembly. The term is sometimes used as being synonymous with ordinance, when applied to an act of a municipal council or a board of aldermen. However, resolutions are usually adopted to authorize ministerial acts or to express the sentiment or regard of a body, whereas ordinances are passed to prescribe permanent rules of conduct or law.

In the civil law the discharge of a valid contract by consent of the parties or by decree of a court is said to be a resolution of the contract. This is distinguished from a rescission, which implies that the contract was void ab initio.

RES'ONANCE (OF. *resonnance*, Fr. *résonnance*, from Lat. *resonantia*, echo, from *resonare*, to sound back, from *re-*, back again, anew + *sonare*, to sound, from *sonus*, sound; connected with Skt. *svan*, to sound). A general mechanical property which has many illustrations in nature. If a large bell is to be set in motion, it is only necessary to apply a series of impulses regularly timed at intervals to correspond with the natural period of the body. The column of air in a bottle or tube may be set in vibration by waves whose period is the same as that of the column of air. If a train of ether waves passes through some material medium the minute portions of which have a frequency the same as that of the waves, it will set these portions of matter vibrating. The waves thus lose energy, which is gained by the matter. Resonance applies in all forms of wave motion and especially in electromagnetic waves, where in wireless telegraphy the proper tuning of the circuit is an essential. See ABSORPTION OF WAVES; RADIATION; WIRELESS TELEGRAPHY.

RES'ONA'TOR. A device used in acoustics (q.v.) to reënforce or strengthen a given tone. Resonators, which are used largely in the analysis of sound, consist of hollow vessels usually bulb-shaped or cylindrical. The air of such a vessel has a natural period of vibration, and when the resonator is brought near a sounding body which is emitting waves of the same frequency the former will take up the vibration and will emit the sound. In analyzing sound which is made up of numerous harmonics or overtones the resonator will select a particular sound, which it will reënforce. Resonators like wooden boxes are frequently used to mount tuning forks, and are constructed of such dimensions that contained air will vibrate in unison with the fork and strengthen the sound.

RESORCIN, rĕz-ôr'sĭn, or **RESORCINOL,** rĕz-ôr'sĭ-nôl (from *res-in* + *orcin*), $C_6H_4(OH)_2$. A diatomic phenol first obtained by Hlasiwetz and Barth in 1864 by fusing resins with potassium hydroxide. It has since been obtained by various other reactions. On an industrial scale it is made by fusing the sodium salt of meta-benzene-disulphonic acid with caustic acid, resorcin being thus produced according to the following chemical equation:

$$C_6H_4(SO_3Na)_2 + 2NaOH = C_6H_4(OH)_2 + 2Na_2SO_3$$

Sodium *m*-benzene-disulphonate	Caustic soda	Resorcin	Sodium sulphite

The mixture is acidified with hydrochloric acid, and the resorcin is separated by means of ether or some other liquid in which it is soluble. The crude resorcin thus obtained is purified by distillation. It may be added that the meta-benzene-disulphonic acid used in making resorcin is obtained by heating benzene with fuming sulphuric acid. Pure resorcin is a colorless crystalline substance melting at 119° C. (246.2° F.) and boiling at 276.5° C. (529.7° F.). It has a faint odor and a sweetish taste, but leaves a disagreeable pungent aftertaste. It is freely soluble in water, alcohol, ether, benzene, amyl alcohol, glycerin, and other organic liquids. Resorcin is largely used in the arts for the preparation of phthalein dyes, such as fluorescein, eosin, etc.; it is also employed in the manufacture of azo colors. It is often used in medicine. When applied externally it has the effect of removing scales in chronic skin diseases; it is an excellent remedy for dandruff, a mixture of resorcin and glycerin being best employed for this purpose.

RESORCIN YELLOW. See COAL-TAR COLORS.

RES'PIRA'TION (Lat. *respiratio*, from *respirare*, to breathe), ARTIFICIAL. The exchange of air as in natural breathing (see RESPIRATION, ORGANS AND PROCESS OF), produced by mechanical means. Respiration is suspended when for any reason the muscles concerned in breathing are deprived of their wonted nervous stimulation by poisoning of the nerve centres which govern them. This may take place in asphyxiation by poisonous gases, in drowning, poisoning, or by prematurely cutting off the placental circulation during parturition, and it is in these circumstances that artificial respiration finds its greatest usefulness. (See ASPHYXIA.) The object in resuscitation (q.v.) is to imitate as closely as possible the natural respiratory movements. These should be rhythmical and at the rate of 12 or 14 to the minute. Several methods of carrying on artificial respiration have been devised. Of these the most generally useful is that of Sylvester. In this method the body of the person to be revived is placed upon the back, the shoulders being slightly elevated and high enough to keep the chin from falling forward on the chest. The arms are then grasped just above the elbows and raised upward and forward to their full extent and at the same time rotated slightly outward. This position is maintained for two or three seconds and secures inspiration. The arms are now lowered and pressed firmly against the sides of the chest, thus bringing about expiration. These movements are repeated in alternation with regularity and precision at the rate above mentioned. Before proceeding with artificial respiration in cases of drowning certain preparations have to be made. To drain off water from the stomach and chest, the patient is stripped to the waist and placed face downward with the pit of the stomach raised above the level of the mouth by a roll of clothing or other material placed transversely beneath the trunk. Pressure is then made upon the patient's back. The tongue must be held out, the larynx kept open, and the mouth and throat cleared of mucus. Efforts to resuscitate should be continued for at least an hour, apparently inanimate individuals having been brought to life at the end of that time, after having been immersed half an hour or longer. Attempts to restore respiration should be supplemented by friction, the administration of stimulants, and the application of heat to the abdomen and lower extremities.

Schultz's method, applicable especially to the resuscitation of newly born infants, is as follows: The operator stands behind the patient. The shoulders are grasped, with an index finger in each armpit, the thumbs over the shoulders, and the rest of the fingers resting obliquely over the back. The whole weight of the child's body is now allowed to hang from the shoulders. This lifts the ribs, expands the chest, and produces mechanical inspiration. Expiration is produced by swinging the child forward at arms' length to a point where the lower limbs and pelvis topple over towards the operator, thus bringing about extreme flexion of the trunk and forcing the abdominal viscera against the diaphragm. This motion is then reversed, and the process repeated at the rate of eight or nine times a minute.

In the method of Byrd-Dew the neck is supported by one hand, the thighs upon the other, the child lying upon its back. The head is allowed to fall backward so that the glottis may remain freely open The body is then alternately extended and flexed, which movements determine respectively inspiration and expiration.

Fell's method of artificial respiration consists in pushing a tube into the larynx and trachea and forcing warmed air into the lungs by means of a bellows. Expiration is secured by pressure on the sides of the chest.

Marshall Hall's method consists in placing the patient on one side and alternately rolling him face downward to compress the chest and on his back to allow the elasticity of the ribs to expand the chest.

Laborde's method depends on rhythmical traction of the tongue. This organ is seized, as far back as possible, between the thumb and index finger wrapped in linen, and alternately pulled forcibly forward and relaxed. This method is supposed to excite breathing by reflex action.

A practicable and very useful method especially for young children is mouth-to-mouth insufflation. A piece of gauze is laid over the mouth of the child and air breathed directly into its lungs from those of the operator. Consult C. A. Lauffer, *Resuscitation* (2d ed., New York, 1915). See PULMOTOR.

RESPIRATION, IN PLANTS. A series of processes by which plants release the necessary energy for growth, movement, and similar work. Although the true nature of respiration in plants was stated by Ingenhouss before the beginning of the nineteenth century, and its relation to growth and the evolution of heat was clearly set forth by De Saussure in 1804, confusion between photosynthesis and respiration has persisted to the present day.

The method of obtaining energy in the presence of free oxygen by oxidizing and decomposing materials within the body is known as normal respiration. Respiration in absence of oxygen is spoken of generally as anaërobic and in higher plants more specifically as intramolecular. In some organs of higher plants intramolecular respiration is almost entirely alcoholic fermentation, and it is generally closely related to some type of fermentation.

Under ordinary conditions almost all plants are able to absorb free oxygen from the atmosphere at all times. But if the absorption of

free oxygen is impossible, intramolecular respiration sets in as a poor substitute for normal respiration, for in terms of material decomposed the energy released is only a fraction of that released in the latter process. Either because of the lack of sufficient energy or because of the formation of poisonous materials by the process, intramolecular respiration will not generally support growth or even life for any considerable period. Some bacteria are able to live and grow only in the complete absence of free oxygen and are known as obligate anaërobes. They decompose nitrates or sulphates as a source of oxygen or ferment organic material as a source of energy Organisms that can grow either in the presence or absence of free oxygen are known as facultative anaërobes. All other organisms thrive only in the presence of free oxygen, although they continue a modified respiration in its absence.

Normal respiration consists essentially of four independent processes: first, the absorption of oxygen: second, the union of oxygen with the substances to be oxidized; third, the decomposition of these substances, with the formation of various end products, differing according to circumstances; fourth, the elimination of these products. The intensity of respiration in plants varies greatly with different plant groups, different individuals of the same species, different organs of the same individual, and different stages of development of the same organ Succulents and shade plants have low respiratory rate, while many fungi show more intense respiration than warm-blooded animals. Flowers, young organs, germinating seeds, and buds have more intense respiration than mature roots, stems, and leaves. Sufficient reduction of oxygen reduces normal respiration or even induces intramolecular respiration. Very slight reduction is thus effective in many seeds that are already limited in oxygen supply by membranes of slight permeability, while reduction to one-fifth or less of the normal atmospheric pressure is necessary in other organs. Under increased pressure the results differ according to the duration of exposure. For a short time plants may respire normally at two to six atmospheres of pure oxygen. Under a longer exposure to such pressures respiration is likely to be retarded. Variations in temperature, which are frequent in nature, exert a marked effect upon the intensity of the process. Within certain limits this follows the Van't Hoff law, showing a rise of two to three fold for each 10° C. rise in temperature. At certain higher temperatures, varying from 20° C. to 40° C. in the forms studied, an inhibitory effect of temperature sets in, which increases with time and more or less counteracts the accelerating effect. As the temperature rises, this time factor becomes more prominent. This critical point is higher in starchy than in protein-rich seeds and in tropical than in temperate forms. The rate of photosynthesis, growth, geoperception, and other plant processes is similarly modified by temperature. This probably means that the rate-determining phase of these processes is a typical chemical reaction, such as occurs in a test tube. The nature of the time factor is not known, but it may be a coagulation of cell proteins or some similar process.

Intramolecular Respiration. The exclusion of oxygen from plants which normally use it produces a profound disturbance of the usual metabolism, as shown by the fact that the end products of respiration, instead of being chiefly carbon dioxide and water, are alcohol, hydrogen, organic acids, etc. For most plants a period of intramolecular respiration seems to be a time to be tided over, growth ceases, and most other functions are suspended. After poisonous materials have accumulated to a certain extent death ensues. Therefore at high temperatures, which accelerate the process, intramolecular respiration suffices to maintain life for a shorter time than at low temperatures. See FERMENTATION

RESPIRATION, ORGANS AND PROCESS OF. The two great objects of respiration are: (1) to supply that amount of oxygen to the body which is essential to its economy, and (2) to remove the carbon dioxide which has been produced as a waste product. We may consider the anatomical details of the respiratory process in man and mammals under three different heads. First, there must be a special respiratory organ, the lungs, affording an immense extent of internal surface, covered by a vascular network, through which the blood flows in innumerable minute streamlets, only separated by an extremely thin membrane from the atmospheric air that has been inhaled; secondly, there must be such an arrangement of the circulating system that fresh blood may be continually driven through the lungs and then onward to the general system; and thirdly, there must be provision for the frequent and regular change of air contained in the lungs. The special organs of respiration consist of the larynx, the trachea, the bronchi, and the lungs. For a description of the first two, see LARYNX; TRACHEA.

The two bronchi resemble the trachea in structure except that the incomplete rings are distributed on all sides of the tubes. The bronchi on entering the lungs divide into smaller and smaller branches until finally each minute branch terminates in a pulmonary lobule. The smaller bronchi, as they are called, lose their cartilaginous rings, and the circular or transverse muscular layer forms a distinct coat. The mucous membrane is very delicate and lined with ciliated epithelium. Within the lobules of the lung the smaller bronchi divide still further into more minute branches, and their structure becomes more delicate, until at last they consist of only a thin membrane lined by a single layer of squamous epithelium and finally terminate in small saclike dilatations which are the air cells of the lungs. These air cells are from $\frac{1}{250}$ to $\frac{1}{300}$ of an inch in diameter. Their walls are lined by a single layer of flattened cells The air vesicles of one lobule do not communicate with those of another nor even with those of adjacent intercellular passages, as a rule. Therefore any obstruction of a bronchus cuts off the supply of air to the lobule beyond. Elastic tissue fills in the space between the air cells, and within this elastic tissue ramifies a dense network of capillary blood vessels. It is here that the interchange of gaseous elements between the atmosphere and the blood takes place.

The pulmonary lobules are bound together by connective and elastic tissue to form larger structures called lobes. Of these lobes the right lung presents three and the left two. Each lung is enveloped by a serous covering, the pleura, which is reflected from the lung at

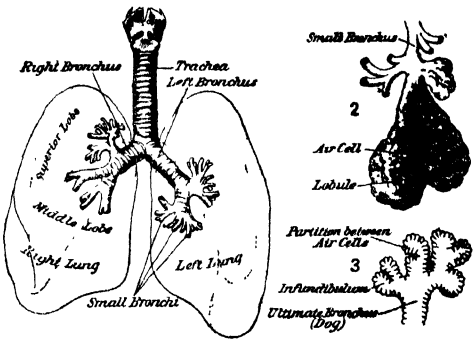
the point where the bronchus and great blood vessels enter and passing outward line the cavity of the chest. (See PLEURA; PLEURISY.)

In consequence of the great number of air cells which constitute their substance (over 600,000,000, it has been calculated), the lungs (except in the fœtal state, when no air enters them) are the lightest organs, in relation to their size, in the body. Although their bulk is so great that, with the heart, they occupy almost the whole of the cavity of the chest, they weigh only about three pounds and a half in men and two pounds and three-quarters in women. Their color varies at different ages. At birth they are of a pinkish-white tint, in adult life they are of a slate color and present a mottled appearance, and in old age they become of a still darker tint. The polygonal markings which are seen on the surface correspond to the outer surface of the lobules already noticed. Their shape is adapted to that of the cavity in which they are lodged, each lung being conical in form, with its apex rising into the neck, while its base, which is broad and concave, rests upon the convex surface of the diaphragm; and between the two lungs lie the heart and the great vessels that proceed from it. During life, except in certain diseases, as, e.g., pericarditis (q.v.), the inner margins of the lungs nearly overlap the heart, leaving only a roundish space of that organ, less than 2 inches in diameter, uncovered, while their lower borders extend to the cartilages of the ribs and fit into the angle formed between those cartilages and the diaphragm.

For the method by which the blood is perpetually changed in the lungs, see CIRCULATION.

For a description of the shape and framework of the chest, see CHEST. The chest, or thorax, is so constructed as to be capable of enlargement in height (vertically), in depth (or from the front backward), and in width (or from side to side). Its height is increased mainly by the descent of the diaphragm and to a certain extent by the elevation of the ribs and the widening of the intercostal spaces, while its depth and width are increased by the elevation of the ribs, which carry forward and elevate the breastbone (or sternum), especially at its lowest end, and are slightly rotated on an imaginary axis, joining their extremities, by which their central portion is raised and slightly removed from the mesial plane of the chest. It is only in forced or deep inspiration that all these means of enlarging the chest are called into play. An ordinary inspiration is attended in men with very slight elevation of the ribs (about $\frac{1}{20}$ of an inch), while in women the elevation is much greater, especially in the upper ribs, the cause of this difference in the sexes probably lying in the narrower waist of the female requiring a compensation in the upper part of the chest. There are three varieties of ordinary respiration, viz., (1) abdominal, or that chiefly effected by the diaphragm and seen in the motion of the walls of the belly; (2) costoinferior, or that in which the seven lower ribs are observed to act; and (3) costosuperior, or that effected in a considerable degree by the upper ribs. The first variety occurs in infants up to the end of the third year; the second in boys after the age of three and in men; and the third in adult females.

The following points in connection with the respiratory movements require notice. Every complete act of respiration is divisible into two parts, viz., (1) inspiration and (2) expiration. Between these acts there is a short pause, not always observed. After expiration there is a long pause. The act of expiration is always more prolonged than that of inspiration, the former being to the latter in the ratio of 12 : 10 in adult males and as 14 : 10 in children, women, and aged persons. The number of respiratory acts performed in a minute varies at different ages. At birth there are 44 respirations in one minute; at 5 years of age, 26; from 15 to 20, 20; from 20 to 25, 18.7; from 25 to 30, 16; from 30 to 50, 18.1; so that from 16 to 20 may be taken as the ordinary range for healthy adults. The average ratio which the number of respirations bear to the number of pulsations in a given time is about 1 : 4½, and if there is any great deviation from this ratio there is probably some obstruction to the aëration of the blood or some disorder of the nervous system.



When the lungs have been emptied as much as possible of air by the most powerful expiratory effort, they still contain a quantity over which we have no control and which may be estimated at about 100 cubic inches. To this portion of the contents of the lungs the term "residual air" is applied. In addition to this residual air physiologists distinguish, in connection with the respiratory process, reserve air, which is that portion which remains in the chest after an ordinary gentle expiration, but which may be displaced at will; breathing or tidal air, which is the volume that is displaced by the constant gentle inspiration and expiration; and complemental air, or the quantity which can be inhaled by the deepest possible inspiration, over and above that which is introduced in ordinary breathing. The greatest volume of air that can be expelled by the most powerful expiration, which is obviously the sum of the reserve, breathing, and complemental air, is designated as the vital capacity. The average inspiration in a healthy man at rest is about 30 cubic inches, and this increases with exercise of any kind. When we consider that the amount of air taken in at each respiration is only about one-seventh the capacity of the lungs, we see how slowly the air is renewed; but the law of the diffusion (q.v.) of gases here comes in play, for, the air in the air cells and finer tubes being charged by the respiratory process with a great excess of carbonic acid, as compared with the inspired air contained in the larger tubes, a diffusion of the carbonic acid necessarily takes place in the outward direction, while the oxygen from the air, or the air itself, similarly diffuses itself in an opposite direction, towards and into the air cells themselves. The total amount of air which passes through the lungs in 24 hours must obviously vary with the extent and frequency of the respiratory movements. The total daily amount for a person at rest is 686,000 cubic inches. This quantity is largely increased by exertion.

The alterations in the inspired air effected by respiration consist essentially in the removal of a portion of the oxygen and its replacement by carbonic acid. The amount of carbonic acid in the expired air varies inversely with the number of respirations; it reaches 5.5 per cent (or more) when the respirations are only 6 in

the minute, while it falls as low as about 2.6 per cent when the respirations are 96 in the minute. About 4.35 per cent of carbonic acid is, on an average, added to the air in ordinary respiration, while about 4.782 per cent of oxygen is removed, the actual diminution of bulk of the expired air (after the removal of the moisture obtained from the lungs) being about one forty-fifth of its volume. Hence, unless where there is free ventilation, the air in an apartment containing men or animals must soon become vitiated by containing a great excess of carbonic acid (for ordinary atmospheric air contains only about one part of carbonic acid in 2500 parts) and a deficiency of oxygen. The absolute quantity of carbonic acid (and consequently of carbon) exhaled in 24 hours is liable to great variations, caused by the temperature and moisture of the air, age, sex, muscular development, the nature and quantity of the food, muscular exercise, sleep, state of health, etc. Smith calculated that an adult man in a state of rest exhales in 24 hours an amount of carbonic acid equivalent to 7.144 ounces of carbon, and he estimated that it should be increased to 8.68 and 11.7 ounces for nonlaboring and laboring persons respectively at their ordinary rate of exertion; that the total amount of carbonic acid is greatly increased by external cold and diminished by heat; that it is increased by a moist and diminished by a dry atmosphere; that it increases in both sexes to about the thirtieth year, when it remains stationary for 15 years, after which it diminishes; that at all ages beyond eight years it is greater in males than in females and that it increases during pregnancy; that it is greater in robust than in slender men, the quantity of carbon expired per diem to each one pound of bodily weight being 17.07, 17.51, and 17.99 grains at 48, 39, and 33 years of age respectively; that it is greatly increased by eating and is diminished by fasting; that it is increased by muscular exertion; and that it is diminished during sleep. See MUSCULAR FORCE.

The nitrogen of the air plays no essential part in the process of respiration. The amount of watery vapor with which the exhaled air is saturated may range from about 6 to 27 ounces in 24 hours, its usual range being between 7 and 11 ounces. It is not pure water, but holds in solution a considerable amount of carbonic acid and albumenoid materials. See BRONCHITIS; PNEUMONIA; TUBERCULOSIS.

The anatomical divisions of the lungs, known as lobes, are composed histologically of an enormous number of little lobes or lobules. Each lobule is separated from surrounding lobules by connective tissue, and the lobules which come to the surface of the lung are often distinguishable as little polygonal areas. Each pulmonary lobule consists of a single terminal bronchus and the group of air cells and spaces connected with that bronchus. The terminal bronchus on entering a lobule divides into several branches known as alveolar ducts. These open into considerably larger cavities called infundibula, from the sides of which the air sacs or air cells open out like alcoves. The terminal bronchus is lined by a single layer of ciliated columnar epithelium. Outside of this are some elastic fibres and thin irregular bundles of smooth muscle cells. As the alveolar ducts are approached the ciliated epithelium is replaced by lower epithelium of the nonciliated variety. In the alveolar ducts the epithelium is cuboidal and the elastic tissue and smooth muscle are greatly reduced in amount. In the infundibulum the epithelium consists mainly of

1, trachea and bronchi; 2, small bronchus, showing air cell and lobule, 3, ultimate bronchus of dog.

large flat nonnucleated cells known as respiratory epithelium. Among these are scattered smaller polyhedral cells which are remains of fœtal life and are called embryonal cells. Elastic tissue forms the supporting framework of the air sacs and forms a distinct ring around the mouth of each sac. In addition to the elastic tissue there is usually a small amount of fibrous connective tissue and some connective tissue cells surrounding the air sacs. Besides the parts just described, which may be considered as the parenchyma of the lung, there are seen in all sections of lung tissue bronchi of various sizes. The smaller bronchi are lined with a single layer of columnar ciliated epithelium lying upon a basement membrane. Beneath the latter is the stroma of the mucous membrane, outside of which is a circular layer of smooth muscle, the whole being surrounded by a connective tissue or fibrous coat In the medium size and larger bronchi a distinct submucous coat is present in which are embedded the acini of mucous glands, while in the fibrous coat are situated various-sized plates of hyalin cartilage. In the largest of the bronchi the epithelium, instead of consisting of a single layer, is made up of several layers, and there is an increase in the thickness of the muscularis mucosæ and of the fibrous coat.

The blood vessels of the lung belong to two distinct systems: one, the bronchial system, is for the nourishment of the lung proper; the other, the pulmonary system, is for the purpose of exposing the blood to the air in the lungs. Both systems of vessels enter the lung at the hilus, accompanying the large divisions of the bronchus. Within the lung the pulmonary system of vessels gives off branches which correspond to the divisions of the bronchi and, on reaching the septa between the infundibula, break up into an extremely rich network of capillaries which surround the air sacs. At the margins of the air sacs the blood from the capillary network enters the radicles of the pulmonary veins, which accompany the arteries to the surface of the lung. The bronchial system of vessels accompanies the bronchial tubes and supplies capillary networks to them and to the other structures of the lung. The lymphatics of the lung, like the blood vessels, con-

sist of two sets. One of these originates in the lymph spaces of the interlobular connective tissue and in the subpleural lymph spaces, communicating by means of the latter with the surface of the pleura. The second set, the bronchial lymphatics, originates in the subepithelial lymph spaces of the bronchi, which communicate with the mucous surfaces of the bronchi and air sacs. From these spaces definite lymphatic channels are formed which follow the blood vessels to the surface of the lung and pass thence by means of a few large trunks to the bronchial lymph glands. The nerves of the lung come from both cerebrospinal and sympathetic systems. The main nerve trunks enter the lung at the hilus and follow the branchings of the blood vessels and the bronchi. On arriving at the smaller bronchi the nerves break up into fine nonmedullated fibrils which pass to the muscular tissue and to the mucous membrane. Consult R. W. Allen, *Bacterial Diseases of Respiration* (Philadelphia, 1913), and H. H. Janeway, *Respiration* (New York, 1915). See BIRD, *Respiration in Birds;* CHEYNE-STOKES RESPIRATION; PULMOTOR.

RESPIRATORY SOUNDS. Sounds produced during inspiration and expiration as perceived by auscultation, either by placing the ear upon the chest or through the medium of the stethoscope (q.v.). When the ear is placed upon the chest of a healthy adult, a soft, rustling sound is heard, comparable to the sighing of a gentle breeze among the leaves This sound is louder and more marked during the inspiratory act, which is in health longer than expiration in the ratio of 6 to 5. To this sound the name "vesicular murmur" has been given. In certain areas of the chest, where the large bronchi are nearer the surface, viz., over the sternum, the junction of the first costal cartilage with the sternum, and a diamond-shaped space at the back in the middle line, the sound becomes tubular and higher pitched, and expiration and inspiration are of equal length. This is called bronchial breathing and is significant of disease when it occurs elsewhere than over the areas above indicated. Where these two sounds shade into each other, bronchovesicular breathing is heard.

In pathological conditions of the lungs the vesicular murmur undergoes many important modifications. It is, e.g., diminished or completely obliterated in pleurisy (q.v.) with effusion and in pneumothorax; it becomes louder and higher in pitch over consolidated lung tissue such as occurs in pneumonia and pulmonary tuberculosis (q.v.). One of the earliest physical signs of phthisis is a prolonged expiratory murmur, and this alteration of the normal rhythm is also characteristic of asthma and emphysema (q.v.). Interrupted breathing, sometimes called cogwheel respiration, is heard in healthy but nervous individuals, but in disease it is caused by the breaking of the column of air passing through the bronchioles by tenacious mucus or by the expansion of different lobes at different times.

Certain adventitious sounds to which the generic name "râles" is applied are heard in disease and are produced either in the bronchial tubes or air vesicles. Dry râles are whistling, squeaking sounds, caused by the passage of air through bronchial tubes narrowed in places by swelling of the lining mucous membrane as in bronchitis, or by spasm, as in asthma, or by tough adherent mucus. Moist râles are produced by the expansion of previously closed air cells or by the passage of air through fluid in the bronchial tubes or in a cavity. These are heard in tuberculosis, the resolving stage of lobar pneumonia, pulmonary œdema, etc. Metallic tinkling is a sharp, quick sound resembling that produced by striking a glass vessel with a pin. Its occurrence gives evidence of the presence in the lung of a cavity of considerable size containing air and surrounded by firm walls. A friction sound is produced by the rubbing together of the visceral and parietal layers of the pleura when rough from inflammation, and is indicative of pleurisy. Consult Austin Flint, *A Manual of Auscultation and Percussion* (Philadelphia, 1912). See AUSCULTATION; PECTORILOQUY.

RESPIRATORY SYSTEM, COMPARATIVE ANATOMY OF THE. The system of organs that have the function, in the animal body, of taking in oxygen from the surrounding mediums (water and air) and of getting rid of carbon-dioxide gas and certain other excrementitious products. In Vertebrata these organs are either gills or lungs. In invertebrates the skin always functions, more or less, as a respiratory organ, and in addition various other organs subserve this function also. Whatever form or position the respiratory organ may assume, it must be richly supplied with blood vessels so that the blood containing carbon dioxide may come in close relation with the surrounding medium. No organ may be spoken of as a respiratory organ which has not this vascular apparatus. Specialized respiratory organs do not appear in the animal kingdom until the segmented worms are reached, and even in many of the segmented worms no specific respiratory apparatus is developed. The integument of lower forms and sometimes the wall of the intestine, when this organ is present, perform the respiratory function; the integument is better able to do so, since it is the part that comes most intimately in contact with the surrounding media.

In echinoderms there are no respiratory organs that are homologous throughout the phylum. In holothurians this function is performed by the respiratory tree, a mass of delicate branched tubules which open into the cloaca; by the oral tentacles; and by the entire body wall. In the other forms various other organs perform this function.

Mollusks, as a rule, have one (in a few cases more than one) pair of breathing organs, the gills, which are covered and protected by the mantle. In some forms this gill is wanting and in others it is functionally replaced by other and phylogenetically newer organs. Blood flows into these gills and after taking in oxygen from the water it flows back again, first to the heart and then to all parts of the body. The lamellibranch gills appear double on account of the strong development of the two rows of branchial leaflets, and in some mollusks increased surface is obtained by a folding of the leaflets. Scaphopoda and many Gastropoda do not possess true gills. In certain cases they are replaced by adaptive gills. The latter may be delicate leaflets forming a rosette around the anus, or folds to the right and left in the mantle cavity, or cerata, the dorsal finger-like processes of Nudibranchiata. Some Pulmonata have become adapted for aërial breathing. In this case

the mantle cavity is richly supplied with blood vessels in its dorsal wall and gains a respiratory aperture, the so-called lung.

Respiration in all Crustacea takes place in the outer integument. In small Crustacea there are no specially developed respiratory organs, and respiration is performed by the entire body surface. In the large Crustacea certain parts of the body are adapted to perform this function more actively than others. To fit such parts of the body for a respiratory function folds of the integument arise, and the soft skin of the folds is functional in respiration. When this fold is transformed into a hard shield, it serves to protect the delicate breathing organs. The function of respiration is performed in most Crustacea by the thoracic limbs. Some of the crabs live more or less on land and are adapted to retain water in the branchial cavity and to breathe air directly. In the latter case the part of the branchial cavity that functions as a lung has its integument modified into branched tufts which project into the air cavity and are well provided with vascular organs.

The respiratory organs of insects are segmentally arranged air-conducting tubules, the tracheæ, which connect with the exterior by means of segmental openings, the stigmata. These openings are often guarded by bristles or tufts to keep out foreign particles. Internally the tracheal tubes branch and subdivide again and again and penetrate all through the tissues of the body. The tracheæ are lined by chitinous spirals to keep the tubes open. This chitin is continuous with the chitin of the exoskeleton and is shed with the latter.

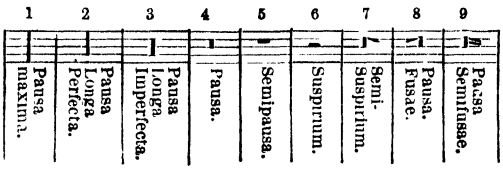
In *Amphioxus* more than the first half of the length of the alimentary tract is devoted to the purposes of respiration, since its walls are provided with gill slits. This may be called the respiratory part of the alimentary tract (prosenteron) in contradistinction to the remainder, hinder portion, the digestive part. Gill slits to the number of 100, more or less, are borne by it. In Ammocœtes of the Cyclostomi, there is a muscular fold at the posterior end of the branchial part of the œsophagus. In *Petromyzon* that part of the œsophagus which contains the gills is entirely cut off from the alimentary tract and the cut-off end of the latter grows forward above the gill portion to join the mouth cavity. Thus two canals pass backward from the mouth. From Elasmobranchii onward the gills are in close relation with the skeletal parts of the visceral arches. As a rule teleosts possess four gill arches, but certain rudimentary gills on the mandibular and hyoid arches indicate that fishes formerly possessed more gill arches than at present. Fishes take in water through the mouth and, by a constriction of the latter, force it out through the gill slits. During the process of breathing the gill arches rise and fall. The Dipnoi, as the name indicates, breathe both by gills and by lungs. The lung sac of the Dipnoi is an unpaired bilobed sac.

Lungs. The air-bladder and lungs have a similar development and the latter has developed from the former. Both are outgrowths of the alimentary tract; the air bladder is usually formed on the dorsal, and the lung on the ventral, side, however. The point at which the air bladder arises from the œsophagus is not a fixed one, and the duct which connects the bladder with the œsophagus may remain open, may be reduced to a solid strand, or may eventually disappear altogether. In the last case the air bladder probably gets its contained gas from its own wall. The air bladder always lies above the alimentary tract. In a few cases it is paired. It may be transversely constricted to form several divisions, or cœcal processes may be present. The internal surface of the air bladder of fishes may be spongy, a condition similar to that of the lungs of Dipnoi and Amphibia. The lungs of some of the Dipnoi show posteriorly a paired condition, although anteriorly there is only one part. The lungs of certain Amphibia (*Menobranchus* and *Proteus*) are lower in development than those of the Dipnoi in so far as their internal surface is smooth In reptiles and in the other vertebrates the form of the lung is determined by that of the body. The lungs show a branched system of bronchi. In this respect the lungs of crocodiles and some other forms show a decided advance over those of Amphibia. The lungs of birds (see BIRD) are in connection with large sacs, the air sacs. These air sacs fill the interstices in the body cavity, pass between the muscles, under the skin, and even into the hollow bones.

In man the lungs of the two sides are not symmetrical; the right lung has three lobes, the left two. They are connected with the exterior by the air passages composed of the bronchial tubes, trachea, larynx, and windpipe This system of organs arises on the ventral side of the œsophagus as a duct, and constricts off to form a distinct tube. The separation begins anteriorly. The lungs arise as lateral buds at the posterior end of the furrow. Cartilaginous supports first arise in Urodeles. Definite tracheæ appear in Sirenia, Amphiuma, and Gymnophiona. The cartilaginous bands take on the form of half rings first in the Gymnophiona A differentiated larynx appears in the Anura, is regulated by muscles, and has vocal cords The larynx of reptiles makes no advance over that of Anura, but in crocodiles and turtles the larynx is embedded in a depression of the hyoid The thyroid cartilage of mammals is supposed to have been derived from a part of the hyoid In birds two larynges are present, the lower of which, the syrinx, is the functional voice organ and is restricted to birds alone.

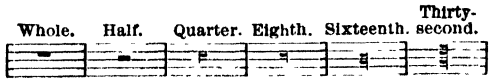
Wiedersheim, *Comparative Anatomy of Vertebrates*, English translations by W. N. Parker (3d ed., ib., 1907); Parker and Haswell, *Text-Book of Zoology* (2 vols., ib., 1910); T. B Futcher, *Outlines of Physical Diagnosis of the Circulatory and Respiratory Systems* (Baltimore, 1915).

RESPOND'ENT (from Lat. *respondere*, to answer, from *re-*, back again, anew + *spondere*, to promise). In legal procedure, a party who is called upon to answer in proceedings against him in certain courts. A person who is sued in an admiralty court or in a court of chancery or equity is known as the respondent. In this sense the term corresponds to the term "defendant" in suits at common law. The term is also applied to one who opposes an appeal, and in that sense it is the opposite of appellant. In the English divorce courts the defendant is known as the respondent. See APPEAL.



RE'SPONDEN'TIA (Neo-Lat., from Lat. *respondere*, to answer). In maritime law, a loan

of money on the whole or a part with maritime interest when the cargo is safely delivered at the port to which it is consigned. A respondentia bond is commonly given as evidence of the contract. The lender of the money assumes the risk that the goods may be lost at sea, and if such casualty occurs he loses the amount he has advanced. If there is a partial loss the lender is entitled to have the goods which are saved sold for his benefit. The loan is practically only on the personal security of the borrower, as the goods may be sold by the latter free from any lien at any time during the voyage or upon their arrival. The advantage which accrues to the lender in consideration of the unusual risk he assumes is that he may contract for practically any rate of interest which the borrower is willing to pay. See BOTTOMRY BOND; USURY. Consult the authorities referred to under ADMIRALTY LAW.



RESPONSE IN PLANTS. Plants are popularly thought of as more or less inert organisms. On the contrary, they respond to a great variety of stimuli (see STIMULUS) by a change in growth rate (see GROWTH IN PLANTS), a change in size, or some appropriate movement (q.v.).

RESSEL, rĕs'sel, JOSEPH (1793–1857). An Austrian inventor, born at Chrudim, Bohemia, and educated at Vienna and at Mariabrunn. In the latter place he studied forestry, and from 1817 until his death he held various posts in the Austrian Department of Forestry, being stationed for some time at Triest. Ressel was an able mechanic and invented several machines. His claims to the discovery of the screw propeller, which he did not patent, owing to an unfortunate accident at the trial trip of the screw steamboat, rival those of Sauvage, Ericsson, Smith, and Wilson. Consult Reitlinger, *Joseph Ressel* (Vienna, 1863).

REST (AS. *rest, ræst*, Goth., OHG. *rasta*, Ger. *Rast*, rest; ultimately connected with Skt. *ram*, to rest, to rejoice). In music, an interval of silence occurring in the course of a movement between one sound and another. With the use of mensurable music (q.v.) rests began to be represented by fixed signs, and the following values were one after another decided on:

Ultimately the tails of the shorter notes were reversed and thus the following principal rest characters came into use:

For rests of a number of bars it is now usual to draw one or two oblique lines across the staff and write on them in figures the number of measures during which the voice or instrument is to be silent; thus  in common time, denotes a rest of five  whole notes. A rest, like a note, may be prolonged by one or more dots.

REST CURE. A system of treatment inaugurated about 1870, after the recognition of the success of Prof. Samuel Jackson, by Dr. S. Weir Mitchell (q.v.), of Philadelphia. It is calculated "to renew the vitality of feeble people by a combination of entire rest and excessive feeding made possible by passive exercise obtained through the steady use of massage and electricity." The cases most benefited by such treatment are those of women who are nervous, thin, and anæmic, partial or entire invalids. Seclusion from relatives and friends; absolute rest in bed for six weeks or more; neither reading, writing, nor sewing, and often not raising the hand or turning over in bed without aid; massage of the entire body except the face every day for six weeks; the use of the induction current with slow interruptions over the whole of the body except the face and neck during 40 to 60 minutes each day; together with large quantities of milk, cocoa, and malt extract, combine to make up the treatment. While rest cure is especially suitable to the thin, it also benefits cases of fat anæmia and the large majority of neurasthenics. It has also been of great value in indigestion and alcoholism and some early cases of tuberculosis. Rest cure is employed in modified form by many physicians. Consult S. W. Mitchell, *Fat and Blood* (new ed., Philadelphia, 1905), and F. X. Dercum, "The Rest Cure," in *Modern Treatment*, edited by H. A. Hare (ib., 1910).

REST-HARROW. A popular name for several species of European herbs and subshrubs of the family Leguminosæ. Common rest-harrow (*Ononis arvensis*) is sometimes abundant in neglected pastures, but is easily controlled by cultivation. The roots of *Ononis spinosa* are medicinal.

RESTIF DE LA BRETONNE, rĕs'tēf' de là bre-tŏn', NICOLAS EDMÉ (1734–1806). A French novelist, nicknamed by Grimm the Gutter Rousseau, born in Sacy. The discovery of his love letters to another woman than his wife in 1765 led to the first recognition of his literary talent. From the first his fiction was the work of observation and largely of personal experience. Its success was gradual, but steady. *Le pied de Fanchette* (1769) made him known, *Le paysan perverti* (1775) made him famous and sought by distinguished men. Of other writings *Monsieur Nicolas* and the 42 volumes of *Les contemporaines* (1780–85) are noteworthy.

RESTIGOUCHE, rĕs'tē-gōōsh'. A river, 200 miles long, composed of five branches (like the hand, whence its name), forming for about 50 miles the boundary between the provinces of New Brunswick and Quebec, Canada (Map: New Brunswick, C 1). It empties into Chaleurs Bay, an arm of the Gulf of St. Lawrence. The last 18 miles it is navigable for large ships.

RES'TITU'TION (Lat. *restitutio*, from *resti tuere*, to restore, from *re-*, back again, anew + *statuere*, to place, from *stare*, to stand). In law, return to the rightful owner of property which has been unlawfully detained by another. The term is applied alike to cases where the property has merely been converted to the use of some one under a claim of title and where it has been stolen. In the United States, where there is doubt as to the identity or right to possession of the property, the issue should be decided by a replevin action. (See EXECUTION; REPLEVIN.) The term is also applied to the restoration of a part of a cargo which has been lost by jettison. See MARITIME LAW.

RES'TORA'TION (Lat. *restauratio*, from *restaurare*, to restore, from *re-*, back again, anew + **staurus*, Gk. σταυρός, firmly fixed stake; connected with *stare*, to stand, Skt. *sthāvara*, fixed, *sthā*, to stand). A term employed in the history of England and France in connection with the reëstablishment of monarchical government. In England it is applied to the accession of Charles II. In France the term is applied to the accession of Louis XVIII in 1814, after the abdication of Napoleon (First Restoration), and after the Hundred Days in 1815 (Second Restoration).

RES'TORA'TIONISTS. A sect which, under a new name, has revived a very ancient doctrine, which has found advocates at all times since the days of Origen (q.v.). One of the most remarkable doctrines of that father was his belief of a general *apokatastasis*, or restoration of all things, in which, after a purgation proportioned to the various moral conditions of their souls at the time of death, all men, however wicked, and all the evil angels, even Lucifer himself, would be restored to the favor of God and reunited to Him in heaven. This doctrine was condemned at the time and has since been repeatedly rejected by the churches of the East as well as of the West, though occasionally appearing, as in Tauler and some of the other mystics. The doctrine has been renewed in more than one form since the Reformation and forms the special basis of Universalism (q.v.). The particular title of Restorationists was given in the United States to the followers of the Rev. Hosea Ballou (q.v.), who, in addition to the tenet above explained, held that all retribution is confined to this life and taught that at the resurrection all men will be admitted to everlasting happiness. (See UNIVERSALISM.) Within the last century emphasis on the fatherhood of God has caused the doctrine to appear in various churches, as at least a possible view. Consult: F. W. Farrar, *Eternal Hope* (London, 1878); *Progressive Orthodoxy*, by Professors of Andover Seminary (Boston, 1886); E. H. Plumtre, *The Spirits in Prison* (London, 1886); G. A. Gordon, *Immortality and the New Theodicy* (Boston, 1896).

RESTORATION OF BUILDINGS. The movement for the care, repair, and preservation of ancient buildings as historic monuments, which began somewhat before the middle of the nineteenth century, has raised many perplexing questions as to the extent of the permissible alterations of their present condition. "Restore the building to its original aspect when first completed" represents one extreme answer to these questions, but this must usually mean a complete reconstruction, destructive of all historic interest. Moreover, how often can the "original aspect" be determined? At the other extreme is the theory of the least possible alteration of present condition, with only such repairs as are essential to preserve it from ruin. In the case of buildings added to or remodeled at different periods, in different styles, the difficulty of distinguishing between excrescences to be removed and historic additions to be retained is very great, and the question of style for the rebuilding of ruinous parts of such buildings is a further complication. These questions have been variously answered in the restoration of nearly all the cathedrals, great churches, and castles of Europe by such restorers as Sir G. Gilbert Scott (q.v.) in England, E. E. Viollet-le-Duc (q.v.) and M. Selmersheim in France, and others in Germany.

RESTORATION OF PAINTINGS. To restore a painting to its original condition is a delicate operation, requiring great knowledge and skill. By the operation of ignorant restorers of the past many of the most important paintings have been destroyed; indeed, it is a question whether restorers have not inflicted more damage than time itself. In former times the process was chiefly one of repainting, and it was then that the chief damage was done, even though the artist himself was often a man of ability. One of the most difficult tasks of the modern restorer is to remove these outer coatings of paint.

The first step in the process of restoration is to clean the picture. The usual process is to dissolve the varnish by means of brandy, weak alcohol, or some similar substance applied with the sponge, oil also being frequently applied to prevent deleterious action upon the colors. In Germany the process invented by the celebrated Bavarian chemist Max von Pettenkofer (q.v.) is often applied; this consists in subjecting the painting to cold fumes of alcohol. Unvarnished paintings are in like manner carefully washed with brandy, vinegar, or some similar substance.

The transferring of a painting from a damaged canvas, panel, or wall is effected by gluing it to a paper plaque fastened on gauze. The canvas or wood is then carefully removed and the painting is glued to a new canvas, after which the paper is removed from the surface of the painting. In case of a fresco the paper is rolled upon a cylinder while the plaster is being removed with a chisel. The retouching of the parts of the painting damaged during the restoration is an important process, which should be intrusted to most skillful hands. Consult Secco-Suardo, *Il restauratore dei dipinti* (Milan, 1894), and M. L. Holyoake, in *Magazine of Art* (London, 1900).

RESTRAINT OF TRADE, CONTRACTS IN. It has always been regarded as contrary to the policy of the common law that one should be deprived or should be permitted to deprive himself of the right to engage in business or trade, and all contracts entered into for that purpose have with certain limitations been regarded as illegal and consequently null and void. Thus, a contract that one would never engage in his business or trade within 10 miles of London was deemed valid and enforceable, but a contract not to engage in any particular trade or business in England for five years was considered illegal as against public policy. The later tendency of the courts is to test the validity of the contract by its reasonableness in view of all the circumstances of the case irrespective of any arbitrary rule as to time and space. The early decisions of the United States followed the early rule of the English courts. Later decisions recognize that the United States constitute practically one country for purposes of trade, and consequently do not hold contracts in restraint of trade invalid when the restraint extends over an entire State or, indeed, over nearly all of the United States. Contracts for the purpose of creating so-called corners in the market of any commodity of general or necessary use have always been held void as unlawfully restraining trade, and contracts unreasonably in restraint

of commerce are deemed void on the same principle. See TRUSTS.

Congress, acting under the constitutional power to regulate commerce, passed an act in 1887, known as the Sherman Act (26 U. S. Statutes at Large, 209), declaring that all contracts and combinations in restraint of interstate or international commerce are illegal and void. In construing this statute the United States Supreme Court has held that all contracts directly restraining commerce, interstate or international, whether such restraint be reasonable or unreasonable, are illegal, thus changing the common-law rule that the restraint must be unreasonable in order to invalidate the contract. In later decisions, however (the Standard Oil and Tobacco Trust Cases), the court has intimated that it should be governed by "the rule of reason," in effect reinstating the common-law rule. See COMBINATION; COMMERCE; CONSPIRACY; INTERSTATE COMMERCE; MONOPOLY; STRIKE; TRUSTS.

Consult J. B. Matthews, *Law of Covenants in Restraint of Trade* (London, 1893); Albert Stickney, *State Control of Trade and Commerce* (New York, 1897); A. J. Eddy, *Law of Combinations* (Chicago, 1901); John Lawson, *Monopoly and Trade Restraint Cases* (2 vols., ib., 1908); W. A Jolly, *Contracts in Restraint of Trade* (3d ed., London, 1914)

RESTREPO, rā-strā'pō, CARLOS E. (1868–). A Colombian lawyer and politician, born in Medellín. He was educated in literature, philosophy, and law in his native city and later distinguished himself in the practice of his profession. Early active in politics, he was elected to the national House of Representatives, of which body he served as President. In 1910 he was chosen President of the Republic; his administration was marked by peace and prosperity. Although decidedly anti-American at first, he later changed his attitude and endeavored to secure an adjustment of the disputes between the United States and Colombia.

RESTREPO, JOSÉ MANUEL (1780–1864). A Colombian historian and politician, born in Envigado. He joined the revolutionary movement in 1810 and was active in the cause of independence. He took an important part in the Congress of Cúcuta (1819) and became Secretary of Foreign Relations under the government established by the Congress. Later he served as secretary to Bolívar. He wrote *Historia de la revolución de la república de Colombia* (1827), a valuable work for the period of the revolution because of the author's part in many of the events described.

RESTRICTIVE COVENANTS. Covenants in conveyances which bind the purchaser and his successors in title to use the land conveyed thereby in some particular way or which prohibit them from making use of it for certain designated purposes. Common examples of such covenants are the restrictive clauses in deeds prohibiting purchasers from building beyond a fixed house line on the land, i.e., within a certain distance from the street, or prescribing the character of the buildings which they shall be permitted to erect thereon. Restrictive covenants create equitable easements in favor of the owner of the land for the benefit of which they are made, and "run with the land," i.e., continue to operate in favor of all subsequent owners of that land who buy with notice of the restriction. It is by restrictive covenants that the improvements on real estate in suburban towns are fixed. Consult H. C. Jones, *The Law of Easements* (New York, 1898), and Emory Washburn, *American Law of Real Property* (6th ed., 3 vols., Chicago, 1902). See COVENANT; EQUITABLE EASEMENT.

REST STICK. See MAHLSTICK.

RES'URREC'TION (Lat. *resurrectio*, from *resurgere*, to rise again, from *re-*, back again, anew + *surgere, surrigere, subrigere,* to rise, from *sub,* under + *regere,* to direct, rule). The restoration of man after death to the full possession of his powers and faculties. In one form or another this conception is found among Mazdayasnians, Jews, Christians, and Mohammedans. While the prevailing view has generally been that the dead will rise simultaneously on the last day, there are great religious teachers who have regarded the resurrection as taking place in the case of each person immediately upon death. The resurrection has been conceived of as an awakening from the sleep of death; a reanimation of the body; a restoration of the body by the coming together of the particles that constituted it at the moment of death; a creation of a new body in harmony with the perfected spiritual character; a clothing of the departed spirit with a spiritual body descending from heaven; or a development of the germ of a spiritual organism already existing within the physical body before death. Some have maintained that all men, regardless of nationality, religious belief, or character, will be raised from the dead, while others have held that only members of a particular nation, the adherents of a certain form of religion, or the possessors of a good character will be deemed worthy to share in the resurrection.

Whether the idea of a resurrection originated with Zoroaster, already existed before his time in Iran, or was developed by his disciples cannot be determined with certainty. In its most concrete form it is met in the later parts of the Avesta (q.v.) and in the Bundahish. Here all men are to be raised on the last day by the Saoshyant (q.v.), or Savior, and those who are living at that time are to be endowed with immortality, the bodies of the dead being brought together from the different elements in the course of 57 years. It is on the whole most probable that there existed a popular belief in a future resurrection already before the time of Zoroaster. The custom of leaving the dead in the field to be consumed by wild beasts, without building for them a house, goes back to extreme antiquity. While such a practice might seem to preclude ancestral cult and the hope for immortality, the unimpeded return of the body to the different elements of nature apparently made the worship of ancestral spirits less a matter of ceremony and, in connection with the idea of a coming destruction and renovation of the world, led the Iranian mind to expect a reconstruction of each human being from its constituent parts scattered among the elements. That this occurred at a very early period is rendered probable by the emphasis put upon the future life by such Iranian peoples as the Scythians and the Thracians, who must have left the common home at a remote epoch. We have positive evidence that this doctrine was taught in the Achæmenian period in a work of Theopompus, the historian of Philip of Macedon, used and quoted by Diogenes Laertius, Æneas of Gaza, and probably Plutarch. Herod-

otus and Xenophon probably also heard of it, though they emphasized only the belief in immortality on the part of the Persians.

In early Hebrew thought there is no trace of this conception. The third chapter of Genesis no doubt reflects the attitude of large circles in Israel; if man had been allowed to remain in the garden of Eden he might have continued his existence indefinitely by the magic virtue of the life-giving fruit; but as he was driven out of the garden, he returns to dust and is no more. Nevertheless the survival of ancestral worship and necromancy shows that to many minds there were exceptional personalities rising above the average lot of the shades in Sheol (q.v.), still possessing high rank, power over the living, and supernatural insight. The valley of bones in Ezek. xxxvii does not suggest, but rather precludes, familiarity with the doctrine of a resurrection. In Job xix. 25–27 the text has evidently suffered much in transmission, but the whole trend of the thought clearly shows that there can be no reference to either a life beyond or a resurrection. The possibility of such a return to life is emphatically denied in chapter xiv. The first reference in Hebrew literature to the resurrection is found in Daniel xii. 2, 3, written in 165 B.C. According to this passage some of those that sleep in the dust are to be raised. Evidently the Maccabæan martyrs and the apostates are intended. An apocalypse preserved in Isaiah xxvi declares that Yahwe's dead shall live and His dead bodies shall arise, for His dew is a dew of healing and the earth shall cast forth the dead. This may have been written in the time of John Hyrcanus. Whether all Israelites are meant is uncertain. Within the canonical Old Testament these are the only passages that show an acquaintance with the doctrine. How long before the year 165 B.C. it became known in Israel we have no means of determining. In the earliest part of the Book of Enoch, written c.108 B.C., there is an allusion to some who are neither slain on the judgment day nor raised from the place of torture (xxii. 13). The resurrection is apparently limited to righteous Israelites. This is clearly the conception in Enoch xci. 10, xcii. 3–5, written c.88 B.C.; in the Psalter of Solomon iii. 12, xiii. 11, xiv. 9, xv. 13, written between 63 and 48 B.C.; in 2 Macc. vii. 9, 14, 23, 29, 36, xii. 43, 44, written in the first century B.C.; and in the Testaments of the Twelve Patriarchs, Jude xxv, and probably originally in Benj. x. A number of apocalyptic works written apparently in the reign of Domitian seem to contemplate a universal resurrection. This is most clearly the case with 4 Ezra vii. 32; probably also with Baruch xlii. 7, l. 2, li. 1 (though in xxx the resurrection is limited to the just), and with Enoch li. In the Life of Adam and Eve the resurrection of the whole human race is clearly taught (x, xiii, xxviii, xli, xliii), the addition "all that are a holy people" in xiii being probably an interpolation; also in Sibylline Oracles ii. 214–237, written c.200 A.D. The prevailing view, however, in the Talmudic and Midrashic period was that the heathen would not rise from the dead, but that the resurrection would be only for the righteous. Whether this would include all Israelites was a mooted question, the opinion being frequently expressed that some classes would be excluded. Before the third century A.D. the resurrection is always a work of God Himself. But Rabbi Samuel taught in the name of Rabbi Jonathan that the righteous would raise the dead (*Pesachim*, 68). Later it was held by many teachers that the Messiah would raise the dead. The general opinion was that the resurrection would occur in Palestine. Even the Jews who had died outside of the Holy Land were supposed to be led through subterranean passages to Palestine, where they were to be raised (*Pesiktah rabbath* i). Many supposed that of the human body one bone would never molder into dust and that from this "almond of the spine," or *os sacrum*, the resurrection body would be formed (*Bereshith rabba* xxviii).

There probably never was a time when the belief in a resurrection was universally held in Israel. While it was championed in one form or another by the Pharisaic party, it was strongly opposed in many circles. It is not known or accepted by the authors of Ecclesiasticus, Judith, Tobit, and 1 Maccabees, and it is of course emphatically denied by Ecclesiastes. The Sadducees adhered to the old idea of Sheol and rejected the doctrine of a resurrection. The Samaritans seem to have maintained the same attitude in earlier times, though they subsequently accepted the doctrine (See SAMARITANS.) The Essenes cherished a view concerning the nature of the soul and the future life closely resembling that of the Pythagoreans, ultimately due to Indian or Persian influences, according to which the soul has existed before birth and will exist eternally after its bondage to the body is ended. A similar view was held by Jewish Gnostics. Where Greek thought prevailed the idea of immortality (q.v.) was accepted rather than that of a resurrection. This may be seen not only in the Wisdom of Solomon iii. 1–9, iv. 7, v. 16, vi. 20; 4 Macc. xvii 5, 18, xviii. 3; and Philo, *De Vita Mosis*, ii, 633; *De Abr.*, 385; *De Somn.*, 586; *De Migratione*, 407; but also in Palestinian works like Jubilees xxiii, xxv, and Slavonic Enoch lxv. 8, 9, 10, lxvi. 7. Even where the term was kept the idea of a resuscitation of the physical body was abandoned, as by Josephus (cf. especially *Bel. Jud.*, iii, 8, 5) for the thought of an endowment with a spiritual organism. As a result of contact with Arabic learning there was an unmistakable tendency to substitute the doctrine of a natural immortality of the soul for that of a resurrection of Israel only. Modern Judaism has been largely determined in this as in other respects by Moses Mendelssohn, whose work, *Phadon, oder uber die Unsterblichkeit der Seele* (1767), made a profound impression on his age.

The attitude of Jesus on this question cannot be determined with certainty. Aside from Luke xiv. 14, which, if genuine, shows that Jesus looked forward to a recompense at the resurrection of the just, there is but one saying of his recorded in the Synoptic Gospels that has any direct relation to the subject. This is found variously reported in Matt. xxii. 23–32, Mark xii. 18–27, and Luke xx. 27–38. Jesus evidently rejects the view of the Sadducees on the ground that they do not understand the Scriptures and fail to appreciate the power of God. On the other hand, he clearly does not accept the current Pharisaic doctrine of a resurrection on the last day, since he based his argument for the fact that the dead are raised on the words of Yahwe to Moses in which he speaks of himself as the God of Abraham, Isaac, and Jacob. The

point of the argument is that, according to the Scriptures, these patriarchs were addressed as living several centuries after their death, and therefore must have been raised from the dead; and the natural inference is that Jesus believed in a spiritual resurrection by which those to whom God stands in relation as their God are immediately after death raised into life to be in His presence forever. Concerning those who shall be accounted worthy to share in the resurrection, he further stated his conviction that they would neither marry nor be given in marriage, but be like the angels. His warning, "Fear ye him who is able after he has killed to slay both body and soul in Gehenna," also seems to indicate that he limited the resurrection to those who should be accounted worthy. See GEHENNA; HELL.

A new assurance of a resurrection to a blessed life beyond was given to those who became convinced that Jesus had been raised from the dead. Unless it can be proved that certain of the older Epistles ascribed to Paul are not genuine, there is positive evidence that not much more than 20 years after the death of Jesus a glorious figure appeared in a vision to Paul and was identified by him as the crucified Nazarene and that Paul had heard of similar visions seen by Peter, James, and others (1 Cor. xv. 4 8). This conviction revolutionized Paul's life and caused him to see in the resurrection of Jesus the guarantee of an eternal life and the sole reason for righteous conduct in this life While the important passage in 1 Cor. xv. contains no intimation of an empty tomb and cannot be pressed as proving a physical resurrection or an appearance to women, the earliest Gospels, Matthew and Mark, written in the main before the end of the first century, suggest that Jesus first appeared to his disciples in Galilee and that some women had found the tomb empty, but said nothing about this because of fear. The later Gospels, Luke and John, make Jerusalem the place of the first appearance of Jesus to his disciples and strongly emphasize the physical character of the resurrection body while ascribing to it functions impossible to a physical body

In the conflict with Gnosticism, which denied the resurrection, the Church found it necessary to give added emphasis to the resurrection of the flesh. Hence the earlier creeds, which simply affirmed a belief in a resurrection or an eternal life, were gradually changed into the formula "the resurrection of the flesh," found in the Apostles' Creed. Since the thought of a resurrection of the wicked as well as the good sporadically occurs in the New Testament (as in John v. 28, Acts xxiv. 15, Heb. vi. 2, Rev. xx 13), the idea of an interval between a first resurrection of believers and a second resurrection of the rest of mankind developed, and was especially cherished by those who looked forward to a thousand-year period of Messianic rule. See MILLENNIUM.

Through the influence of Greek philosophy the doctrine of the natural immortality of the human soul (see IMMORTALITY) became so important a part of Christian thought that the resurrection naturally lost its vital significance, and it has practically held no place in the great systems of philosophy elaborated by Christian thinkers in modern times.

The doctrine of the resurrection was adopted by Mohammed from Jewish or Christian sources and adhered to both by Sunnites and Shiites. It was subjected to grave doubts by Moslem thinkers in the times of the Bagdad caliphate, but is to-day generally accepted. See GOSPEL.

RESURRECTION. A sombre and powerful novel by Tolstoy (1899), treating of the problems of Russian life of to-day and arraigning especially the Russian judicial prison system.

RESURRECTION, THE. In Christian art Christ is usually represented as rising from the tomb bearing the banner of the resurrection, a red cross on a white ground, with the four soldiers on guard either asleep or stricken with terror. The early Christians treated the subject symbolically or allegorically, as in the story of Jonah. During the Renaissance it was treated by Fra Angelico (San Marco, Florence), Perugino (Vatican), Filippino Lippi (Munich), Sodoma (Naples), and Annibale Carracci (Louvre), and several times by Tintoretto (Venice). Among Northern artists it was best represented by the German engravers Schoengauer and Dürer and by the painter Rembrandt (Munich).

RESURRECTION PLANT. See ROSE OF JERICHO.

RESUS'CITA'TION (Lat. *resuscitatio*, from *resuscitare*, to raise again, revive, from *re-*, back again, anew + *suscitare*, to raise, from *sus-*, *sub-*, up, under + *citare*, to call, rouse). The revival of the apparently dead. The apparently dead to whom efforts to restore are of use are those asphyxiated by drowning, by breathing illuminating gas, or by suffocation, and those suffering from syncope or the effects of electricity. In syncope, or fainting, the head and heart should be lowered and the lower extremities elevated. Respiration may be excited by sprinkling the face with water and applying to the nostrils some pungent volatile substance such as spirits of camphor or weak ammonia. Victims of electric shock may sometimes be resuscitated by the use of artificial respiration employed in conjunction with stimulation. Heat is applied to the extremities and trunk, brandy, strychnine, or digitalis given hypodermically, and inhalations of amyl nitrate administered until the face flushes. In the case of asphyxiation from inhaling either illuminating gas or carbonic dioxide, artificial respiration should be employed together with administration of oxygen through the nostrils. Apparently drowned persons may often be resuscitated by siphoning the water out of the stomach and then using artificial respiration and keeping the body warm by means of artificial heat. See HALL, MARSHALL; PULMOTOR; RESPIRATION, ARTIFICIAL.

RESZKE, rĕsh'ke, EDOUARD DE (1855–). A Polish opera singer, brother of Jean de Reszke, born at Warsaw. After studying with his brother he received instruction from Ciaffei, Steller, Coletti, and Sbriglia. Originally he had studied scientific farming in Silesia and had devoted himself to the care of the family estates. It was at the suggestion of Jean, then in the first flush of his success, that he took up the study of music. He made his first public appearance in 1876 at the Italiens in Paris, and for the next quarter of a century was famous as one of the greatest dramatic bassos of his time. In the nineties he and his brother were prime favorites at the Metropolitan Opera House in New York and at Covent Garden, London.

RESZKE, JEAN DE (1850–). A Polish dramatic tenor, born at Warsaw, a brother of Edouard de Reszke. When but 12 years of age he was singing in the cathedral, where the quality of his voice aroused the interest of the city. Afterward he took up the profession of law and obtained his degree and license. But the attraction of music proved too strong, and he began to study for the stage under Ciaffei and Cotogni. In 1874 he made his début at Venice, as a barytone, under the name of De Reschi. He attained considerable celebrity, but his physical strength began to suffer from the wear and tear of singing parts too low for him, and acting upon the advice of Sbriglia, he retired from the stage and prepared himself in a tenor repertoire. On the completion of two years of study he made his second début, in 1879, at Madrid, this time in the tenor rôle of *Robert le Diable*. His success was instantaneous and his career a continuous artistic triumph, culminating in his unsurpassed interpretation of the great Wagner rôles. He retired from the stage in 1902, and thereafter devoted himself to teaching.

RETAINER (from Lat. *retinere*, to retain, hold back, from *re-*, back again, anew + *tenere*, to hold). The employment of an attorney, counselor, or other legal practitioner, to prosecute or defend an action, or represent a person, in his professional capacity. It is not necessary that a retainer be in writing. Upon being retained an attorney has full powers incidental to professional representation. The term is also applied to a fee paid to a legal practitioner at the time of first consultation, in order to insure his future services, and constituting only a part of his whole fee. See ATTORNEY; COUNSELOR.

A general retainer operates as an employment of the attorney in any matter as to which the client may request his services, for a definite or indefinite period of time, during which the attorney may not accept a retainer from any other person whose interest is adverse to that of the client.

The act of an executor, to whom the estate is in debt, in retaining in his hands a sufficient amount to satisfy his claim, is also technically known as retainer.

RETAINER. See LIVERY.

RETAINING WALLS. Walls built to retain earth or other incoherent substances in positions and forms which without such artificial aid they could not maintain. Most earths, if left to themselves, will not stand with vertical sides, but will fall or slide down until they assume a certain slope. The angle which this slope makes with the horizontal is called the angle of repose, and it varies according to the nature of

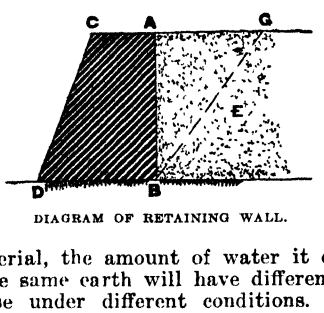

DIAGRAM OF RETAINING WALL.

the material, the amount of water it contains, etc. The same earth will have different angles of repose under different conditions. In the accompanying figure *E* represents a section of a mass of earth which it is desired to retain by the wall *ABDC*. If the line *BG* represent the angle of repose, then it is evident that the duty of the retaining wall is to keep in position the wedge-shaped mass of earth *ABG*. This mass

tends to destroy the retaining wall, (1) by overturning it by rotation along the front edge *D;* (2) by the crushing of the stone along the front edge; and (3) by sliding the wall forward on its base, *DB*, or along some horizontal plane above the base. In designing a retaining wall the engineer seeks to fix its dimensions so that it is safe against destruction by any or all of these destructive tendencies. The difficulty of doing this arises from the fact that the pressures exerted by the wedge-shaped mass of earth vary so greatly with the character and physical condition of the material that they can only be roughly approximated. Water accumulating behind the wall may transform the earth to a semifluid state and thus enormously increase its pressure, therefore one of the chief desiderata in retaining-wall construction is to drain away this water. This is usually accomplished by having drainage holes, commonly called weep holes, through the wall at intervals. Waterproofing of the masonry is also essential.

Retaining walls are generally made trapezoidal in section, as shown by the diagram, but they are also built with rectangular sections and with concave faces. Danger from crushing seldom exists except in very high walls, and danger from shifting can be easily avoided by laying the masonry with its courses dipping slightly from the front towards the rear. As in most modern masonry work, concrete both plain and reënforced now plays an important part in the construction of retaining walls, especially in railway engineering.

RETAL'IA'TION (from Lat. *retaliare*, to retaliate, from *re-*, back again, anew + *talis*, such). Properly, the return of like for like; usually, the infliction upon a wrongdoer of a punishment similar to or the equivalent of the evil which he has wrought. In early law, when wrongs are redressed by the act of the injured party or kinship group, such redress often takes the form of retaliation. The retaliatory idea sometimes assumes peculiar forms, as when the man whose father has been slain seeks to slay in return, not the offender himself, but the offender's father. The clearest expression of the *lex talionis*, or law of retaliation, is found in the Jewish rules, "An eye for an eye and a tooth for a tooth," and "Whoso sheddeth man's blood, by man's hand shall his blood be shed." In the Roman XII Tables *talio* is authorized as a penalty for mayhem (*membrum ruptum*) if the injured party refuses to accept pecuniary compensation. Retaliation is sanctioned in the Visigothic laws, but this (according to Brunner, who asserts that there is practically no retaliatory element in old German law) was due to the influence of the Old Testament.

When public punishment begins to take the place of private vengeance, the penalty may be, and often is, measured according to the degree of wrath which the offense commonly arouses, but purely retaliatory penalties tend to disappear. To punish a perjurer by hewing off the hand which he has raised in swearing, or a slanderer by cutting out the tongue, is not properly retaliation. Such penalties may originate in a sort of personification of the offending member, or they may be based, as Brunner suggests, on the desire to make the relation of crime and punishment obvious: "the penalty itself is to declare why it is imposed." More closely akin to retaliation is the infliction upon a false accuser of the penalty which would have been inflicted on the accused if the charge had been sustained.

In the broad sense of returning evil for evil even when there is no similarity between the offense and the punishment, retaliation includes all extralegal vengeance and all legal punishment. It is in this sense that we speak of the retaliatory theory of punishment, meaning the theory which bases the right of the community to punish criminals on the fact that they have injured the community by their crimes.

As between nations the authorities are divided as to the right of one nation to punish prisoners of war by death in retaliation for similar conduct by the other warring nation.

RETEN'TION (Lat. *retentio*, from *retinere*, to retain, hold back), or CONSERVATION. In psychology, the capacity of the organism to perpetuate the results of learning so that its present activities become significant for similar activities in the future. Retention, therefore, is the presupposition both of habit (q.v.) and of conscious memory. See MEMORY.

In Herbartian psychology (see HERBART) ideas are supposed to maintain their existence even after they have left consciousness. But most recent writers on psychology regard retention as a physical function. It is, they assert, the brain that retains. This view is based partially on the observation of pathological cases, which reveals the fact that both general and specific disturbances of memory are connected with definite changes either in the cortex as a whole or in some limited area of it. (See APHASIA.) These pathological facts have told us something of the seat of retention. Lesions in one region of the cortex affect retention of visual, lesions in another region that of auditory, ideas. There is, however, still much doubt as to the extent of the differentiation of cerebral functions. Concerning the actual physiological changes which are left over from excitation there is also some difference of opinion. Most psychologists agree, however, that the activity which a stimulus produces ceases with the passing of the stimulation or shortly thereafter. A functional modification of the exercised elements, however, appears to remain, so that their subsequent excitation is facilitated. The fact that reproduced ideas often differ widely in structural content from their perceptive originals is a further argument against mental retention. See REPRODUCTION OF IDEAS.

The conditions under which retention takes place are in general the same as those of the establishment of strong impressional and associative tendencies. Among them may be mentioned intense and durative stimulation, attention, suitable mental disposition or determination,

nervous plasticity or freedom from associative inhibition, and the like. Once associative connections have been made, forgetting (the opposite of retention) quickly sets in. It is relatively great in amount during the first few minutes after learning, but after some hours proceeds very gradually. Indeed, it is doubtful if strong associative connections are ever entirely broken, provided only that subsequent disturbances (retroactive inhibitions) can be avoided.

RETENTION OF URINE. A lack of power to evacuate the bladder. This may be either complete or partial. It should be distinguished from suppression, in which there is a failure on the part of the kidneys to secrete urine, and consequently the bladder is empty. The causes of retention may be organic or functional. Among the chief organic causes are: (1) urethral stricture, (2) injuries resulting in contraction or rupture of the urethra, (3) tumors within the urethra or pressing upon it from without, (4) foreign bodies in the urinary canal, such as small calculi, clotted blood, pieces of bougies, catheters, etc., (5) enlargement of the prostate gland, acute or chronic, especially in aged men, abscesses in the perinæum, the pressure of a loaded rectum, the head of the child during labor, or pelvic tumors of any kind. The functional causes of retention are spasm of the urethra or the neck of the bladder, partial or complete paralysis of the bladder, and hysteria.

The symptoms of retention consist of an urgent desire to pass water, with partial or entire inability to accomplish the desire; restlessness; discomfort; and pain accompanying the efforts to evacuate the bladder. If relief is not speedily afforded the bladder may rupture into the peritoneal cavity, in which case death soon follows; or the urethra behind the stricture may give way and the urine be extravasated into the surrounding tissues, provoking severe inflammation and gangrene.

Treatment will depend in its details upon the cause operative in each case. Spasmodic retention can nearly always be relieved by warm baths, heat to the perinæum, purgation, sedatives, or in extreme cases by a few whiffs of chloroform. Attempts should be made to draw off the urine through a small catheter. If this measure fails recourse must be had to aspiration of the bladder through a hollow needle thrust into it through the abdominal wall above the pubes. This measure, however, is rarely necessary. Paralysis of the bladder may arise from the general weakness of old age, from a depressed state of the nervous system in fevers of the typhoid type, in spinal disease, apoplexy, etc. Retention from paralysis is often accompanied by a dribbling away of the urine, so that it may at first be mistaken for incontinence. In chronic prostatic cases the urine has to be regularly drawn off with the catheter. See STRANGURY.

RETHEL, rā'tĕl, ALFRED (1816–59). A German historical painter. He was born near Aix-la-Chapelle and studied under Schadow in the Düsseldorf Academy, and under Philip Veit and Schwind at Frankfort. At Düsseldorf he had earned reputation with episodes from the life of St. Boniface, one of which (1832) is in the National Gallery in Berlin, and in Frankfort he painted "Daniel in the Lions' Den" (1838, Städel Institute); "Guardian Angel of Emperor Maximilian" (fresco, ib.); "Resurrection" (church of St. Nicholas); the portraits of Emperors Maximilian I and II, Charles V, and Philip of Swabia, for the Römer (1838); "Saints Peter and John Healing the Lame" (1840–41, Leipzig Museum); and "Finding of the Body of Gustavus Adolphus" (Stuttgart Museum). In the competition for a cycle of eight frescoes from the life of Charlemagne to adorn the city hall at Aix-la-Chapelle he carried off the first prize and executed (1847–52) five of the subjects: "Otho III in the Tomb of Charlemagne"; "Destruction of the Irminsul"; "Defeat of the Saracens at Cordova"; "Conquest of Pavia in 774"; and "Baptism of Wittekind." The cartoons for these are in the National Gallery, Berlin, and the cycle was afterward completed from Rethel's designs by Josef Kehren. This monumental work, imbued with the spirit of grandeur and simplicity, was the greatest achievement of historical painting in Germany during the first half of the nineteenth century. Attacked by a nervous disease, Rethel in vain sought relief in a visit to Italy and died insane at Düsseldorf. A series of six water colors depicting the "Expedition of Hannibal Crossing the Alps" (1844–45), and his illustrations to the "Dance of Death" (1848, with poetical text by Reinick; 13th ed., 1902), also deserve mention. His brother and pupil OTTO (1822–92), a pupil also of Karl Sohn and Schadow at the Düsseldorf Academy, painted at first scriptural subjects, such as "Boaz Meeting Ruth" (1855, Leipzig Museum), and afterward chiefly portraits and genre scenes. Consult Wolfgang Muller von Königswinter, *Alfred Rethel* (Leipzig, 1861), and Joseph Ponten, *A. Rethel* (Stuttgart, 1911).

RETIARIUS, rē'shī-ā'rī-ŭs. See GLADIATOR.

RETIMO, rā'tĕ-mō A seaport town of the island of Crete, on the north coast, 38 miles west of Candia (Map: Greece, F 8). Pop., 10,000.

RET'INA. See EYE.

RET'INI'TIS (Neo-Lat., from *retina*, so called because like fine network, from Lat. *rete*, net). Inflammations of the retina are primary or secondary to inflammation of other parts of the eye. Both eyes are usually affected. Sight is impaired, the size or form of objects seems altered, the field of vision is contracted; there is a feeling of discomfort in the eyes and at times dread of light. The ophthalmoscope shows a fundus hazy from swelling, tortuous, and dilated veins, a disk with indistinct margins, sometimes hemorrhages. Recovery may be complete or partial.

Several varieties of retinitis are described: simple, resulting from overuse of the eyes; albuminuric, complicating Bright's disease; dia-

betic, observed in cases of diabetes mellitus; syphilitic, occurring in hereditary and acquired syphilis; hemorrhagic, characterized by localized ecchymoses and seen in purpura, nephritis, atheroma of the arteries, pernicious anæmia, etc.; leukæmic, marked by white and yellow spots on the retina; and retinitis pigmentosa, a slow, progressive pigmentary degeneration occurring in the descendants of consanguineous marriages. The treatment of these various forms of retinitis is that of the disease with which they coexist. The retina may become detached as a result of disease, violence, or shock, constituting a serious condition. Consult J. E. Weeks, *Diseases of the Eye* (New York, 1914)

RET'INOS'PORA. A tree. See CYPRESS.

RETIRE'MENT (from *retire*, from OF., Fr. *retirer*, to draw back, from *re-*, back + *tirer*, to draw, from ML. *tirare*, to draw) In the United States army both officers and enlisted men may be retired, i.e., removed from active service and placed on the retired list as pensioners of the government for past faithful services or for disabilities contracted in the line of duty.

Officers *may* be retired on their own application after 30 years' service, *must* be retired on their own application after 40 years' service, and, under a statutory provision, are compulsorily retired at the age of 64 in the army, 62 in the navy. All such officers receive three-fourths of the active pay of the grade at the date of retirement. Officers may also be retired at any age under the provisions of Sec. 1245, Revised Statutes, which reads as follows: "When any officer has become incapable of performing the duties of his office, he shall be either retired from active service, or wholly retired from the service, by the President, as hereinafter provided." The cases of such officers are considered by army retiring boards appointed by the Secretary of War, under the direction of the President, who approves or disapproves the findings of the board. If *retired*, the officer becomes a pensioner of the government; if *wholly retired*, he ceases to be an officer and reverts to the status of a private citizen, receiving, however, one year's pay and allowances when separated from the army.

Under the Act of Congress dated Oct. 1, 1890, providing for examination for promotion, an officer below the grade of major who passes the physical but fails on his second mental examination for promotion to the next higher grade must be honorably discharged, with one year's pay, from the army. If he fails on the physical examination, through disability in line of duty, such officer passes to the retired list.

When an enlisted man of the army shall have served as such for 30 years, either in the army, navy, or marine corps, or in all, he may apply for retirement. His pay is three-fourths of the monthly pay allowed by law for the grade held when retired. In addition he receives $9.50 per month for clothing and rations, and $6.25 per month for quarters, fuel, and light.

With their consent retired army or navy officers may be temporarily assigned to certain kinds of active duty, e.g., as instructors of militia at military colleges, as recruiting officers, on staff duty not involving service with troops, etc., usually accompanied by an increase of pay. Retired officers wear the uniform of their rank, but without regimental or corps insignia. The number of retired officers and enlisted men in the army varies from time to time. In 1915 the number was, commissioned officers 1019, enlisted men 3911. Similar regulations govern the United States navy.

The laws and regulations governing retirement and the status of retired officers and men in the British army and navy are more complicated than those in the United States. In the British army a distinction is made between retired officers and half-pay officers. The latter may be recalled to active service at any time, but a retired officer is ineligible for such service except in case of war. In the United States army the age of compulsory retirement is 64 for all grades. In the British army the age varies with the grade, being 45 for lieutenants and captains, 50 for majors, 55 for lieutenant colonels, 57 for colonels, 62 for major generals, 67 for lieutenant generals. Moreover, officers of all grades may voluntarily retire after a certain specified number of years in a certain grade, receiving upon retirement either a temporary pension or a permanent pension proportional to the number of years' service. Regulations similar to the British exist in almost all armies except the United States.

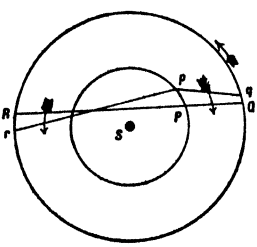
Pensions for the retired officers and men of the British navy and marine are not authorized by statutory law, but are paid out of several different funds, both national and private, under the provisions of an old order in council. Provision is also made for the widows and children of officers.

Davis, *Treatise on the Military Law of the United States* (2d ed., ib., 1909); *Manual for Courts-Martial, Courts of Inquiry, and Retiring Boards*, published by the United States War Department (Washington, 1910); *United States Army Regulations* (ib., annually); *Revised Statutes of the United States* (ib., annually); *Official Army Register* (ib., annually); *Register of the Commissioned and Warrant Officers of the United States Navy and Marine Corps* (ib., annually); *The British Navy List* (London, quarterly); *The King's Regulations* (ib., annually).

RETOR'SION (ML. *retorsio, retortio*, a bending or twisting back, from Lat. *retorquere*, to bend or twist back, from *re-*, back again, anew + *torquere*, to twist). A term of international law signifying an act of retaliation by one nation against another. Unlike reprisal (q.v.), it is not a sufficient justification for war, but is rather a political measure intended to compel one nation to accord equality of treatment to the subjects of the other residing within its jurisdiction. Thus, where one nation imposes restrictions upon aliens residing within its territory, as by unequal taxes or by differential import duties, or fails to observe the rules of international comity, as by refusing to grant the accustomed privileges to ambassadors and other diplomatic agents, the aggrieved nation is justified in applying the same kind of treatment to the offending nation or its subjects. See INTERNATIONAL LAW, *Measures Short of War*.

RETREAT' (OF. *retrete, retraicte*, Fr. *retraite*, from ML. *retracta*, retreat, from Lat. *retrahere*, to draw back, from *re-*, back again, anew + *trahere*, to draw). In military tactics and strategy, a retirement before, or in the face

of, an enemy. It is one of the most difficult as well as critical manœuvres of modern warfare. The rear guard (q.v.) is charged with the important duty of covering the retreat. Arrangements for a retreat are communicated confidentially to only a few senior commanders. In barrack, army post, or camp life and routine in the United States army, the bugle call "retreat" signifies the final assemblage of the men for the day and includes a roll call. In garrison retreat will be not later than sunset. It is played by the field music. (See BUGLE AND TRUMPET CALLS.) Extra duty details, guards, etc., are paraded and go on duty after retreat. The ceremony of the retreat is observed throughout the armies of the world and is usually accompanied by gun fire, the sounding "to the color" by the field music or the playing of the national air when lowering the national color, which is hoisted again at reveille (q.v.).



RETREAT. A term used in the Roman Catholic and Anglican churches to designate a time of temporary retirement from active life for the sake of prayer, meditation, and spiritual exercises. The practice is very ancient in the Church, as a following of the practice of Christ himself. The stricter retreats, especially those which the clergy of most Roman Catholic dioceses make every year, involve the giving up of the whole time to spiritual exercises, and usually silence is observed during them; but in the case of those who cannot leave their employment services in the early morning and evening are provided; in their case the order of observances does not materially differ from that of a mission (q.v.).

RETRENCH'MENT (from *retrench*, from OF. *retrencher*, *retrancher*, Fr. *retrancher*, to cut off, from *re-*, back + *trancher*, to cut, from Lat. *truncare*, to lop, from *truncus*, maimed). A defensive work in military fortification. Its profile resembled that of the redoubt (q.v.) in construction, and it was usually built across the gorge of a redan or bastion, or from shoulder to shoulder, when it was apprehended that the salient angle might fall into the hands of the enemy. Since the increase in recent years in the power of artillery and the growth of armies in many cases to sizes too large for the old-style fortifications, refinements of this type are less important. See FORTIFICATION; REDAN; REDOUBT.

RETRIEV'ER. A dog used in hunting aquatic birds. See FIELD DOG.

RE'TROAC'TIVE (from Lat. *retroactus*, p.p. of *retroagere*, to turn back, from *retro-*, back + *agere*, to do, act, drive), or RETROSPECTIVE, LAWS. These terms are used interchangeably to denote statutes which apply to a state of facts which existed before their enactment. Retroactive laws that are of a criminal or penal nature are specifically known as ex-post-facto laws, and are expressly forbidden by the United States Constitution. The Constitution also prohibits the enactment by the States of laws impairing the obligations of contracts. With these exceptions statutes are not invalid merely on the ground that they are retrospective. Although retroactive laws are in disfavor, there are many which are necessary to remedy defects in the law theretofore existing. See EX POST FACTO; INTERPRETATION; LAW; STATUTE.

RET'ROGRADE (OF. *retrograde*, Fr. *rétrograde*, from Lat. *retrogradi*, to go backward, from *retro-*, back + *gradi*, to walk). A term applied to the motion of the planets among the fixed stars when they appear to move in the *reverse* order of the signs of the zodiac (q.v.). All the planets move in the same direction round the sun, and therefore apparent retrograde motions must be due to their motion *relative* to the earth. In the case of comets, however, we have instances of motion about the sun in the opposite direction to that of the planets, and in such orbits the motion (referred now to the sun, not to the earth) is said to be retrograde. In the case of the planets let S be the sun, and let the two circles represent the orbits of two planets. First, let the planets be, at P and Q, towards the same side of the sun. The planet nearer the sun has of course the greater velocity, and therefore, if p and q represent their positions after the lapse of a given time, Pp is greater than Qq, and therefore the *direction* of the line pq (in which one is seen from the other) has rotated in the *opposite* direction to that in which either planet revolves about the sun. Hence, when a superior planet is in opposition (i.e., if Q be Jupiter and P the earth), it *appears* to move backward among the stars. When an inferior planet is between the earth and sun (i.e., if Q be the earth and P Venus), it *appears* to move backward also. If the planets be on opposite sides of the sun, as at P and R in the figure, let p and r be their positions after a given time; then pr has turned from the direction PR in the direction in which the planets revolve about the sun. Hence any planet, superior or inferior, appears to move *directly* when the sun is between it and the earth. Between these two opposite cases there must of course be points at which the apparent motion is neither retrograde nor direct; then the planet is said to be *stationary*. This case occurs whenever for an instant the lines PQ and pq are parallel, i.e., when the two planets are moving with equal velocities transverse to the line joining them, these velocities being parallel and towards the same side of the joining line.

RETURNING BOARDS. In the United States, official bodies designated by law for canvassing the results of popular elections. The general rule is that a returning board in canvassing the returns sent to it acts in a ministerial capacity and must leave the correction of error or fraud to the courts unless the return be void on its face, in which case of course the returning board must reject it. The board for canvassing the returns of State elections usually consists of certain designated State officers, including the Secretary of State and the Attorney-General. In some States the returns are canvassed by the presiding officers of the Legislature in the presence of the two Houses. In the case of members of the Legislature the returns are usually sent to the Secretary of State, though sometimes to a returning board, but all contests are decided by the Houses themselves in pursuance of a constitutional privilege everywhere allowed. In the case of local officers contested returns are settled by the courts acting as a canvassing authority or in a *quo warranto*

proceeding. In the case of presidential electors Congress provided by the Act of 1887 that disputed returns in any State might be settled by such organs and according to such procedure as State law might provide. If this be not done within six days of the meeting of the electors, the two Houses of Congress have the final determination of the election.

RETZ, rĕts, GILLES DE LAVAL, SEIGNEUR DE. See BLUEBEARD.

RETZ, rĕs, JEAN FRANÇOIS PAUL DE GONDI, CARDINAL DE (1614–79) A French politician and author, born at Montmirail His early education was intrusted to St. Vincent de Paul, and he later attended the Jesuit College at Clermont. It is said that he was compelled by his family to enter the Church in the expectation that he would become Archbishop of Paris, a position which had been held by two members of his house. He was brilliant in his studies, but dissolute in private life. In 1643 he was made coadjutor of the Archbishop of Paris by Louis XIII He devoted himself to his duties with zeal and won popularity by his profuse distribution of alms. At the time of the Fronde (q.v.) he was at first of great assistance to the royal cause, but soon aroused the distrust of the court and became the leader of the popular party, displaying consummate talents for intrigue. In 1651 he became reconciled with the Queen mother, Anne of Austria, and with her aid he succeeded in obtaining a cardinal's hat. After the return of the court to Paris, in 1652, a mission to Rome was offered to Gondi, which he seemed disinclined to accept. Mazarin was determined that his rival should be silenced, however, and managed to have Cardinal de Retz arrested and imprisoned at Vincennes. The Cardinal thereupon resigned the archbishopric of Paris, which had come to him by the death of his uncle, and was allowed to retire to Nantes, whence he made his escape to Spain (1654) and repaired to Rome. There, in spite of his previous renunciation, he again claimed the archbishopric of Paris, and in 1662 he succeeded in bartering it for profitable benefices. At the same time he became reconciled to Louis XIV and returned to France. He sold his estates, paid his heavy debts, and devoted his life to charity and religion. His *Œuvres*, which cover the years 1643–55, are described by Voltaire as displaying the grandeur, impetuosity, and inequality of genius. They are not, however, trustworthy on account of political bias. His *Memoirs* were published in English in 1904. The best edition of his works is that by Feillet in the *Collection des grands écrivains de la France* (Paris, 1870–96). Consult R. Chantelauze, *Le cardinal de Retz et l'affaire du chapeau* (2 vols., Paris, 1878), and id., *Le cardinal de Retz et ses missions diplomatiques à Rome* (ib., 1879)

RETZIUS, rĕt'sĭ-ŭs, ANDERS ADOLF (1796–1860). A Swedish anatomist and anthropologist, father of Magnus Gustaf Retzius. He was born at Lund. He received his education in Copenhagen, Lund, and Stockholm (M.D., 1819), held several governmental offices, and became, in 1824, professor of anatomy at the Caroline Institute in Stockholm. He is well known through his anthropological researches, his works on this subject including *Formen of nordboernes kranier* (1843; translated into several languages), in which he tried to classify the human races according to the formation of the skull, and the collection called *Samlade skrifter of ethnologiskt innehåll* (1864). His *Skrifter* (Collected Works) were edited by his son in 1902.

RETZIUS, MAGNUS GUSTAF (1842–). A Swedish histologist, born in Stockholm, the son of Anders Adolf Retzius. He studied medicine at Stockholm, Upsala, and Lund (M.D., 1871) and was assistant professor at the Caroline Institute from 1877 to 1889 and then professor of anatomy for a year. He made anthropological studies in Europe, America, and Africa. Retzius served as editor of the *Aftonbladet* from 1884 to 1887. In 1911 he received the Prussian Order Pour le Mérite. Besides some 200 papers he published: *Studien in der Anatomie des Nervensystems und des Bindegewebes* (1876), with Axel Key; *Finska kranier (Finnish Skulls*, 1878); *Biologische Untersuchungen* (1880–81; N. S., 1890 et seq., 14 vols. up to 1915); *Gehororgane der Wilbelthiere* (1881–84); *Das Menschenhirn* (1896); *Crania Suecica* (1900, 1902); *Antropologia Succica* (1902), with C. M. Fürst; *Cerebra Simiarum Illustrata* (1906).

REUBENI, rē'ŭ-bā'nē, DAVID. A Messianic pretender of the sixteenth century. See MESSIAH.

REUCHLIN, roiK'lēn, JOHANN, known also by the Greek form of his name, CAPNIO (1455–1522). The first humanist of Germany and one of the earliest promoters of Hebrew studies in that country. He was born at Pforzheim in Baden, Feb. 22, 1455. He began his studies at his native place, continued them at Freiburg, and in 1473 accompanied Prince Frederick of Baden to Paris, where he made the acquaintance of Johann Wessel (q.v.), studied Greek with Gregory Typhernas, and attended the lectures of Lapierre and Gaguin. The next year he went to Basel, where he took his bachelor's degree in 1475 and his master's in 1477. He then revisited France, studied law at Orleans and Poitiers, and gave lectures in Greek and Latin. In 1481 he established himself at Tubingen as teacher of jurisprudence and literature. He entered the service of Eberhard, first Duke of Württemberg, accompanied him to Italy in 1482, and was employed in a number of public services. He visited Italy again in 1490. In 1492 the Emperor made him a count of the German Empire, and about the same time he began the study of Hebrew under Jacob Jechiel Loans, a learned Jew who was Imperial physician. In 1496, after Eberhard's death, he went to Heidelberg and made a third visit to Italy in the service of the Elector Palatine in 1498, whom he defended in a discourse delivered before the Pope and the college of cardinals. At Rome he applied himself with renewed vigor to the study of Hebrew with Obadiah Sporno and Greek with Johannes Argyropulos (q.v.). He returned to Württemberg in 1499 and in 1502 was made a member of the Swabian confederate tribunal, retaining the office till 1513. In consequence of a quarrel between Ulrich, Duke of Württemberg, and the Swabian League, he went to Ingolstadt in 1519 and taught Greek and Hebrew at the university. When the plague broke out at Ingolstadt two years later, he returned to Tübingen, but soon fell sick, and died at Liebenzell, June 30, 1522. Reuchlin is justly regarded as the father of Greek and Hebrew studies in Germany. His devotion to Hebrew was the cause of the most interesting and important incident of his life. In 1509

one Johann Pfefferkorn, a baptized Jew, called upon princes and subjects to prosecute the religion of his fathers and especially urged the Emperor to burn or confiscate all Jewish books except the Bible. The Emperor, through the Elector of Mayence, ordered Reuchlin to give his opinion. In his response of Oct. 6, 1510, Reuchlin maintained that of all Jewish literature only books written directly against Christianity should be destroyed. This attitude drew upon him the enmity of the Dominicans and particularly of the Inquisitor Jakob van Hoogstraten (q.v.). The *Epistolæ Obscurorum Virorum* (q.v.), written by Crotus Rubianus and Ulrich von Hutten, was an outcome of the contest. While there was much in Reuchlin's character and experience to draw him towards the Reformation, he never openly joined the movement and late in life declared against Luther. Melanchthon was his great-nephew. Reuchlin's works include editions and Latin translations of Greek texts: a *Vocabularius Latinus Breviloquus* (1475); a manuscript Greek grammar (not published); the *Rudimenta Linguæ Hebraicæ* (1506), which with pardonable pride he declares to be "the first attempt to execute a grammar of the Hebrew tongue" and made "without any foreign help"; *De Accentibus et Orthographia Hebræorum Libri III* (1518); an edition of the seven Penitential Psalms (1512), the first Hebrew book printed in Germany; *De Verbo Mirifico* (1494); and *De Arte Cabbalistica* (1517), works on the Cabbala; *Scenica Progymnasmata* (1497) and *Sergius* (1507), Latin satirical comedies, not without humor and literary merit; the *Augenspiegel* (1511; ed. by Mayerhoff, Berlin, 1836), a reply to a book by Pfefferkorn (the *Handspiegel*). Two of Reuchlin's Greek treatises, the *De Quatuor Idiomatibus* and *Colloquia Græca*, have been published by Horawitz under the title *Griechische Studien* (Berlin, 1884).

Roth, "Der Kampf um die Judenbücher und Reuchlin vor der theologischen Fakultät zu Mainz, 1509–1513," in *Der Katholik* (Mayence, 1909); also S. A. Hirsch, "Johann Reuchlin, the Father of the Study of Hebrew among Christians," in *A Book of Essays* (New York, 1904).

REUENTHAL, NEIDHART VON. See NEIDHART VON REUENTHAL.

REULEAUX, rē'lō', FRANZ (1829–1905). A German mechanical engineer, born at Eschweiler, near Aix-la-Chapelle, where his father had machine shops. After finishing his apprenticeship in Koblenz, he worked in his father's shops, studied at Karlsruhe, Berlin, and Bonn, and for a year was head of a factory in Cologne. Then he taught in Zurich (1856–64) and in Berlin (1864–96), where after 1868 he was director of the Industrial Academy and the rector of the Technical High School, when the academy was enlarged and the name changed. Until 1884 he was also a member of the Imperial Patent Office. Reuleaux was intimately connected with German machinery exhibits at Philadelphia in 1876 and at Sydney and Melbourne (1879–81). His *Briefe aus Philadelphia* (1877) voice a sharp criticism on German methods of construction and especially on the lack of artistic design. To remedy this fault Reuleaux made a collection of kinematic models in Berlin. His works are: *Konstruktionslehre für den Maschinenbau* (with Moll, 1854–62); *Der Konstrukteur* (1860–62; 4th ed., 1904); *Theoretische Kinematik* (1875); *Kurzgefasste Geschichte der Dampfmaschine* (1891); etc.

REUMONT, rē'mōN', ALFRED VON (1808–87). A German historian. He was born at Aix-la-Chapelle, studied at Bonn and Heidelberg, and in 1832 traveled through Greece and the Ionian Islands. In 1835 he entered the diplomatic service and subsequently was Minister Resident in Italy, principally at the papal court. His historical works include: *Gangancili, seine Briefe und seine Zeit* (1847); *Beitrage zur italienischen Geschichte* (1853–57); *Die Jugend Katharinas de' Medici* (1854); *Die Gräfin von Albany* (1860); *Zeitgenossen* (1862); *Geschichte der Stadt Rom* (1867–70); *Lorenzo de' Medici il Magnifico* (1874); *Geschichte Toscanas* (1876–77); *Vittoria Colonna* (1881); *Charakterbilder aus der neueren Geschichte Italiens* (1886). Upon art he wrote biographies of Michelangelo (1834), Andrea del Sarto (1835), and Benvenuto Cellini (1847), and other works. Consult Hüffer in *Annalen des historischen Vereins fur den Niederrhein*, part 77 (Cologne, 1904).

REUNION, CHAMBERS OF. See LOUIS XIV.

RÉUNION, rā'ụ'nyôN', ILE DE LA, formerly called ILE DE BOURBON. An island in the Indian Ocean belonging to France and situated 420 miles east of Madagascar (Map: Africa, K 7). It is nearly oval in shape with an area of 970 square miles. It is entirely of volcanic origin, the highest peak (a denuded crater) being the Piton des Neiges (10,069 feet). In the Pays Brûlé rises the only active volcano, the Piton de la Fournaise (8713 feet). The plateau composing the island is fissured on all sides by deep cañons through which numerous mountain torrents run to the sea. The villages are limited to the alluvial plains occurring at intervals along the coast. The climate is generally pleasant and healthful, but the island is occasionally visited by devastating hurricanes. The flora and fauna resemble those of Madagascar.

Over one-third of the total area is under cultivation. The principal products are sugar, rum, vanilla, coffee, cacao, and spices. In 1913 imports were valued at 24,935,000 francs; exports, 16,592,000. The imports are principally from France and French colonies; the exports, chief of which is sugar, go almost entirely to France. There are 78 miles of railway, connecting the chief port, Pointe-des-Galets, with Saint-Benoît and Saint-Pierre.

The administration of the colony is in the hands of a Governor, who is assisted by a privy council and an elective council general. The island is represented by one Senator and two Deputies in the French Parliament, and its towns are administered under the municipal code of France. The local budget for 1912 balanced at 5,071,980 francs. In addition a subvention from France of about half the local revenue is required. Pop., 1911, 173,822, of whom 159,218

were European, 8341 Indians, 2927 African, 1868 Malagasy, 884 Chinese, and 584 Arab. The capital is Saint-Denis (pop., 23,972); other important towns are Saint-Pierre (29,481), Saint-Paul (18,646), and Saint-Louis (13,346).

The discovery of the island at the beginning of the sixteenth century is usually assigned to the Portuguese navigator Mascarenhas, after whom it was named originally. It was acquired by France in 1649. From 1810 to 1815 the island was held by Great Britain.

Hermann, *Colonisation de l'Ile Bourbon et fondation du quartier Saint-Pierre* (rev. ed., ib., 1901); H. G. de Cordemoy, *Etude sur l'Ile de la Réunion* (Marseilles, 1905); Lucien Wickers, *L'Immigration réglementée à l'Ile de la Réunion* (Paris, 1911), containing a bibliography.

REUS, rā'ụs. A town of Catalonia, Spain, in the Province of Tarragona, 5 miles northwest of the town of Tarragona (Map: Spain, F 2). The principal buildings are the Gothic church of San Pedro, rebuilt in 1512–69, with a high octagonal tower, and the handsome modern Fortuny Theatre. There are also a large hospital, numerous public and private schools, an academy of fine arts, and a public library. Cotton spinning, which was introduced by English manufacturers in the latter part of the eighteenth century, and silk spinning are the principal industries. The exports are wines, fruit, grain, and confectionery. Pop., 1900, 26,220; 1910, 25,363.

REUS, Count of. See Prim, Juan.

REUSCH, roish, Franz Heinrich (1825–1900). A German Old Catholic theologian, born at Brilon, Westphalia. He studied theology at Bonn, Tübingen, and Munich, and was a friend and pupil of Döllinger (q.v.). Ordained a priest in 1849, he was appointed chaplain at Cologne. In 1854 he became a lecturer on Old Testament exegesis at Bonn, where he was made a full professor in 1861. For his part in the Old Catholic (q.v.) controversy he was excommunicated in 1872. Thereafter till 1878 he was Old Catholic pastor and vicar-general at Bonn. Reusch was editor of the *Bonner theologisches Literaturblatt* in 1866–77. His publications include: *Das Buch Tobias, übersetzt und erklärt* (1857); *Lehrbuch der Einleitung in das alte Testament* (1859; 4th ed., 1870); *Der Index der verbotenen Bücher* (2 vols., 1883–85); *Die Selbstbiographie des Kardinals Bellarmin* (1887); *Geschichte der Moralstreitigkeiten in der römisch-katholischen Kirche seit dem 16. Jahrhundert* (2 vols., 1889), the two last named with Döllinger.

REUSCH, Friedrich (1843–1906). A German sculptor, born at Siegen. He studied in Berlin at the Academy and under Albert Wolff. Among his works in Berlin are the marble group of "Market Traffic" (1879) for the Belle-Alliance Bridge and the "Genius of Steam" for the Technical Academy at Charlottenburg. In Königsberg, where he was appointed professor at the academy in 1881, he modeled the statues of Albert, first Duke of Prussia (1891), and of Emperor William I (1894), both outside the royal palace, besides memorials, busts, and decorative figures and groups for other public buildings. At Siegen are the equestrian statue of William I (1892) and a bronze statue of Bismarck (1900).

REUSS, rois. Two sovereign principalities of Germany, situated between the Prussian Province of Saxony, the Kingdom of Saxony, Bavaria, and some of the Saxon duchies, and separated from each other by the outlying district of Neustadt of the Grand Duchy of Saxe-Weimar (Map: Germany, D 3). They are Reuss Elder Line, or Reuss-Greiz, and Reuss Younger Line, or Reuss-Schleiz-Gera. Reuss-Greiz covers an area of 122 square miles and is largely mountainous. Its principal manufactures are woolens and knit goods. The constitution of 1867 provides for a legislative assembly of 15 members. The capital is Greiz (pop., 1910, 23,245). The principality is represented by one member in the Bundesrat and sends one deputy to the Reichstag. Pop., 1871, 45,094; 1900, 68,396; 1910, 72,769, of whom 96.9 per cent evangelical.

Reuss-Schleiz-Gera consists of a number of detached parcels of territory with a total area of 319 square miles. It is a mountainous country with deposits of marble and salt. The chief manufactures are woolen and cotton goods, machinery, musical instruments, and leather. The constitution rests on the laws of 1852, 1856, and 1913. The legislative body consists of 21 members, the head of the house of Reuss-Köstritz being an hereditary member. The executive and in part the legislative powers are vested in the Prince, who is assisted by a cabinet of three members. The capital is Gera (pop., 1910, 49,276). The principality sends one member to the Bundesrat and one deputy to the Reichstag. Pop., 1871, 89,032; 1900, 139,210; 1910, 152,752, of whom 96.4 per cent evangelical. Consult Richard Mauke, *Heimatskunde des Fürstentums Reuss* (Halle, 1877), and Julius Gaul, *Beiträge zur Landeskunde des Fürstentums Reuss* (ib., 1900).

REUSS, Edouard Guillaume Eugène (1804–91). An Alsatian Protestant biblical scholar. He was born at Strassburg, July 18, 1804, was educated at the seminary of his native town, studied theology and Oriental philology at Göttingen, Halle, and Paris, and took orders in the French Protestant church. He returned to Strassburg as privatdocent in 1828, was made professor extraordinary at the university in 1834, professor in 1836, and held different positions there till 1888. He died April 15, 1891. His principal works are: *Die Geschichte der heiligen Schriften des neuen Testaments* (1842; 6th ed., 1887; Eng. trans., 1884); *Histoire de la théologie chrétienne au siècle apostolique* (1852; 3d ed., 1864; Eng. trans., 1872–74); *Histoire du canon des Saintes Ecritures* (1862; Eng. trans., 1884); *Die Geschichte der heiligen Schriften des alten Testaments* (1881; 2d ed., 1890). He was one of the editors of the great edition of Calvin's works (59 vols., 1869–1900) and published a complete French translation of the Bible with commentaries (19 vols., 1875–81). His work had great importance as leading to the positions of Graf and Wellhausen in biblical criticism. Consult his correspondence (Giessen, 1904); also the memorial address by Lobstein (Strassburg, 1891) and T. Gerold, *Edouard Reuss* (ib., 1892).

REUTER, roi'tẽr, Christian (1665–?1712). A German author, born at Kütten, near Halle. He was a witty and gifted writer, especially effective in character delineation. In his *L'Hon-*

nôte femme; oder die ehrliche Frau zu Plissine (1695) he skillfully uses Molière's fable in *Les précieuses ridicules*. By far his chief work is the novel *Schelmuffskys Reisebeschreibung* (1696), a classic of lies (reëdited by Schullerus in 1885). His other writings include *Der ehrlichen Frau Schlampampe Krankheit und Tod* (1696) and *Letztes Denk- und Ehrenmahl der Frau Schlampampe* (1697), which were republished in 1890. Consult Zarncke, *Christian Reuter, der Verfasser des Schelmuffsky, sein Leben und seine Werke* (Leipzig, 1884).

REUTER, FRITZ (1810–74). A German humorist, who wrote in Low German (Plattdeutsch). He was born at Stavenhagen in Mecklenburg-Schwerin, studied law at Rostock and Jena, and was arrested in Berlin for political agitation (1833), and after four years condemned to death, but his sentence was commuted to 30 years' imprisonment. After four years' confinement in various fortresses he resumed legal studies at Heidelberg, afterward managing his father's country estate till 1850, when he became a private tutor at Treptow in Pomerania. Here he first began to write Low German sketches in prose and verse, the first volumes of which, *Lauschen un Rimels* (1853), showed such charming blending of humor and pathos in anecdotes and genre pictures as to achieve an immediate success. In 1856 Reuter moved to Neubrandenburg and gave himself wholly to writing. The best of his many volumes are *Schurr-Murr* (1861) and *Olle Kamellen* (1860–66). This latter contains the partly autobiographical *Ut mine Festungstid* and *Ut mine Stromtid* (his greatest work) and the vigorous picture of Germany in 1813, *Ut de Franzosentid*, with other work of less value. In 1863 Reuter moved to Eisenach, where he died, July 12, 1874. Reuter is one of the most realistic of the greater German prose writers. It is the realism of the Dutch genre painters, minute, good-humored, bourgeois, as artistic in pathetic as in comic scenes. Reuter's works were issued in a critical edition in seven volumes by Seelmann (Leipzig, 1905). Consult: Hermann Ebert, *Fritz Reuter, sein Leben und seine Werke* (Gustrow, 1874); Otto Glagau, *Fritz Reuter und seine Dichtungen* (2d ed., Berlin, 1875); Gustav Freytag, in *Aufsatze zur Geschichte der Litteratur und Kunst* (Leipzig, 1887); A. Römer, *Fritz Reuter in seinem Leben und Schaffen* (Berlin, 1895); K. T. Gädertz, *Aus Fritz Reuters jungen und alten Tagen* (2d ed., 3 vols., Wismar, 1897–1901); C. H. Thurber, *Fritz Reuter* (Boston, 1914).

REUTER, GABRIELE (1859–). A German novelist. She was born in Alexandria, Egypt, and was educated there and in Germany. Upon the sudden death of her father in 1872 she accompanied her mother to Germany, afterward residing at Neuholdensleben, Weimar, Munich, and Berlin. She began to write in 1876, achieving some success with the rather commonplace novels, *Glück und Geld* (1888); *Episode Hopkins* (1889); *Zu spät* (1889); *Kolonistenvolk* (1891). Upon the advice of Karl Emil Franzos she left the field of the popular conventional novel and struck out along more original lines. Her first notable success, and in the estimation of some her best work, was *Aus guter Familie Leidensgeschichte eines Mädchens* (1895; 16th ed., 1906), a psychological novel of the sufferings of a finer feminine nature under the artificial limitations of modern convention. Following this came the *Novellen: Der Lebenskünstler* (1896); *Frau Bürgelin und ihre Sohne* (1899; 6th ed., 1907); *Frauenseelen* (1901); *Gunhild Kersten* (1904); *Wunderliche Liebe* (1905). Among her later novels may be mentioned *Ellen von der Weiden* (1900; 7th ed., 1912); *Liselotte von Reckling* (1903); *Der Amerikaner* (1907); *Das Tranenhaus* (1909); *Frühlingstaumel* (1912). She is also author of the monographs *Marie von Ebner-Eschenbach* (1904) and *Annette von Droste-Hülshoff* (1904). Although she made a strong and moving plea for the emancipation of women, little that she wrote has sufficient artistic strength to stand the test of time. Consult: R. M. Meyer, *Die deutsche Litteraturgeschichte des 19. Jahrhunderts* (Berlin, 1900); A. F. Krause, in *Nord und Sud* (Breslau, 1902); G. Brandes, in *Gestalten und Gedanken* (Munich, 1903); E. Brausewetter, in *Meisternovellen deutscher Frauen* (2d ed., Leipzig, 1907).

REUTER, HERMANN FERDINAND (1817–89). A German Protestant theologian, born at Hildesheim. He studied in Berlin and Göttingen, in 1843 became lecturer in the University of Berlin, from 1853 to 1876 was successively professor at Breslau, Greifswald, and again at Breslau, and in 1876 was called to Göttingen. His writings in Church history show thorough and scholarly research, and his criticisms are well grounded and clearly expressed. His publications include *Geschichte Alexanders III. und der Kirche seiner Zeit* (1845–64) and *Geschichte der religiosen Aufklarung im Mittelalter* (1875–77). He founded the *Zeitschrift fur Kirchengeschichte*, in which he published his *Augustinische Studien* (1876).

REUTER, PAUL JULIUS, BARON VON (1821–99). A pioneer in the business of news gathering, born at Cassel, Germany. He was connected with the electric-telegraph system from its earliest establishment in Europe, and was the first to organize a central bureau for the systematic collection and dissemination of telegraphic news. This office was opened at Aix-la-Chapelle in 1849. In 1851 he transferred his office to London. Reuter established agencies in all parts of the world to supply him with news and by using all available means of communication and serving all papers impartially, he built up a noteworthy news service. In 1865 he transferred his business to a limited liability company, of which he was manager until 1878. In the same year he obtained from the Hanoverian government a concession for the construction of a cable line between England and Germany. The title of Baron was conferred upon him by the Duke of Saxe-Coburg-Gotha in 1872. See PRESS ASSOCIATIONS AND AGENCIES.

REUTERDAHL, roi'tẽr-dăl, HENRY (1871–). An American painter and writer on naval subjects, born at Malmö, Sweden. Upon coming to New York he began his career as an illustrator of marine subjects in the magazines. He is known especially for his writings with illustrations on naval subjects. In 1908 he published "Needs of the Navy," an article which caused government inquiry of naval conditions. Reuterdahl was attached to the *Minnesota* during the cruise of the United States fleet around South America (1907) and to the *Arkansas* on a Mediterranean cruise (1913). His observations on the 1907 cruise he incorporated in 10 paintings now in possession of the United States Naval Academy. Others are in the National

Museum at Washington. Numerous naval trophies have also been designed by him. During the Spanish-American War he was a correspondent at the front. Reuterdahl received a silver medal at the Panama-Pacific Exposition.

REUTLINGEN, roit'lĭng-*en*. A town in the Kingdom of Württemberg, Germany, on the Echatz, at the foot of the Swabian Alps, 20 miles south of Stuttgart (Map: Germany, C 4). The flamboyant Gothic Marien Kirche, dating from the thirteenth century, was burned in 1726, but was completely restored between 1893 and 1901. Its beautiful tower, 240 feet high, dates from 1494. There are a Gymnasium, a weaving school, a school of women's work, and a pomological institute. The town is an important centre of the yarn, woolen, cotton, and cloth industry, and has numerous tanneries. In 1240 Reutlingen became a free Imperial city. Subsequently it was a member of the Swabian League, and was annexed to Württemberg in 1803. Pop, 1900, 21,481; 1910, 29,807.

RÉVAI, râ'voi, NICHOLAS (1750–1807). An Hungarian poet and philologist, born at Szent Miklós (Torontál). He entered the Piarist Order when he was 17, taught in the schools of the order, and in 1802, after several years devoted entirely to literature, was appointed professor of Hungarian philology in the University of Pest. He had begun to write poetry even before joining the Piarists, and in 1778 and 1787 published volumes of elegiacs and versions from the Latin elegiasts, the Alexandrine poets, the Anacreontics, and a part of the *Iliad*. But his chief title to remembrance lies in his work in Magyar historical grammar, as contained in *Antiquitates Literaturæ Hungaricæ* (1803) and *Elaboratior Grammatica Hungarica* (1803–06).

REVAL, rĕv'ăl (Russ. *Revel*). An important Baltic seaport of Russia and capital of the Government of Esthonia, situated on the Bay of Reval, an inlet of the Gulf of Finland, about 230 miles west-southwest of St. Petersburg (Map: Russia, B 3). The town consists of two parts, the upper town, or Domberg (Cathedral Hill), with the old castle, the administration buildings, and the residences of the aristocracy, and the lower town, mediæval in appearance and containing the old town hall, the house of the Schwarzhäupter (an association of merchants), dating from the time when the town was a member of the Hansa, and a guild house with a museum of Baltic antiquities. The educational institutions include three Gymnasia, a Realschule, and a technical railway school.

The manufactures are machinery and beer. The harbor of Reval is one of the most spacious in Russia and freezes but seldom. Reval ranks third among the Baltic ports of Russia. Its exports and imports in 1912, about 533,000 tons, were valued at over $52,000,000. The principal exports are spirits, grain, flax, animals, and a species of anchovy which is caught and pickled locally; the chief imports, cotton, coal, and petroleum. Reval is the seat of an admiralty and of the administration of the Baltic lighthouses. The sea baths in the vicinity are well patronized. Pop., 1910, 98,995, about one-half Esthonian and over one-fourth German. The foundation of Reval is ascribed to the Danish King Waldemar II. The town joined the Hanseatic League in 1284 and soon attained considerable commercial importance. In 1346 it passed from the overlordship of the Danes to that of the Teutonic Knights. Sweden acquired it in 1561, and Peter the Great annexed it to Russia in 1710. The construction of a naval harbor was begun in 1912. The town was bombarded by the Germans in the European War which broke out in 1914. See WAR IN EUROPE.

RÊVE, râv, LE (Fr., The Dream). One of the Rougon-Macquart series of novels by Emile Zola (1888).

REVEILLE, re-vāl'yâ, *or* (more usually in United States military service) rĕv'â-lē' (OF. *reveil*, Fr. *réveil*, awakening, from OF. *resveiller*, to wake again, from *re-*, again + *esveiller*, to awake, from Lat. *ex*, out + *vigilare*, to awake, from *vigil*, wakeful, from *vigere*, to be lively; ultimately connected with Eng. *wake*). A military trumpet, bugle, or drum call sounded at break of day, or such time afterward as may be ordered, to rouse the men from sleep. Officially it is the commencement of the day's routine. The military day is from reveille to retreat (q.v.), and the night from retreat to reveille. See BUGLE AND TRUMPET CALLS.

REV'ELA'TION (Lat. *revelatio*, from *revelare*, to reveal, unveil, from *re-*, back again, anew + *velare*, to veil, from *velum*, veil, cloth, sail, from *vehere*, to carry along). In theology, a term used in both a general and a specific sense. In its broadest signification it expresses the unveiling or manifestation of the divine to the human. In the narrower sense it is applied to one form of this manifestation, viz., the written word of God in the Bible.

Using the term in the first or general sense, God manifests Himself in nature, in history, in the moral government of the world, in reason, and in the old ethnic religions and certain of the pagan philosophers. It seems impossible to believe in man and in a personal God without believing in a revelation. The aspirations of the soul demand it. Man himself, as reflecting the divine image, warrants it. Nature gains a meaning only if it is the speaking and acting of God—divine language in cipher. The universe is a manifestation of God's glory, a disclosure of His power. Specific revelation does not contradict these indications of divine truth in nature. It gives them articulate expression. History and revelation are inseparable. The march of events and the development of ideas are but parts of a moving panorama of divine creation and guidance. As men have studied the history of the human race they have found truths about God and His purpose in the world. Reason and revelation are not antagonistic. Reason grasps and discerns and even defines the supersensuous. It is part of the divine image in man, and so is naturally predisposed to the reception of the revealed. The ethnic religions were clearly media of divine revelation. They were partial disclosures of God to man—a feature in His gradual unveiling of Himself. They were preparatory to Christianity. Pagan philosophy, in the persons of some of its brightest lights, was a part of revelation. Men like Socrates, Plato, and Aristotle among the Greeks, and Cicero, Epictetus, and Marcus Aurelius among the Romans, had wonderful glimpses of truth and formulated admirable moral codes. They have been described as Christians without knowledge of the Christ. In fact natural and revealed religion are now widely viewed as parts of a great whole and not as distinct and separate manifestations of the divine. Much of the teaching of revelation, technically so called,

consists in the unveiling to us of nature and of life. Revelation does not merely superadd to the achievements of human knowledge. It penetrates to the moral and spiritual meaning of the world in which we live.

Historical theology has maintained that, despite all this, the fact remains that the disclosure of the divine in revelation generally was but partial and therefore preparatory to a specific revelation. Man in his intellectuality was painfully sensible of the soul sickness of the world, but he had no cure. To break the power of sin and quicken the higher and spiritual life he needed a revelation of fatherly love. The deepest discoveries and loftiest achievements of the human intellect needed to be supplemented by a special revelation. "The world by wisdom knew not God." The specific revelation was given in the written word. It may be divided into three epochs, the primitive revelation or protevangelium, the covenant revelation to Israel, and the revelation in the appearance of Jesus Christ. The Incarnation (q.v.) is held to be the culmination of every divine manifestation, the central point of all history sacred and profane (Heb. i. 1, 2). The Old Testament represented a gradual process of education. God gave to men as they were able to receive. But the message became more and more explicit as the history of the ancient people was developed, until it culminated in Jesus Christ, in whom men saw "God manifest in the flesh" (John i. 18). The crown of the Old Testament religion was prophecy, and Jesus was the greatest of prophets.

In discussing the specific revelation of the Scriptures it should be borne in mind that revelation and inspiration are not synonymous terms. Revelation has been limited to the direct communication from God to man of (1) such knowledge as man could not attain in and of himself and (2) information which, though attainable in the ordinary way, was not, in point of fact, known to the person who received the revelation. Inspiration is explained as the actuating energy of the Divine Spirit, under whose guidance the human agents chosen by God have officially proclaimed His will either by (1) word of mouth or (2) the committal to writing of the several parts of the Bible.

Guth, *Revelation and its Record* (Boston, 1912); and the works mentioned under INSPIRATION.

REVELATION OF SAINT JOHN, THE. The name given in the English Bible to the last book in the New Testament, the word "revelation" being the Latin equivalent of the Greek word ἀποκάλυψις, *apocalypsis* (uncovering or unveiling), the first word of the book.

I. **General Character of the Book.** The Book of Revelation belongs to a distinct class of literature, which has been called, probably after the title of this book, apocalyptic. (See APOCALYPTIC LITERATURE.) Only in the light of this classification can the book be understood. An apocalypse usually seeks to explain the present dominion of evil in the world and to encourage faith in God and His rule by foretelling the approaching end of evil and the fulfillment of the prophetic hopes. The origin and reign of evil are usually assigned to the agency of fallen angels and of evil spirits generally, and the consummation hoped for is a new world age which will come by a miraculous deed of God. Man must wait for this with patient faith, and the seer's art consists chiefly in discovering the time and manner of its coming. This he does by such a fitting together of ancient prophecies and apocalyptical images with the events of his own time as shall give assurance that the longed-for end is at hand.

Turning to the Book of Revelation, there can be no doubt that it is an apocalypse in the sense just defined, and the presumption that it is to be interpreted as such is strong. Like Daniel, it was written in a time of religious persecution at the hands of the ruling kingdom of the world, and its aim was to encourage the faithful to resist the allurements and endure the violence of the world power in view of the speedy coming of judgment and deliverance. Like Daniel, also, it has the course and end of world history in view and not principally the destiny of the individual soul. Other apocalyptical features of the Book of Revelation are its constant use of the vision form with angelic interpreters; its abundance of highly wrought and fantastic imagery, derived in large part from the Old Testament and from apocalyptical traditions, though freely combined and applied to new conditions; its explanation of the present dominance of evil as due to demonic powers, whose malign rule is embodied in Imperial Rome; and its general scheme of the future, which embodies many elements drawn from Jewish apocalypses. The Christian character of the book does not involve differences great enough to justify us in separating the book from its class and applying to it different methods of interpretation. It is, then, to be assumed that the predictions of the book concern the immediate and not the distant future, as indeed the writer explicitly affirms (i. 1, 3, xxii. 10–12). We may expect to find visions or fragments from earlier writings or traditions and to be able to distinguish between their earlier setting and application and the meaning our author gives them. Furthermore, we may expect to find the value of the book to lie, not in disclosures of the course of Church history down to the present, nor in predictions of still future events, but, historically, in its fitness to meet a great crisis in the life of the early Church, and permanently in its underlying faith in God and the certain victory of His cause.

II. **Contents and Plan.** The contents of the book may be outlined as follows:

Brief introductory statement showing the source and authority of the book (i. 1–3).

A. The letters to the seven churches (i. 4–iii. 22).

1. General introduction (i. 4–20), containing (1) the signature (John) and address (i. 4a); (2) salutation from God and the heavenly spirits and Jesus (i. 4b–5a); (3) ascription of praise to Jesus (i. 5b–6); (4) announcement of his coming to judgment (i. 7–8).

2. John's vision of Jesus, who commands him to write (i. 9–20).

3. The messages to the seven churches of Asia (ii. 1–iii. 22).

B. The Apocalypse proper (iv–xxii).

1. Introductory. (1) The heavenly King on His throne (iv); (2) the seven-sealed book and the Lamb who alone can unseal it (v. 1–7); (3) the Lamb receives the book. Hymn of praise (v. 8–14).

2. The seven seals, trumpets, and plagues (vi–xviii).

(1) The seven seals broken. After the first six a pause, then the seventh introduces the next series of events (vi. 1–viii. 5).

(2) The seven trumpets and their accompanying calamities (viii. 6–xiv. 20). Again after the first six a pause (x. 1–xi. 14), then with the seventh trumpet the kingdom of Christ is announced and its great conflict with Satan is unfolded (xi 15–xiv. 20).

(3) The seven last plagues, culminating in the great judgment on Babylon (Rome) (xv–xviii).

3. The culmination, the conquest and final punishment of the beast and his followers and the marriage of the Lamb (xix–xxii).

III. **Interpretation.** The curious history of the interpretation of this book cannot here be reviewed. It has been supposed to have been written against Mohammed and the Turks; against the Pope and the Roman Catholic church; against Luther and the Reformation; against Napoleon; etc. Many still hold that the book predicts the whole course of Church history past and to come. Almost all modern scholars, however, seek for the meaning of the book in the conditions of the writer's own time.

Imperial Rome, the persecutor of the Church and claimant of divine honors in the person of the Emperor, is the beast, the agent of Satan, which the book assails and whose fall it announces. Isolated scholars of far older times knew this, but it was especially the work of Lücke, Bleek, and Ewald that established it. With this is commonly connected the view that Nero was the wounded head (xiii. 3), the name signified by 666 (xiii. 18) and the one whose return from Hades and attack upon Rome in alliance with the Parthians is predicted in chapter xvii.

In different parts of the book different periods and different types of religious thought appear to be indicated. These facts and the composite character of some Jewish apocalypses have led to the effort to solve the problem of the book's composition by literary analysis and the theory of various dates and authors. Weizsäcker suggested in 1882 that the writer incorporated some older oracles, Jewish or Christian, such as vii. 1–8, vii. 9–17, xi. 1–13, xii, xiii, xvii. Vischer, on the other hand, proposed the view that the book is a Jewish apocalypse (iv. 1–xxii. 5, omitting obvious Christian amendments) set in a framework (i–iii, xxii. 6–21) and slightly revised by a Christian hand. This theory came out in 1886 with Harnack's indorsement and was accepted by several German critics. More elaborate analyses followed. Two Jewish apocalypses were found in the book by Weyland, and Spitta (1889) made the original book a Christian apocalypse by John Mark (60 A.D.), to which a later Christian added two Jewish apocalypses of the times of Caligula and Pompey. Against such views there has been a reaction in favor of the simpler one of Weizsäcker. The unity of the book is maintained, but the writer is believed to have made use of materials already shaped by earlier hands and in part Jewish in origin. The Jewish character of vii. 1–8 and of xi. 1–13, with its date before 70 A.D.—Jewish oracles applied in a figurative sense to Christians as the true Israel—and some of the peculiarities of xii, xiii, xvii, and other passages, may thus be explained in a way consistent with the ascription of the book to a Christian writer of Domitian's reign.

The next problem naturally is concerned with the first meaning of these incorporated materials. The most important study in this direction is that of Gunkel in reference to chapter xii (1895). His theory is that the dragon who seeks to kill the child and persecutes the mother is ultimately derived from a Babylonian account of the birth of Marduk, the sun god, destined to destroy the chaos dragon and to create the world. Many who have not accepted Gunkel's reconstruction of an otherwise unknown part of the Babylonian myth have approved in general his emphasis on tradition as a great factor in the production of an apocalypse, and many have assented in particular to his theory that a sun myth underlies chapter xii, whether Babylonian or Greek (Dieterich) or Egyptian (Bousset, with hesitation) in origin. Wellhausen has objected to the method and declared that the writer's own meaning is all we need to inquire after, and that he has shaped his figures to represent current events to a much greater degree than Gunkel allows. Bousset, one of the most important recent writers on the subject, adheres in general to Weizsäcker's idea of the composition of the book and to Gunkel's view of the significance of tradition. He put forth the hypothesis that an apocalypse of Antichrist, of Jewish origin, was current in New Testament times and on into the Middle Ages; that it was not dependent on Revelation, but that several of the fragmentary (Jewish) traditions which Revelation incorporates were derived from it (vii. 1–8, xi. 1–13, xiii. 11–17, xiv. 14–20).

Along with the recognition of the writer's dependence on or use of apocalyptical tradition, rightly emphasized by Gunkel and Bousset, it is also necessary to recognize the fact that he used Old Testament material with much freedom and often in the spirit of a poet. This is illustrated by such passages as i. 12–20, iv, xviii, xxi–xxii. 5. The author wrote as one whose mind was filled with Old Testament prophetic language; but though often quite limited to it for the expression of his thoughts, yet he used it freely and put into it the emotions of his own soul. That these were intense is a fact that must be seriously reckoned with in studying his book, whatever one may think about the question of actual ecstasy.

IV. **Historical Occasion, Purpose, and Date.** The seven letters (chapters i–iii) are the most original part of the book and contain the most specific references to concrete conditions. Though addressed to actual churches whose conditions the writer knows, they are evidently

meant, taken together, to give the message of the spirit of Christ to all his churches. The seven cities are named in geographical order, moving from Ephesus north, east, and south. The worship of the Emperor had been enforced in this region for a long time. Pergamum had a temple to Augustus in 29 B.C. and remained the centre of the cult in Asia (cf. Rev. ii. 13). The Book of Revelation was written chiefly to expose the real character of this worship of a mere man and to encourage Christians to refuse to conform to it at whatever cost. This cult as it was practiced in the Province of Asia and encouraged by the provincial officials is the second beast of chapter xiii, and all who take part in it are threatened with the impending fate of Rome itself, while those who resist it even to death will receive a glorious reward. Some persecutions of Christians had already been endured (ii. 3, 13, iii. 8), but far more severe trials were at hand (ii. 10, iii. 10), for which the book would prepare the way. The glory and reward of martyrdom are vividly portrayed. An official persecution of Christianity such as is here contemplated points to a time not earlier than Domitian. The relaxation of earlier zeal, the loss of love, the adoption of heathen ways of living, which the letters condemn, indicate the same period, as does the fact that Paul's position as founder of the church at Ephesus appears to be wholly a thing of the past. It is true that xi. 1–13 dates from before 70 A.D., but it is no less certain that it was originally a Jewish oracle. Its application in a figurative sense to the safety of the true worshipers of God, i.e., Christians, in the approaching crisis shows that the literal siege and fall of Jerusalem had long ago proved the oracle to be in its literal sense—which was indeed contrary to the word of Jesus—untrue. In xvii. 10 Vespasian seems indicated, but verse 11 is probably meant to carry us over into Domitian's reign. If the Nero myth is referred to in chapter xvii, this also, in this form, belongs to the close of the century. We may therefore conclude that the book was written, as Irenæus says, "near the end of the reign of Domitian," i.e., about 93–96 A.D.

V. **The Christianity of the Book.** The relation of the book to Paulinism is an unsolved problem. The stress it lays upon the transcendence of God and upon the kingly and judicial functions of Christ, its view of salvation as a reward for overcoming the world and keeping the commands of God, are Judaistic aspects of the religion of the book. Its attitude towards Rome, also, is not that of Christ (Mark xii. 17) and of Paul (Rom. xiii. 1–7, cf. 1 Pet. ii. 13–17). Yet an anti-Pauline tendency need not be inferred. Circumstances had changed, and Rome had become the enemy of the Church and the power of lawlessness instead of the one who restrained that power (2 Thess. ii. 7) and protected rather than persecuted the Christian, so that Antichrist now inevitably took on a Roman in place of a Jewish form. Furthermore, over against the Jewish-Christian traits of the book we find a Christology not unrelated to Paul's (cf. i. 5, iii. 14, with Col. i. 18, and Rev. v. 9 et seq. with Phil. ii. 5 et seq.), an eschatology at many points in striking agreement with his, and a universality which at least is totally different from the exclusiveness of Paul's Judaistic opponents (vii. 9 et seq.). We cannot therefore with Baur regard Revelation as a simple product of the Jewish Christianity which opposed Paul. It is probably best to say that the book represents a late development of primitive Christianity, not much influenced either way by Paul.

VI. **Canonicity and Authorship.** The place of Revelation in the canon has been much disputed. It was accepted in the Western Church after Hippolytus wrote in its defense against Caius, a presbyter of Rome (c.215). For a long time the Eastern Church refused to recognize the book as canonical. Eusebius records and sympathizes with the objections of its critics. It was not in the original Syriac New Testament. The pressure of the Western Church finally secured its place in the canon. In the West only Jerome shows some sympathy with Eastern doubts. Its place in the canon was again somewhat insecure at the beginning of the Reformation; Luther in the first edition of his New Testament expressed a strong aversion to it because of its obscurity and especially because he did not find in it the Pauline gospel. Later he expressed a more favorable judgment. Zwingli did not accept it as canonical. Calvin at least did not comment upon it.

The writer calls himself John (i. 1, 4, 9, xxii. 8) and says that he saw his visions on the island of Patmos (q.v.), where he was, it would seem, in banishment. Justin Martyr is the first to identify this John with the Apostle, and from Irenæus and Tertullian onward this view was almost unquestioned. Yet Dionysius of Alexandria (c.255) argued on the basis of a comparison with the Fourth Gospel that the author of Revelation was another John; and Eusebius suggested the presbyter John, of whom Papias speaks. The earliest opponents of the canonicity of the book, the Alogi, ascribed it to the Gnostic Cerinthus, an idea adopted by Caius. The author himself does not say that he is an Apostle (see on the contrary, xxi. 14, xviii. 20), and nowhere reveals any personal knowledge of the earthly life of Jesus. It cannot quite be said that he assumes a position of personal or official authority over the seven churches. He is their brother and fellow in trial (i. 9), but the authority that speaks through him is Christ. He claims only to be a true prophet, truly to convey the message of Christ. For his book he makes great claims, but not for himself. Of the three possibilities—that it is by the Apostle; that it is a pseudonymous writing in the Apostle's name; and that it is by another John—the second can with some confidence be rejected. For though pseudonymity characterizes all Jewish apocalypses, we find here none of the familar signs of it, no references to known events in the life of John such as we should expect. If the Apostle was the recognized head of the churches of Asia centring in Ephesus during the last quarter of the first century, the expression "John to the seven churches" (i. 4) would suggest him. If that place was occupied by John the presbyter, he would be the one indicated. The most serious difficulty in the way of accepting the Apostle's authorship is the radical difference in style and in conception that separates the Apocalypse from the Gospel. Though minor points of likeness exist, the difference is so great that it seems almost impossible to ascribe them to one mind. The difficulty is greater now that it is no longer probable that they can be sepa-

rated widely in date by putting Revelation before 70 A.D. The question of authorship must therefore remain open, but this question does not affect our view of the value of the book and the way in which it is to be understood.

Bibliography. A full bibliography is given in James Moffatt, *Introduction to the Literature of the New Testament* (New York, 1911), also in Wilhelm Bousset, *Kommentar* (Göttingen, 1906). The best recent commentaries are those of Bousset (Göttingen, 1906) and Holtzmann (Freiburg, 3d ed., 1908), and in English, Simcox, *Cambridge Bible* (Cambridge, 1898); Scott, *Century Bible* (Edinburgh, 1902); Swete (New York, 1909); Moffatt, *Expositor's Greek Testament* (ib., 1910). Consult also the introductions to the New Testament by Weiss (London, 1887); Holtzmann (Freiburg, 3d ed., 1892); Julicher (Tübingen, 3d ed., 1901); Zahn (Edinburgh, 1909); Moffatt (New York, 1911). In addition to standard works on New Testament theology and histories of the apostolic age: Gunkel, *Schopfung und Chaos in Urzeit und Endzeit* (Göttingen, 1895); Bousset, *The Antichrist Legend* (trans. by Keane, London, 1896); articles by Bousset, "Apocalypse," in *Encyclopædia Biblica* (ib., 1899), and Porter, "Revelation," in Hastings, *Dictionary of the Bible* (New York, 1898); *The Messages of the Apocalyptic Writers* (ib., 1905); W. M. Ramsay, *The Letters to the Seven Churches* (ib., 1905); R. H Charles, *Studies in the Apocalypse* (Edinburgh, 1913).

REVELL, rē-vĕl′, FLEMING HEWITT (1849–). An American publisher. He was born and educated in Chicago and in 1869 entered upon independent editorial and publishing work. After 1890 he was president of the Fleming H. Revell Company, publishers, who made a specialty of religious books. Revell became also a trustee of the New York Life Insurance Company and was active in the work of the Presbyterian church and of the New York Y. M. C. A.

REVELS, MASTER OF THE. See MASTER OF THE REVELS

REVELSTOKE, rēv′el-stōk. A city in the Kootenay district, British Columbia, Canada, on the Columbia River and on the Canadian Pacific Railway, 379 miles northeast by rail from Vancouver (Map: British Columbia, E 4). It is a divisional point on the Canadian Pacific and the seat of the county court for West Kootenay. The industrial establishments include railway repair shops, saw mills, breweries, and manufactories of sashes and doors, and cigars. Pop., 1911, 3017.

REVENTLOW, rā′vĕnt-lō, CHRISTIAN DITLEV FREDERIK (1748–1827). A Danish statesman and reformer, educated at Sorö and Leipzig. He traveled on the Continent and in England to study economic conditions. Reventlow completely changed the status of the Danish peasantry by placing them on an equal footing with other subjects. His agricultural and educational reforms he first introduced on his estates, then throughout the nation. The ultraconservative Guldberg ministry opposed him, but with its fall (1784) and the coming of Bernstorff Reventlow had his chance. Through great administrative ability he rose to be Minister of State (1797). A commission appointed by him to investigate the condition of the peasantry resulted in the reform mentioned. Reventlow also accomplished reforms in banking, taxes, and trade, including abolition of the monopoly of the Iceland trade. In 1813 he resigned from all offices except that of Minister and retired.

REVENTLOW, ERNST, COUNT (1869–). A German journalist and Pan-Germanist, born at Husum. He was early in the navy, where he rose to be captain. During the European War (1914 et seq.) he wrote many truculent articles for the *Deutsche Tageszeitung*, on which he was a leading editorial writer, enthusiastically supporting the Von Tirpitz plan of submarine warfare. When the German government signified its willingness to comply with demands of the United States that the rights of American citizens on the high seas be respected, the *Tageszeitung* was suspended (1915) because it opposed such compliance. Reventlow's writings include: *Russisch-Japanische Krieg* (3 vols., 1904–06); *Deutschland in der Welt voran* (3d ed., 1906); *Die deutsche Flotte und ihre Aufgaben* (1906); *Holder Friede, susse Eintracht* (1906); *Die englische Seemacht* (1906); *Kaiser Wilhelm II und der Byzantiner* (1906); *Weltfrieden oder Weltkrieg* (2d ed., 1907); *Gefahr in Verzug* (1907); *Der Kaiser und die Monarchisten* (1913); *Deutschland zur See* (1914); *Deutschlands auswartige Politik, 1888–1913* (1914); *Der Vampir des Festlandes* (1915).

REVENUE, PUBLIC. See FINANCE; INTERNAL-REVENUE SYSTEM; TAXATION.

REVENUE-CUTTER SERVICE, UNITED STATES. A military service, organized by Act of Congress in 1790, for the enforcement of navigation and customs laws. It was the first armed maritime force of the government, having been constituted about eight years before the United States navy. There being no naval establishment at that time, the service, as a matter of convenience, was attached to the Treasury Department, then presided over by Alexander Hamilton, where it has since remained. Its first fleet consisted of 10 small, single-masted, light-draft sailing vessels, manned with 10 masters, 30 mates, 40 mariners, and 20 boys. By degrees, and as occasion arose, the service was augmented in strength and armament, and on July 1, 1799, Congress authorized the President to "cause the revenue cutters to be employed to defend the seacoast and to repel hostility to vessels and commerce within their jurisdiction." The rapid growth of foreign trade and a shipping interest that was constantly developing at home created the necessity for more efficient means of protection, and swifter cruisers, better armed, manned and equipped, were gradually added to the force. The duties of these vessels were extended to the suppression of piracy, that had become common on account of the many adventurers attracted to American waters. A distinctive revenue ensign and pennant were provided by law. (See Colored Plate in article UNITED STATES.) Beginning in 1843, steamers were introduced, and they have entirely superseded the old type of sailing cutters.

Revenue cutters have participated in all the wars of the United States except the Algerine war and have been prompt to respond to any emergency. In 1797, when France assumed a belligerent attitude, and during the troublous times that followed, the cutters aided in maintaining the dignity and position of the government. Seven of them were employed in the waters of the West Indies. The Embargo Act of 1807, intended to countervail Napoleon's decrees, put the service into special requisition in

guarding the seaboard and preventing the departure of unauthorized merchant ships. In the War of 1812 its force was actively engaged in patrolling the coast and repelling foreign invasion. During the nullification troubles of 1832–33 several revenue vessels were stationed off Charleston ready to enforce the execution of the tariff laws. At the time of the Seminole War, in 1836, they transported troops and munitions and afforded protection to settlers along the coast. In the war with Mexico eight vessels shared in the naval attacks on Alvarado and Tabasco and coöperated with the naval squadron. In 1858 the steam cutter *Harriet Lane* took part in the naval expedition to Paraguay and was considered one of the most efficient ships of the fleet. During the Civil War the cutters were busily engaged conveying dispatches, pursuing blockade runners, doing guard and reconnoissance duty, and joining in attacks on the enemy's forts and batteries. Throughout the war with Spain 20 vessels of the service, carrying 71 guns, 131 officers, and 725 men, were employed with the army and navy, while 3, just constructed, with 25 officers and 210 men, were under orders to go to the front when the war closed. Eight cutters were in the North Atlantic squadron on the Cuban blockade, 4 coöperated with the navy on the Pacific coast, while one was in the battle of Manila Bay.

The affairs of the Revenue Cutter Service are administered by the captain commandant, under the direction of the Secretary of the Treasury. In the field the service is divided into five divisions, each under the supervision of a senior captain. The headquarters of these divisions are located at Boston, Mass., New York City, San Francisco, Cal., Seattle, Wash., and Unalaska, Alaska.

In 1915 there were in the service 44 vessels, 19 of them harbor and anchorage boats, steam launches, etc., and the remaining 25 steamers ranging from 400 to 1700 tons' burden. Those built of steel in recent years are admirable models of marine design and architecture and are among the fastest of their class afloat. Nearly all have been constructed under the immediate supervision of officers of the corps and devised with special reference to the general needs of the service. They are usually armed with from two to nine improved rapid-fire guns and are provided with necessary small arms for the use of the crews. In time of war their equipment may be readily augmented. The vessels are kept prepared, as far as possible, for prolonged voyages and the performance of any duty that may be legally assigned them. In this connection it may be stated that about all the early authentic information concerning the natural features of Alaska, its climate, the characteristics of the natives, and the resources of that country, were obtained by explorations made by officers of the revenue-cutter service. Several vessels make cruises each year into the Bering Sea and Arctic Ocean for the protection of the fisheries and government interests.

The active list of the service comprised, in 1915, a captain commandant, 6 senior captains, 31 captains, 37 first lieutenants, 42 second lieutenants, 42 third lieutenants, 1 engineer in chief, 6 captains of engineers, 28 first lieutenants of engineers, 22 second lieutenants of engineers, 24 third lieutenants of engineers, 2 constructors with rank of first lieutenant, and 21 cadets and cadet engineers. In addition there are about 1648 warrant officers, petty officers, and seamen. The officers of the engineer corps rank with line officers of corresponding grades. All are commissioned by the President, by and with the advice and consent of the Senate, and, under the law, rank is held as follows: captain commandant with colonels in the army and captains in the navy; senior captains with lieutenant colonels in the army and commanders in the navy; captains with majors in the army and lieutenant commanders in the navy; first lieutenants with captains in the army and lieutenants in the navy; second lieutenants with first lieutenants in the army and lieutenants (junior grade) in the navy; third lieutenants with second lieutenants in the army and ensigns in the navy. When revenue cutters serve in coöperation with the navy, pursuant to law, their officers below the rank of senior captain hold rank with and next after naval officers of the grades named. The captain commandant and officers of the rank of senior captain hold rank with naval officers of the grades named. The commissioned officers of the service receive the same pay and allowances as officers of corresponding rank in the army and are retired for physical disability or on reaching the age of 64 years. Promotions are made, in the order of seniority, to fill vacancies which may occur in the various grades, after the candidates have qualified by a professional examination.

In 1876 Congress enacted a measure permitting the Secretary of the Treasury to appoint cadets to fill vacancies occurring in the grade of third lieutenant. The object was to provide means for educating young men for deck officers. Under the operation of this system the active list of the line in 1915 was composed of cadet graduates with but one exception. Some 10 additional appointments have been made from graduates of the Naval Academy. Before the cadet system was organized candidates from the merchant marine and volunteer navy were admitted directly to the grade of third lieutenant. An applicant for a cadetship in the line must be not less than 18 nor more than 24 years of age, of vigorous constitution, physically sound and well formed, not less than 5 feet 4 inches in height, of good moral character, and unmarried. He is required to pass a satisfactory entrance examination in spelling, geography, general history and Constitution of the United States, grammar, composition and rhetoric, arithmetic, algebra, geometry, trigonometry, physics, English literature, one modern language (either French, German, or Spanish), and general information. The examination, which is open to all qualified persons, is held annually under the direction of the Secretary of the Treasury. From those passing highest, provided they reach the required standard, a class is formed which is ordered to report for instruction at the Revenue Cutter Academy located at New London, Conn. The term at the academy covers a period of three years and comprehends a strict course of discipline and instruction in all matters pertaining to the professional requirements of an officer. A cadet receives $500 per annum and one ration per day and must provide himself with the prescribed uniforms. At the expiration of his probationary term of three years, if his deportment and progress have been satisfactory, he is rewarded with a commission as third lieutenant. An applicant for the posi-

tion of cadet engineer must not be less than 20½ years nor more than 25½ years of age and must pass the same physical examination as prescribed for line cadets. They are required to serve a probationary term of one year as cadet engineers at the Revenue Cutter Academy before being commissioned third lieutenants of engineers. Cadet engineers receive a salary of $720 per annum and one ration per day and must provide themselves with the prescribed uniforms.

The work of the Revenue Cutter Service, as defined by law, consists in the enforcement of about every statute bearing upon the maritime interests of the nation. Its duties embrace the protection of the customs revenue; the saving of life and property from marine disasters; the destruction of derelicts; the enforcement of the laws against smuggling, those pertaining to national quarantine, the neutrality laws, the navigation laws, including vessels' documents, and all requirements in regard to the rules for preventing collisions, officers' papers, steamboat inspection, and passenger service; the laws in suppression of piracy, robbery, and mutiny on the high seas; those for the protection of the seal fisheries and sea-otter hunting grounds in Alaska and for the prevention of illegal traffic in firearms, ammunition, etc., in that territory; the laws for the protection of wrecked property and the timber reserves of the United States; the laws for the suppression of the slave trade; those that require necessary life-saving appliances to be kept on board merchant vessels; the laws in regard to the anchorage of vessels in the ports of New York and Chicago, in the St. Mary's River, Michigan, etc., and the regulations to insure the safety of observers of and participants in regattas on navigable waters. Two revenue cutters are now annually detailed to patrol the ice fields in the North Atlantic during the months of March, April, May, and June. This patrol duty is done under international agreement, and the expenses are borne by the great maritime nations of the world. One revenue cutter is detailed to render medical and surgical aid to the men of the deep-sea fishing fleet in the North Atlantic. During the dangerous and inclement season, from December 1 to April 1 of each year, revenue cutters are, by direction of the President, required to cruise actively along the coast to afford aid to vessels in distress. Those detailed for such duty are provided with special supplies, including extra provisions for the shipwrecked, and are instructed to extend to all requiring relief such assistance as may be adapted to their condition and necessities. The cutters on the Great Lakes are, during the period of open navigation, charged with similar important work. An important function of revenue-cutter officers is their connection with the Life-Saving Service (q.v.). They are detailed to do the inspection work of the latter and to drill the surfmen in the use of life-saving apparatus and to see that the equipments of the stations are kept in efficient condition. Besides the fixed duties of the service there are numerous others which it is called upon to perform from time to time, such as aiding the Public Health and Marine Hospital Service, the Lighthouse Establishment, the Coast Survey, the Fish Commissioner, the ocean telegraph lines, etc. Each vessel has assigned to her a certain district, within which she carries out her specified duties. The districts on the Atlantic and Pacific seaboards and the Great Lakes are contiguous and therefore cover the entire coast of the United States.

On Jan. 28, 1915, the bill creating the Coast Guard by merging the then existing Revenue Cutter and Life-Saving services into one organization became a law. Hereafter this service will be administered by the captain commandant, under the direction of the Secretary of the Treasury, in time of peace. In war times the Coast Guard will automatically become a part of the navy and be under the administration of the Secretary of the Navy. Under the terms of the bill the former Life-Saving Service is placed upon a military basis, and its members can now be retired for age, 30 years' service, or for disability incurred in line of duty. The Coast Guard is defined by law to be a part of the military service of the government at all times.

REVER'BERATORY FURNACE. See COPPER, *Refining;* IRON AND STEEL; LEAD; METALLURGY.

REVERDIN, re-vĕr'dăN', JACQUES LOUIS (1842–1908). A Swiss surgeon, born at Frontenex. He studied medicine at Paris (M.D., 1870), and settled in 1872 in Geneva, where four years later he became professor of pathology and surgery at the University. With Emil Theodor Kocher (q.v.) he was the leading investigator in goitre. Reverdin was able to produce in 1882 experimental myxœdema (*myxœdème opératoire*) by total or partial extirpation of the thyroid gland and thus became, with Kocher and Schiff, the originator of oganotherapeutics He is the author of *Etude sur l'uréthrotomie interne* (1870); *Conférence sur l'extirpation du goître* (1886); *Contribution à l'étude de myxœdème* (1887); *De l'énucléation dans le traitement de goître* (1892); *Antisepsie et asepsie chirurgicales* (1895). Reverdin edited the *Revue Médicale de la Suisse Romande.*

REVERE, rē-vēr'. A city in Suffolk Co., Mass., adjoining Boston on the northeast, on the Boston and Maine Railroad (Map: Massachusetts, F 3). It is finely situated on the coast and is an attractive residential place and a summer resort. Revere Beach has a bathhouse built and maintained by the State, and a splendid beach of white sand which makes it one of the most popular bathing resorts on the Massachusetts coast. It has also a splendid boulevard. There are a handsome city hall and a Carnegie library. Revere was settled in 1626 and, under the name of Rumney Marsh, formed a part of Boston until 1738. Incorporated as Chelsea in 1739 and reincorporated as North Chelsea in 1846, it received its present name (in honor of Paul Revere) in 1871 and its city charter in 1915. Pop., 1900, 10,395; 1910, 18,219; 1915 (U. S. est.), 22,344.

REVERE, rā'vā-rā, GIUSEPPE (1812–89). An Italian poet, born at Triest. He wrote for *La Concordia,* a liberal journal of Turin, took part in the Cinque Giornate of Milan (1848), and afterward lived in Turin, Genoa, and Rome. He began his career with *Lorenzino de' Medici,* later utilized by A. Dumas (*Une nuit à Florence*), *I Piagnoni e gli Arrabbiati, Il Marchese de Bedmar,* literary dramas of historical realism, not destined for the stage. His verses, *Sdegno ed affetto* (1845), as well as his best work, *Marine e paesi* (1858), have a conscious affiliation with the mood and methods of Heine.

But he had also great ability as a humorist. Consult L. Cambon, *G. Revere* (Trieste, 1905).

REVERE', PAUL (1735–1818). An American patriot, born in Boston, Mass. He learned from his father the trade of a goldsmith and soon became skillful as an engraver on silverware. In 1756 he served as a lieutenant in the Crown Point expedition and, returning to Boston, established himself as a goldsmith and a copperplate engraver. He was a member of the grand jury which in 1774 refused to serve on account of the Act of Parliament making judges independent of the Legislature as regards salary. He engraved the plates and printed the paper money ordered in 1775 by the Provincial Congress and in the same year established a powder mill in Boston. He early took an active interest in the disputes with the English ministry, participating in the Tea Party (1773) and carrying the news of it to New York and Philadelphia, and in 1774 became a member of a society organized to watch the British in Boston. On April 18–19, 1775, at the request of Joseph Warren, he made his memorable midnight ride to Lexington to warn Hancock and Samuel Adams of the approach of English troops. Then, passing on towards Concord to warn the people there, he was captured by a party of British soldiers and was brought back to Lexington, where he was released on the next day. This ride has been the theme of a celebrated poem, "The Midnight Ride of Paul Revere," by Longfellow. Subsequently becoming lieutenant colonel of State artillery, Revere accompanied the unsuccessful Penobscot expedition in 1779. Consult C. F. Gettemy, *True Story of Paul Revere* (Boston, 1905).

REV'ERIE, or **REV'ERY** (Fr. *rêverie*, OF. *resveric*, from *resver*, *rêver*, *rever*, to rave, from Lat. *rabies*, rage, from *rabere*, to rage). A word borrowed from the French and somewhat loosely used to signify a state of mind obtaining during waking life and characterized by neglect of present surroundings, meditativeness, or abstraction. True reverie, like the dream of sleep, is marked by a condition of discursive, passive attention. There is, to be sure, abstraction, forgetfulness of one's environment, but the trend of consciousness is not towards any definite goal. Like the dream, too, the reverie is apt to be fleeting and easily forgotten. Its fancifulness and fleetingness are evidence of the lack of a determining tendency (q.v.). Consult James, *Text-Book of Psychology* (New York, 1892), and Carpenter, *Mental Physiology* (London, 1888). See ATTENTION; ASSOCIATION OF IDEAS; DREAMING; HYPNOTISM.

REVERS'ING LAYER. The gaseous layer of the solar atmosphere lying between the photosphere and the chromosphere (qq.v.). It was discovered by Young during the Spanish eclipse of 1870 Its temperature is lower than that of the photosphere, and consequently selective absorption takes place in the white light of the photosphere as it passes through the reversing layer, and the resulting spectrum is found to be a continuous one crossed by innumerable fine dark lines corresponding to the wave lengths absorbed. Many of these lines have been identified with those due to terrestrial elements, about 40 of which have thus been shown to be present in the sun. If the light from the limb of the sun is examined during a total eclipse through a spectroscope which has its slit arranged parallel to the limb, the spectrum obtained fades away as the moon advances over the sun's disk, and at the instant of totality the spectrum of the reversing layer flashes out as a series of bright lines occupying the positions of the dark lines of the effaced spectrum of the photosphere. It has been estimated that the thickness of the reversing layer is from 500 to 1000 miles. See SPECTROSCOPY; SUN.

REVER'SION (Lat. *reversio*, from *revertere*, to turn back, from *re-*, back again, anew + *vertere*, to turn; connected with Skt. *vart*, OChurch Slav. *vrŭtĕti*, *vratiti*, to turn, Goth. *wairþan*, AS. *weorþan*, OHG. *werdan*, Ger. *werden*, to become). A form of heredity (q.v.). Cases occur where an individual inherits not its parents' physical or mental characteristics, but those of its grandparents or more remote ancestors. This happens in cultivated plants and domestic animals artificially bred from wild forms. If such forms are neglected or return to free nature, i.e., 'run wild, they tend to revert, throw back, i.e., to transmit the characteristics of the original wild species or variety. Darwin remarks that reversion may be divided in two classes: (1) those occurring in a variety or race which has not been crossed, but has lost by variation some character that it formerly possessed and which afterward reappears; (2) all cases in which an individual with some distinguishable character, a race, or species, has at some former time been crossed, and a character derived from this cross, after having disappeared during one or several generations, suddenly reappears. He gives extensive examples in illustration and concludes that a tendency to atavism is "an integral part of the general law of inheritance." Consult J. C. Ewart, *The Penicuik Experiments* (London, 1899), and Charles Darwin, *Variation of Animals and Plants under Domestication* (authorized ed., 2 vols., New York, 1900). See ATAVISM; HYBRIDITY; MENDEL'S LAW.

REVERSION. The residue of an estate or interest remaining in a grantor of real property who has conveyed away one or more estates in it, amounting to less than a fee simple in quality and duration. Thus, where one seised of an estate in fee simple conveys the lands for life to another without making any final disposition of the fee, he is said to be seised of the fee in reversion. The reversion is classed as a future estate or, more accurately, as an estate of future enjoyment, and is said to arise by operation of law, i.e., without special act of the parties, and in this respect it differs from a remainder, which must be created by express words in a conveyance. Consult the authorities referred to under REAL PROPERTY. See REMAINDER.

REVERT'ER, POSSIBILITY OF. A species of reversionary interest or estate in real property, so named because of the extreme improbability of its ever ripening into or becoming an estate in possession. In early times the term was applied to the interest of a grantor who had conveyed either an estate in fee tail, i.e., an estate in the grantee and his lineal heirs, or a mere life estate; but, because of the remoter possibility of reversion when the fee had been disposed of, the term became restricted to the interest of the grantor in the event of the natural termination of an estate in fee tail. See LIMITATION OF ESTATES; and consult authorities under REAL PROPERTY.

REVET'MENT (Fr. *revêtement*, from *revêtir*, OF. *revestir*, to line, from *re-*, again + Fr. *vêtir*,

OF. *vestir*, to clothe, from Lat. *vestire*, to clothe, from *vestis*, garment). An important device in both permanent and field military fortifications. In the former it is usually a retaining wall of masonry, built for the purpose of holding back or strengthening the earth of which the works are composed. In the older permanent forts it was usually about 5 feet thick at the top and sloping outward as it descends (on the ditch side only) about 1 in 6. Additional strength was obtained by reënforcing the revetment wall by massive buttresses at intervals of 15 feet, called *counterforts*, and these again were sometimes connected and strengthened by masonry arches outside the revetment In field works the revetments are made of sods, sandbags, timber, brush woven or formed into hurdles, gabions, wattling or fascines, and even of masonry (q.v.). The revetments hold slopes more nearly vertical with consequent economy of material and increased protection for the troops in the trenches from indirect fire.

With the increase in the power of the attack, modern explosive shells will destroy most revetments, even if considerably strengthened. In view of this fact and of the great lengths of lines that must be built most field-fortification revetments are now of a simple economical type. See FORTIFICATION; REDOUBT; SIEGE AND SIEGE WORKS

REVETMENT, OF RIVER BANKS. See MISSISSIPPI RIVER.

REVETT, NICHOLAS. See STUART, JAMES (1713-88).

REVIEW' (OF., Fr. *revue*, from *revoir*, to review, from Lat. *revidere*, to see again, from *re-*, back again, anew + *videre*, to see). A military parade, followed by inspection and review, the latter usually consisting of a salute tendered to the reviewing officer as the troops "march past." This ceremony to-day is merely an exhibition of number, equipment, bearing, discipline, physique, and general condition and consequently is treated almost exclusively as a compliment to a distinguished visitor or as the finale to a field day.

REVIEW. See PERIODICAL.

RÉVILLE, rā'vēl', ALBERT (1826–1906). A French Protestant clergyman and author, born at Dieppe (Seine-Inférieure). He studied at Dieppe, Geneva, and Strassburg; was for a time vicar at Nîmes, later pastor at Luneray, near Dieppe, and in 1851 became pastor of the Walloon Church at Rotterdam. In 1873 he returned to Dieppe, where he pursued philosophical studies until 1880. Thereafter till his death he was professor of the history of religions in the Collège de France. He also became president of the section of religious sciences in the Ecole Pratique des Hautes Etudes. Réville ranks as one of the most advanced representatives of the French liberal Protestantism of his time. His publications include a translation (1849) of Whately's *Introductory Lessons on the History of Religious Worship* (London, 1849); *Essais de critique religieuse* (1860; 2d ed., 1869); *Manuel d'instruction religieuse* (1863; Eng. trans., 1864); *Théodore Parker, sa vie et ses œuvres* (1865; Eng. trans., 1865); *Histoire du dogme de la divinité de Jésus-Christ* (1869; 5th ed., 1906; Eng. trans., 1870, revised 1905); *Histoire du diable* (1870; Eng. trans., 1871); *Douze sermons* (1874); *Prolégomènes de l'histoire des religions* (1881; Eng. trans., 1884); *Histoire des religions* (1883–85; Eng. trans., 1884), his most extensive and important work.

REVILLOUT, rā'vē'yōō', EUGÈNE (1843–). A French Egyptologist, born at Besançon. He was educated for the Church, but preferred Oriental studies, entered the department of Egyptian antiquities at the Louvre as an assistant in 1869, aided in founding the Ecole du Louvre in 1880, and in 1881 became professor and curator of the Egyptian collection of that museum. Revillout's great work was the publication of the *Chrestomathie démotique* (1878–80), supplementing Brugsch's discoveries in the demotic language. Besides, he specialized on Egyptian law, founded, with Brugsch and Chabas, the *Revue Egyptologique* in 1880, and published: *Actes et contrats des musées égyptiens de Boulaq et du Louvre* (1876); *Apocryphes coptes* (1876); *Le roman de Setna* (1880); *Etude complémentaire du cours de droit égyptien* (1884); *Corpus Papyrorum Ægypti* (1885–1902); *Cours de droit égyptien* (1885); *Cours de langue démotique* (1885); *Lettres sur les monnaies égyptiennes* (1895); *Mélanges sur la métrologie, l'économie politique et l'histoire de l'ancienne Egypte* (1895); *Précis du droit égyptien* (1899–1903); *Le procès d'Hermias* (1903); *L'Ancienne Egypte* (1908–09); *Les origines égyptienne du droit civil romain, nouvelle étude* (1912).

REVISED STATUTES. One of the forms in which the enactments of legislatures are published. In England it signifies a reprinting in chronological order of statutes in force, eliminating those which have become obsolete. In the United States it signifies not merely an elimination of useless material, but a rearrangement and systematization of the residue, bringing together laws relating to the same subject. In some States the expression is, however, not used with precision. English and American revisions have the common characteristic of presenting living laws in a more convenient form than that in which they were originally published.

The acts of legislative bodies are printed and bound into volumes at the end of each session and are then known as session laws. If there is more than one session of a given legislature, the laws passed at all sessions are usually republished, with a new title-page and indexes, and are then known as statutes at large. They include all acts whether general or local in character. As the number of these volumes increases the difficulty of determining what is the law on any subject increases, not only on account of the mechanical labor involved, but also because many laws have been repealed or amended or have become inapplicable to present conditions. In the United States there are three methods of meeting this situation—to codify, revise, or compile the laws. (See CODE.) In any case private and local acts are omitted from the new publication. Codification is the most thorough of the three, while compilation is a mere rearrangement of laws in force. Revision is "such a modification and amendment of the statute laws in existence, in addition to their rearrangement, as would render them consistent among themselves and in harmony with the constitution of the State. And when so amended, modified, and arranged, they are to be reported to the Assembly for adoption or modification." (27 Arkansas, 266.) The last revision of the laws of the United States Congress was published in 1878. Two supplementary volumes carry the revision to 1901. Nineteen States have chosen to issue revised statutes, the remainder preferring either codes or compilations. The

revision is usually intrusted to agencies appointed by the Governor with or without the consent of the Senate, by one or both Houses of the Legislature, or by the Supreme Court. Some States leave the work to private enterprise, afterward adopting the work as their own. The period between revisions in some States has been as long as 20 years.

The last revised edition of the Laws of England was prepared by the Statute Law Committee and published by authority, 1888–1900, 20 volumes. The obsolete laws were cleared from the statute books by repeal bills passed on the recommendation of the Statute Law Committee before the revision was published. Consult for England, Sir C. P. Ilbert, *Mechanics of Law Making* (Oxford, 1914); and for the United States, "Revisions and Codes" in *American Law Review*, vol. xlviii (St. Louis, 1914).

REVIVAL OF LEARNING. See HUMANISM; RENAISSANCE.

REVIV'ALS (from *revive*, from Lat. *revivere*, to live again, from *re-*, back again, anew + *vivere*, to live), RELIGIOUS. A term widely used among Protestants since early in the eighteenth century, to denote periods of marked religious interest, when church members are quickened to a new sense of responsibility and privilege and others are for the first time brought openly to profess their faith. By an extension of its meaning the term is sometimes applied to various important religious movements of the past, like that of the Day of Pentecost (Acts ii), of the Wiclifites in England, the Hussites in Bohemia, and the Reformers of the sixteenth century. In a similar way it might be used of the religious zeal which led to the First Crusade, the work of the great monastic orders in some periods of their history, the Oxford movement, and so on. But it is more accurate and better to limit the application of the term "revival" to the history of modern Protestantism, especially in Great Britain and America, where such movements have flourished with especial vigor. Yet in so doing one should not forget that there were similar revivals of religion in Scotland as early as the end of the sixteenth century (under Wishart, Cooper, and Welsh), and again, both there and in the north of Ireland, about a generation later, when Bruce and Livingston were prominent as leaders (the Stewarton movement).

Seasons of religious quickening occurred in the Colony of Massachusetts Bay between 1704 and 1718, but in importance and influence they were far overshadowed by the work of Jonathan Edwards (q.v.) at Northampton in 1734. His preaching so deeply affected his hearers that about 300 persons were converted. The movement spread through a large part of New England in the next two years and formed a suitable introduction to the Great Awakening, a revival which extended through almost all the Colonies and influenced either directly or indirectly almost all the churches. This movement began about the same time as that of John Wesley in England. Its most active agent was George Whitefield (q.v.), a preacher of singular power and inexhaustible energy, who came from England to America in 1739 and traveled through the country, preaching in the open air to audiences of thousands and winning a large number of converts. The Great Awakening proper occupied the years 1740–42. Several evangelists were enlisted in its service, notably the zealous but censorious Gilbert Tennent (q.v.), a Presbyterian, who had begun revivalist work in New Jersey before Whitefield's arrival. Among the most obvious results of the Awakening were the addition, between 1740 and 1760, of 150 churches to the number already established in New England and the doubling of the number of Presbyterian ministers in the middle Colonies. Princeton College grew out of the movement, and the plan for a school for the education of the Indians was conceived about the same time, from which later came Dartmouth College (q.v.). The Wesleyan movement did for England what the Great Awakening did for America, but with a new and permanent ecclesiastical organization as its product.

Towards the end of the eighteenth century a fresh series of revivals began, lasting intermittently from 1797 to 1859. The beginning of this long period was called in New England the "evangelical reawakening." The work was carried on at first by parish ministers, not by traveling evangelists, and the churches soon came to depend upon revivals for their growth and even for their life. As time went on, the work was taken up by itinerant preachers also. Among the prominent leaders were Nathan Strong, Edward Dorr Griffin, Jeremiah Hallock, Timothy M. Cooley, Lyman Beecher, Asahel Nettleton, and Charles G. Finney. The early years of the nineteenth century were marked by great missionary zeal, reaching out beyond the boundaries of New England and even to foreign lands. See MISSIONS, CHRISTIAN.

Towards the southwest, in Tennessee and Kentucky, we meet for the first time with camp meetings, great open-air assemblies, which since 1800 have played an important part in the evangelistic work of the Methodist church. (See CAMP MEETING.) Ministers of other denominations at first participated in this movement, special sympathy being manifested by the Presbyterians, but the extreme excitement soon alienated them from it. A considerable number of Presbyterians, however, who continued to believe in the revival theory as there illustrated, withdrew from communion with the main body and formed the nucleus of what has since become the Cumberland Presbyterian Church. (See PRESBYTERIANISM.) One of the most valuable products of the camp-meeting idea is the Chautauqua Assembly, a highly successful educational enterprise, still closely connected with religious work. (See CHAUTAUQUA INSTITUTION.) One of the most noteworthy revivals of the whole series was that of 1858–59, which, like the Great Awakening, affected nearly all branches of Protestantism and was nowhere more successful than in New York City. No account of modern revivals would be complete without prominently mentioning the work of Dwight L. Moody and his singing associate, Ira D. Sankey (qq.v.), who for many years after 1870 exerted a large influence in Great Britain and America, reaching all classes of society.

What is commonly called the revival period of American religious history may be said to have closed soon after the middle of the nineteenth century. Horace Bushnell's work on *Christian Nurture*, published in its completed form in 1861, was undoubtedly a sign of the changing religious temper. Men's minds were turning to other ways of extending the Church's influence as being at once more normal and more promising. The establishment of several theological schools, like Andover, Bangor, Hamilton, Newton, and others, due largely to the interest evoked

by the revivals early in the century, tended to promote this very change.

At the same time revivals have not wholly disappeared The great Welsh revival of 1904–06 was a spontaneous expression of religious life which won many converts and morally transformed certain places. In America organized evangelistic campaigns have sometimes had great success, under the leadership of professional evangelists, among whom have been J. Wilbur Chapman, R. A. Torrey, "Gypsy" Smith, "Sam" Jones, and "Billy" Sunday.

Although revivals mark a temporary departure from the historic method of propagating Christianity, which is by religious training accompanying the sacrament of baptism, yet they are a natural incident in the development of Protestantism.

Stead, *The Revival in the West* (London, 1905) The most valuable study of a revival is still Jonathan Edwards, *Narrative of the Work of God in Northampton* (1756).

REV'OCA'TION (Lat. *revocatio*, from *revocare*, to revoke, recall, from *re-*, back again, anew + *vocare*, to call). In law, the annulling, vacating, or cancellation of a legal instrument with intent to make it null and void in effect, or the withdrawal of an authority previously conferred. Where an instrument is made in good faith and without wrongfully affecting the rights of third parties, it is generally held to be irrevocable if it conveys property or rights to some one who pays for the same or accepts them as a gift.

The term is also applied to the recall of a right in real property created by license of the owner or occupier, and to the transfer of an estate in land by one who enjoys a "power of appointment" with reference thereto, such right being sometimes described as a power of revocation and appointment. See LICENSE; POWER; POWER OF APPOINTMENT.

REVOLT OF ISLAM, THE. A poem by Shelley (1818). The original title was *Laon and Cythna*, the names of the chief characters of the story.

REV'OLU'TION (Lat. *revolutio*, from *revolvere*, to turn over, from *re-*, back again, anew + *volvere*, to turn; connected with Goth. *walwjan*, AS. *wealwian*, Eng. *wallow*). In politics, a radical change in the fundamental constitution of a state, as opposed to reform, which implies a gradual transformation carried out in accordance with established principles and through legal forms. Usually, though not of necessity, it connotes a popular upheaval in which the will of the masses replaces for the time all laws and authority. The history of every nation presents instances where the organic growth of years and centuries has within a brief space of time been altered or destroyed by a people that has lost faith in the efficacy of orderly evolution. The English Revolution of the seventeenth century once for all established the rights of Parliament as against those of the King. The American Revolution, so called, freed the united English Colonies on the Atlantic seaboard of North America from the sovereignty of the English crown and made them free and independent States. The French Revolution (q.v.) of 1789 overthrew the Bourbon monarchy and after three generations of sequential struggles brought in the sovereignty of the French people. It also produced a profound effect on the constitution of society and the relation of peoples and sovereigns throughout Europe. By the Industrial Revolution (q.v.) is meant a fundamental change in the method of production from the domestic system worked by hand labor to the factory system operated by machinery. Consult, on the technical aspect of revolutions in the science of politics, J. W. Burgess, *Political Science and Comparative Constitutional Law* (new ed., 2 vols., Boston, 1902), and John Locke, *Treatise on Civil Government* (new ed., London, 1903); also, W. S. Lilly, *A Century of Revolution* (2d ed., ib., 1890) On its historical aspects, see the history of different nations.

REVOLUTIONARY TRIBUNAL. The name given to the court for the trial of political offenses instituted by the French Convention on the night of March 10, 1793. Danton and his associates considered that such a court had become necessary, inasmuch as the disasters which had befallen the national armies on the frontiers had led to dangerous conspiracies against the revolutionary government. Its members were chosen from the various departments, and their appointment was ratified by the Convention. Their function was to sit in judgment on all persons accused of crimes against the state, and from their sentence, delivered with appalling promptitude, there was no appeal. During the Reign of Terror, when Fouquier-Tinville (q.v.) was the public prosecutor, this tribunal acquired a fearful notoriety by doing away with almost all forms of justice and making itself the willing instrument of the Committee of Public Safety. After several changes in organization the Revolutionary Tribunal was finally abolished, May 31, 1795. See FRENCH REVOLUTION.

REVOLUTIONARY WAR. See UNITED STATES.

REVOLVER, MILITARY. A weapon all but obsolete in practical service, but once extensively used and of much disputed value, as was shown by its varying relative importance in the armies of the world. It perhaps found a greater sphere of usefulness in the United States cavalry than with any other troops in the world. The ordinary range of usefulness of the revolver is practically limited to 50 yards, the weapon itself being required to be strong enough to stop a man and, if possible, a horse. The proper calibre was long a puzzling problem, the proper solution depending on the intended use as well as convenient size and weight. The calibre .38 revolver used by the United States army until replaced by the calibre .45 pistol, fired a bullet lighter by nearly 30 grains than that of any other power, with the exception of those used by the Swiss dismounted officers, French officers, and the re-

volvers of the Russian model. This revolver gave excellent service for troops in the United States, but proved to be not sufficiently powerful for use in Philippine campaigns.

The calibre .38 revolver is provided with a revolving cylinder containing six chambers, and, in order to facilitate the loading of cartridges and the simultaneous ejection of the emptied shells, the cylinder is mounted upon a crane pivoted in the frame below the cylinder, so that on drawing the cylinder latch to the rear the cylinder swings to the left and downward out of its seat in the frame. Thus, all the chambers are exposed for loading, while the pressure against the end of the ejector rod under the barrel forces out the shells. This done, the cylinder is returned to its position in the frame and is automatically secured by the cylinder latch.

A similar type of revolver is the Smith and Wesson, which is equipped with an automatic shell ejector, so that when the revolver is opened by its clasp the barrel and cylinders tip downward, an action which simultaneously ejects the empty shells. This mechanism is one of the most important inventions ever made in connection with revolvers, and it has been adopted by practically all the revolver manufacturers throughout the world since the patents covering the invention expired. The Army Model No. 3, as made by Smith and Wesson, weighs 2½ pounds, is central fire, with a calibre of .44. It takes six cartridges and has a length of barrel of 6½ inches.

All modern pistols and revolvers use metallic cartridges. England adopted the Mark IV .445 Model revolver of the Webley and Scott Revolver Company in 1893 for the exclusive use of the British army and navy as well as the Indian and colonial forces. It weighs 2 pounds 3 ounces and has a 4-inch barrel. The cylinder may be locked or free as desired. The weapon combines the trigger action with the cocking action.

As stated under PISTOL (q.v.), the revolver supplanted the old single-loading pistol and recently has been supplanted by the automatic pistol in practically every country. This new weapon possesses greater power, carries more rounds in its magazine, and can be reloaded more rapidly. The calibre is generally above .40. See Plate with PISTOL.

REVUE DES DEUX MONDES, *re-vụ' dâ dē mōNd* (Fr., Review of the Two Worlds). The most important French magazine, founded in 1831 by F. Buloz and conducted for a long time by Brunetière and after his death by Francis Charmes.

REWA KANTHA, *rā'wä kän'tà*. A political agency, India, subordinate to the government of Bombay. The agency controls 61 native states situated in the region of the Narbada (Rewa) and Mahi rivers. Total area, 4972 square miles. Pop., 1901, 479,065; 1911, 665,099. The principal towns are Nandod, Balasinor, and Lunavada.

REWARD (OF. *rewarder, reswarder, reguarder, regarder,* to regard, from *re-*, back + *warder, garder,* to watch, mark, heed, guard, from OHG. *wartēn,* Ger. *warten,* AS. *weardian,* Eng. *ward;* connected ultimately with Gk. *ὁρᾶν, horan,* to see). A compensation or premium offered by a government or a private individual to the public in general for the performance of a particular act specified therein In England statutes forbid the offering or receiving of a reward for the return of stolen property under conditions protecting or sheltering the thief. In the United States compounding a felony is a crime, but the English statute prohibiting the receiving back of property believed to have been stolen, without investigation, is not generally followed. The offer of a reward may be made verbally, by writing, or in the newspapers, and when made to the public at large may be accepted by any one who may see the offer. The various States differ as to whether one performing the service without having seen or having knowledge of the offer is entitled to the reward. Where the offer of a reward is made in the newspapers, it may be withdrawn or revoked in the same way, and one who saw the offer, but did not see the revocation and performed the service called for, is not entitled to recover, providing the performance did not antedate the publication of the revocation. The general principles of unilateral contracts govern. One who goes to great trouble and expense to get the desired information, but does not succeed in doing so until after the offer is revoked, is without remedy. A police officer cannot recover a reward offered for the detection of a criminal if his efforts were in the line of his duties; but if his services were not in any sense official and were performed in his leisure time, he may claim such a reward just as any other individual could do. Consult the authorities referred to under CONTRACT.

REWARI, or **RIWARI,** *rē-wä'rē*. The chief commercial town of the District of Gurgaon, Punjab, British India, 48 miles southwest of Delhi, at the junction of two railways (Map: India, C 3). It has a fine town hall, handsome Jain temples, and the interesting ruins of the fort of Gokulgarh. It is an important grain-distributing centre; sugar and salt are also exported, and great quantities of iron are imported for manufacturing purposes. Rewari dates from about 1000 B.C., when it was built near the site of an older town. Pop., 1901, 27,300; 1911, 26,920.

REWBELL (or REUBELL), *rē'bĕl',* JEAN FRANÇOIS (1747–1807). A French politician, born at Colmar, Alsace. He practiced law, became president of the corporation of advocates, and was elected as a deputy of the Third Estate to the States-General for the District of Colmar. In 1791 he became president of the Assembly, afterward was general secretary to the Directory of Haut-Rhin, and in 1792 was elected to the Convention. He was an opponent of the Jacobin Club, to whose suppression in November, 1794, he greatly contributed; was a member of the Committee of Public Safety; and was elected to the Council of Five Hundred. In November of 1795 he became a member of the Directory, of which he was president (1796–99). He sat in the Council of Ancients, but after the coup d'état of the Eighteenth Brumaire (Nov. 9, 1799) withdrew from public life.

REY, JACOBUS HENDRICK DE LA. See DE LA REY, J. H.

REY, NICHOLAS. See REJ, MIKOLAJ.

REYBAUD, *rā'bō',* LOUIS (1799–1879). A French author and politician, born at Marseilles. From 1846 to 1848 he was a deputy from Marseilles. In 1850 he became a member of the Academy of Sciences. Besides editing a *Histoire scientifique et militaire de l'expédition française en Egypte* (10 vols., 1830–36), he published *Etudes sur les réformateurs ou socialistes modernes* (1840; 7th ed., 1864), which won the Montyon

prize; a satirical romance entitled *Jérôme Paturot à la recherche d'une position sociale* (1843), which had a great success; a satire on revolutionary ideas, *Jérôme Paturot à la recherche de la meilleure des républiques* (1848); about 20 novels; several books on the industry of Europe; *Mœurs et portraits du temps* (6 vols., 1853); *Scènes de la vie moderne* (1855); etc.

REYE, rē'e, THEODOR (1838–). A German mathematician, born at Cuxhaven and educated at Hanover, Zurich, and Göttingen (Ph.D., 1861). He was instructor and professor at the Polytechnikum at Zurich until 1870, when he became professor of geometry at the Technische Hochschule of Aachen. Two years later he was appointed professor at Strassburg and in 1908 retired. Reye became known as one of the chief exponents of pure geometry as developed by Steiner and Von Staudt. He is author of *Geometrie der Lage* (2 vols., 1868; 4th ed., 3 vols., 1899–1907); *Die Wirbelstürme, Tornados, und Wettersaulen* (1872); *Synthetische Geometrie der Kugeln* (1879); *Die synthetische Geometrie in Altertum und in der Neuzeit* (1886; 2d ed., 1899).

REYER, rā'yâr', (LOUIS ETIENNE) ERNEST (1823–1909). A French composer. His real name was Rey. In 1850 he produced *Le Sélam*, a symphonic ode with chorus, set to a poem by Théophile Gautier. Several operas followed, one of the most conspicuously successful being *La statue* (1861). He was elected to the Académie in 1876 and about the same time succeeded Berlioz as librarian at the Paris Opéra. In 1862 he was made Chevalier of the Legion of Honor and Officer of that order in 1886. His compositions include operas, *Maître Wolfram* (1854), *Erostrate* (1862), *Sigurd* (1884), *Salammbô* (1890); cantatas, *Victoire* (1859), *L'Union des arts* (1862), *L'Hymne du Rhin;* male choruses; and a mass. Consult A. Pougin, *Musiciens du XIX siècle* (Paris, 1911), and H. Roujon, *Notice sur la vie et les travaux de E. Reyer* (lib., 1911).

REYES, rā'yās', BERNARDO (?–1913). A Mexican soldier, born in Nuevo León of a wealthy family. He was educated in France, entered the army, and rapidly rose to the rank of general. One of the ablest officers of the Díaz régime, he did much towards the development of the army. He became Governor of the State of Nuevo León and for a time was Minister of War and Marine. Eventually, however, Díaz began to suspect him, and after Reyes had headed a revolt he was banished (1909). He adhered to the movement of Madero (q.v.) in 1911 and after the triumph of the latter was a candidate for the presidency, but withdrew before the election. Later Reyes was arrested in San Antonio, Tex., for violating the neutrality laws, but was released. He returned to Mexico and tried to start a revolt, but failed and surrendered to the Madero government (December, 1911). In February, 1913, he was released from prison in Mexico City by the revolting cadets and, with Felix Díaz, headed the uprising against Madero. He was killed in the bloody fighting which ensued. See MEXICO, *History.*

REYES, RAFAEL (1852–). A Colombian statesman and soldier, born at Santa Rosa de Viterbo, Boyaca. With his brother he carried on extensive explorations over a large part of South America and added greatly to geographical knowledge. He was always active in politics and took part in the numerous internal struggles of the country. In 1885 he commanded the government forces during the uprising of that year. He was Minister of the Interior under President Núñez, Minister Plenipotentiary of Colombia to France and Switzerland, and delegate to the second Pan-American Conference in Mexico. He represented his government in the negotiations with the United States concerning the Panama Canal in 1904. The same year he was elected President of Colombia. During his administration he reëstablished order in the Republic, revived the nation's credit abroad, improved the administration of justice, reorganized the system of public instruction, and fostered the development of railways and public works. The people objected to his dictatorial policy, and he resigned in 1910. Afterward he endeavored to promote Pan-American friendship. His writings include: *Misión del Rafael Reyes* (1908); *Pro Colombia, Pro Ibero-América* (1912); *The Two Americas* (1914).

REYKJAVÍK, rā'kyà-vēk'. The capital of Iceland, situated on the southwest coast of the island at the head of the Faxa Fiord (Map: Denmark, E 1). The houses are of wood, stone, or béton. It has a small cathedral, a university, a classical college, a theological seminary, and a medical school. Here is the house of the Althing, a museum, containing a library, a collection of Icelandic antiquities, a collection of natural-history objects, the archives, and a picture gallery. During the summer there is steam communication with Copenhagen. Pop., 1901, 6682; 1911, 11,593.

REYNARD (rā'nērd) **THE FOX.** The greatest mediæval beast epic, in which animals become the mouthpieces of human society. Versions of this epic are found in the chief languages of western Europe. The narrative is made up of stories derived from European folklore and of more or less literary survivals of the Æsopic fable. Though the first extant signs of the epic date back to 940 (*Ecbasis Captivi*), the various elements of the tale did not group themselves into a whole until the twelfth century. In the Latin *Isengrimus*, which is, however, mainly of literary origin, the animals already have specific names. The principal character is Reynard (from the Germanic Raginohard, meaning "the wily, the crafty one") the fox, whose deadly enemy is Isegrim (probably German *eisen* and *grimm*, signifying "strength," "endurance") the wolf. About these two and their bitter feud are found grouped Noble the lion, Bruin the bear, Tibert the cat, Baldwin the ass, Chanticleer the cock, Kyward the hare, etc. The fact that *Isengrin* was used in 1112 as the epithet of a man (one of the conspirators against Gaudry, Bishop of Laon) shows that the tale was popularly current at an early date. The French *Roman de Renard*, a lost version of which was probably the source of most of the other European versions, is a cycle of episodes in octosyllabic verse, compiled by various authors at various epochs. The narrative is there divided into "branches," 30 in number, which together constitute over 30,000 verses. The oldest manuscript of this compilation is of the end of the thirteenth century, but we have a German poem of the twelfth century, modeled on an earlier version of the same French work. Various "Trouvères" attempted to give shape to this material, though the romance never attained genuine unity. The names of three alone of these compilers have been handed down: Pierre de Saint-Cloud, Richard de Lison, and a

clerk who called himself *Prestre de la Croix en Brie*. These names indicate that the Ile de France, Champagne, Normandy, and Flanders are the localities where the various parts of the poem took shape.

In the fourteenth century the story was again taken up and given a number of remodelings on French soil; chief among these are *Renart le Nouvel*, by Jacquemard Gelée, and the famous *Renart le Contrefet*, by an unknown clerk of Troyes. Here the romance has become a veritable compendium of moral, historical, and political ideas expounded by Reynard in conversation.

The romance was very popular in foreign lands It was translated into Middle High German in 1180 by the minnesinger Heinrich der Glichesäre; it was imitated in Catalonia by Raymond Lully and given an English form (published by Caxton) and a Flemish form. Goethe modernized the German version in his *Reinecke Fuchs* (translated by T. J. Arnold). Mediæval art delighted in depicting scenes from *Renard*.

For a detailed bibliography, consult Ernest Martin, *Le roman de Renart* (Strassburg and Paris, 1882–87), and Potvin, *Le roman du Renard* (Paris, 1891). The best edition of the French version is that of Martin, given above; the German *Reinhart Fuchs* is edited by Reissinger (Halle, 1886), the Flemish verse version *Reinaert de Vos*, by Van Helten (Groningen, 1887), and Caxton's English version is edited by W. J. Thoms, for the Percy Society (London, 1844); a modern English edition is by Thomas Cartwright (New York, 1908). For questions of sources, etc., Léopold Sudre, *Les sources du roman de Renart* (Paris, 1893); F. S. Ellis, *History of Reynard the Fox* (London, 1894); Joseph Jacobs, *Reynard the Fox* (ib., 1895), Gaston Paris, "Le roman de Renard," in the *Journal des Savants* (Paris, 1895); Leopold Sudre, in Petit de Julleville, *Histoire de la langue et de la littérature française*, vol. ii (ib., 1896); also Thomas Carlyle, "On German Literature of the Fourteenth and Fifteenth Centuries," in the *Foreign Quarterly Review* (London, 1831).

REYNAUD, rā'nō', JEAN ERNEST (1806–63). A French philosopher and author, born at Lyons. He was educated at the Ecole Polytechnique and was at first a mining engineer, but came into public notice as an opponent of Saint-Simonism, his previous creed, in a series of articles in the *Revue Encyclopédique*. His chief work, *Terre et ciel* (1854; 4th ed., 1864), is a résumé of the ideas he had already set forth in the *Encyclopédie nouvelle*, which he and M. Pierre Leroux had founded in 1835. He published also *Minéralogie des gens du monde* (1834); *L'Esprit de la Gaule* (1847; 2d ed., 1864); *Vie et correspondance de Merlin de Thionville* (1860); *Œuvres choisies* (1865).

REYNOLDS, rĕn'oldz, EDWIN (1831–1909). An American engineer, born at Mansfield, Conn. He served as general superintendent of Stedman & Co. at Aurora, Ind., in 1857–61, and of the Corliss Steam Engine Company at Providence, R. I., in 1871–77. Thereafter he was chief engineer and director of the Edward P. Allis Company and of the Allis-Chalmers Company at Milwaukee and Chicago. He was the inventor of the Reynolds-Corliss engine. In 1901 Reynolds was president of the Society of Mechanical Engineers.

REYNOLDS, JAMES EMERSON (1844–). An Irish chemist, born in Booterstown, County Dublin, and educated at Dublin University. He was chosen professor of chemistry to the Royal Dublin Society in 1870, to the Royal Irish College of Surgeons in 1873, and in Dublin University in 1875–1903. He served as president of the Society of Chemical Industry (1891), of a section of the British Association (1893), and of the Chemical Society, London (1902–03), and as vice president of the Royal Society in 1902. Reynolds discovered thiocarbamide and many other compounds of the same class and published *Lectures on Experimental Chemistry* (1874); *General Experimental Chemistry* (1880).

REYNOLDS, JOHN. See RAINOLDS, JOHN.

REYNOLDS, JOHN FULTON (1820–63). An American soldier, born at Lancaster, Pa. He graduated at West Point in 1841, was assigned as brevet lieutenant to the artillery, and during the Mexican War participated in the defense of Fort Brown, Tex., and the battles of Monterey and Buena Vista. At the outbreak of the Civil War he was commandant at West Point. He was commissioned brigadier general of volunteers in August, 1861, and was given a brigade of the Pennsylvania Reserve Corps before Washington. He took part in the seven days' battles before Richmond, showed brilliant tactics at Beaver Dam Creek, but was later captured at Gaines's Mill and afterward exchanged. The next year he took part in both the Peninsular and Northern Virginia campaigns and during the succeeding Maryland campaign commanded the Pennsylvania Volunteer Militia for the defense of his native State. In November he was given the command of the First Corps of the Army of the Potomac and was promoted major general of volunteers. He led the main attack on the Confederate left at Fredericksburg and at Gettysburg arrived on the field about two hours after the fighting had begun on the first day of the battle and was in chief command on the field until late in the morning (July 1), when he was shot and instantly killed by a Confederate sharpshooter

REYNOLDS, JOSEPH JONES (1822–99). An American soldier, born at Flemingsburg, Ky. He graduated in 1843 at West Point, where from 1846 to 1855 he was a member of the faculty In 1857 he became professor of mechanics and engineering at Washington University, St. Louis, but three years later gave up this position to become a merchant at Lafayette, Ind. At the outbreak of the Civil War he entered the Federal service as colonel of the Tenth Indiana Volunteers and a month later was commissioned brigadier general of United States Volunteers. In January, 1862, he again resigned, in August was again commissioned colonel, and in September was again promoted brigadier general. In November he was promoted major general and in 1863 participated in the battles of Chickamauga and Chattanooga. From Jan. 6 to June 16, 1864, he commanded the defenses of New Orleans, was in charge of the Department of Arkansas (1864–66), was mustered out of the volunteer service in the latter year, and was reappointed colonel of the Twenty-sixth Regular Infantry. A year later he was brevetted major general and in 1877 retired from active service.

REYNOLDS, SIR JOSHUA (1723–92). The principal founder of the school of English portrait painting. He was born at Plympton, Devonshire, July 16, 1723. His father, the Rev. Samuel Reynolds, rector of Plympton St. Mary, and master of the grammar school, intended his

son for the medical profession. But in 1741 Joshua, who from an early age had manifested an ardent desire to be a painter, was placed under Hudson, the principal portrait painter of the day. After being in the studio of this artist two years he began on his own account to paint portraits at Plymouth Dock, now Devonport, and met with great encouragement. In 1745 he went to London and established himself in St. Martin's Lane, but on the death of his father, in 1746, he returned to Plymouth Dock. Upon the invitation of Commodore Keppel, who was in command of the Mediterranean squadron, he sailed for Italy from Plymouth in 1749 and on his arrival in Leghorn proceeded to Rome. He stayed about three years in Italy, most diligently employing his time in visiting the various cities where the chief art collections are to be found. Upon his return to London in 1752 his works attracted great attention, eclipsing everything that had been done there since Van Dyck's time. When the Royal Academy was instituted in 1768, he was elected president; he was knighted by George III and on Ramsay's death, in 1784, succeeded him as painter to the King. He founded the Literary Club (1764) for Dr. Johnson's benefit. To him Goldsmith dedicated his *Deserted Village*. He died in his palatial house in Leicester Square on Feb. 23, 1792, and after lying in state at the Royal Academy was interred in the crypt of St. Paul's.

Sir Joshua was very prominent in the social world and lived in friendly intercourse with Johnson, Burke, Goldsmith, Gibbon, Garrick, and other leading men of his period. His principal literary works consist of 15 *Discourses before the Royal Academy* (1778), treatises on the history of art of a high critical and artistic value. They are written in a precise good style and inculcate those maxims of art commonly known as academic.

Of formative influence in Reynolds's art were the great Italian masters, especially the Venetians, Correggio, the Bolognese Eclectics, and Michelangelo. He was much of an eclectic himself, and there was little that was strikingly original about his work. His composition and brushwork were learned, but his drawing, especially of the limbs, was often faulty. The strong point of his paintings was their color, showing the influence of Titian; but Sir Joshua's technical experiments had a disastrous result upon their preservation. His portraits are admirable realistic representations; the men are strong in action and character, the women gentle and attractive, the children innocent and natural. They form an epitome of London society of his day.

He is estimated to have painted from 2000 to 3000 portraits, most of which are in English private collections. The National Gallery, however, possesses a number of his best works, including those of Admiral Keppel, Lord Heathfield (the hero of Gibraltar), Goldsmith, Dr. Johnson, Garrick, the members of the Dilettante Society, and three portraits of himself. The National Portrait Gallery (London) and the Royal Academy are rich in his works, as are also the London private galleries and the University of Oxford. Especially worthy of mention are the portraits of Lady Cockburn and her children, the Duchess of Devonshire (Devonshire House), Nelly O'Brien (Hertford House), and "Mrs. Siddons as the Tragic Muse" (Dulwich Gallery).

Although Sir Joshua preferred historical painting, his works of this character are less important. There are good examples in the Hermitage collection, St. Petersburg, including the "Continence of Scipio"; the best, perhaps, is "Ugolino and his Sons in the Tower." Among his few genre pictures are the "Girl with the Mouse-trap" (Holland House) and the "Strawberry Girl." His beautiful and well-known "Angels' Heads" (National Gallery) are in reality portrait studies.

During the past decade many excellent examples of Reynolds's work have come into American possession. In the Metropolitan Museum, New York, are thirteen, including Master Hare, Mrs. Baldwin, and Lady Carew. The Morgan collection, on loan at the Metropolitan Museum, has two others, including Lady Betty Delmé and her children, excellent alike in composition and in color. The New York Public Library possesses Mrs. Ballington as St. Cecilia and two others. Among the best examples in private collections are Lady Milnes, Miss Finch-Hatton, and Miss Frances Harford in the Frick collection, New York, Sir John Read, Elkins collection, Philadelphia; Caroline, Viscountess Clifden, and her sister (H. C. Huntington, New York); Mrs. Clayton Glyn (Mrs J. P. Morgan, New York); Lady Bunbury (Mrs. W. W. Kimball, Chicago).

Molloy, *Sir Joshua and his Circle* (2 vols., ib., 1906); Max Osborn, "Joshua Reynolds," in *Kunstler-Monographien* (Bielefeld, 1908).

REYNOLDSVILLE, rĕn'ŏldz-vĭl. A borough in Jefferson Co., Pa., 120 miles by rail northeast of Pittsburgh, on the Pennsylvania, the Reynoldsville and Falls Creek, and the Lake Shore and Michigan Southern railroads (Map: Pennsylvania, D 4). It is in a productive bituminous coal region and has silk mills, brick and tile works, a tannery, a macaroni factory, and an asbestos plant. Pop., 1900, 3435; 1910, 3189. Reynoldsville was greatly enlarged in 1913, when it annexed West Reynoldsville (pop. 993 in 1910) and three large adjacent areas.

REZNICEK, rĕz-nĭ'chĕk, EMIL NIKOLAUS VON (1861–). An Austrian composer, born at Vienna. He received his musical education from W. A. Remy at Graz and at the Conservatory of Leipzig. After holding various positions as theatre conductor at Graz, Zurich, Stettin, and Jena, he was appointed court conductor at Mannheim in 1896. In 1902 his series of "Orchester-Kammerkonzerte," at which he produced rarely heard works for a small orchestra, attracted favorable attention, and he began a number of successful tours as guest conductor. In 1906 he became a teacher in the Scharwenka Conservatory and in 1909 conductor of the Comic

Opera in Berlin. As a composer he is best known through his operas, of which *Donna Diana* (1894) achieved an unusual success. His other operas are: *Die Jungfrau von Orléans* (1887), *Satanella* (1888), *Emmerich Fortunat* (1889), *Till Eulenspiegel* (1902). He also wrote two symphonies, two symphonic suites, two symphonic poems (*Schlemihl* and *Friede*), a symphony with solo and chorus (*Der Sieger*), a requiem, a mass in F, two string quartets, piano pieces, songs.

RHACHITIS, rȧ-kī′tĭs. See RICKETS.

RHAD′AMAN′THUS (Lat., from Gk. Ῥαδάμανθος). A son of Zeus and Europa and brother of Minos (q.v.). In Homer (*Odyssey*, iv, 564) and the older epic, he is a hero, who by special favor of the gods has been translated, with others, to Elysium (q.v.) or to the Islands of the Blessed (q.v.). In later story these islands become the Kingdom of Cronos and the released Titans, and Rhadamanthus, married to Alcmene, mother of Hercules, holds high rank there and sits as judge. In a still later story Rhadamanthus, with Minos, Æacus, and Triptolemus, because of their justice in this life, sit in judgment on the souls of the dead and assign to them bliss or punishment.

RHADAMES, răd′ȧ-mēz. An oasis and town in north Africa. See GADAMES.

RHÆTIA, rē′shī-ȧ, or, better, **RÆTIA.** A Roman province in the Alps, north of Italy and east of Helvetia, and bounded north by Germany and east by Noricum, thus embracing the Grisons and part of Tirol. It was watered by the Rhine, Athesis (Adige), and Ænus (Inn). The natives, chiefly engaged in herding sheep and cattle, were a hardy and warlike race, but were conquered, together with the Vindelici, about 15 B.C. by the Romans under Tiberius and Drusus. (See Horace, *Odes*, iv, 4 and 14.) Later Vindelicia, to the north, was united with Rhætia. The chief town of Rhætia was Tridentum (Trent); of Vindelicia, Augusta Vindelicorum (Augsburg). Consult M. B. Peaks, *The General Civil and Military Administration of Noricum and Raetia* (Chicago, 1907), and the article "Raetia," in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914).

RHAMNA′CEÆ (Neo-Lat. nom. pl., from Lat. *rhamnos*, from Gk. ῥάμνος, buckthorn, Christ's-thorn), BUCKTHORN FAMILY. A family of about 50 genera and 600 species of dicotyledonous, often spiny trees or shrubs, natives of temperate and tropical countries. They have simple leaves and either fleshy or dry fruit. Some species have been used in dyeing (buckthorn), some in medicine (redroot), and the fruit of some for food. (See JUJUBE.) The chief genera of North America are *Rhamnus* (buckthorn) and *Ceanothus* (New Jersey tea, redroot, etc.).

RHAMNASE, răm′nās. See ENZYME.

RHAM′NUS. A genus of shrubs and trees. See BUCKTHORN.

RHAMNUS PURSHIANA. See CASCARA SAGRADA.

RHAMPHORHYNCHUS, răm′fô-rĭŋ′kŭs (Neo-Lat., from Gk. ῥάμφος, *rhamphos*, curved beak + ῥύγχος, *rhynchos*, snout). A fossil flying reptile of Upper Jurassic age. See PTERODACTYL.

RHAMPHOSUCHUS, răm′fô-sū′kŭs (Neo-Lat., from Gk. ῥάμφος, *rhamphos*, curved beak + σοῦχος, *souchos*, crocodile). One of the largest fossil crocodiles. See CROCODILE.

RHAMPSIN′ITUS (Lat., from Gk. Ῥαμψίνιτος). A king of Egypt, the subject of a remarkable tale concerning a theft from his treasure house, related by Herodotus. Rhampsinitus is to be identified with Rameses III, whose treasury at Medînet Habu is the building referred to in the story of the thief. The accounts of Herodotus are derived from the popular tales and legends which in his time were current in Egypt.

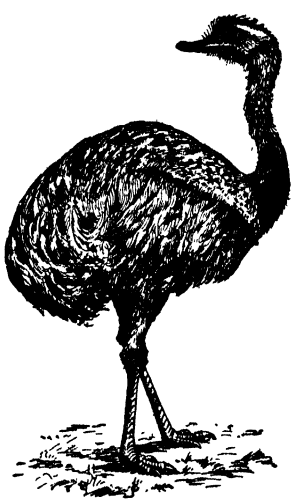
Consult: Herodotus, ii, 121–124; J. G. Wilkinson, *Manners and Customs of the Ancient Egyptians* (London, 1878); G. C. C. Maspero, *Les contes populaires de l'Egypte ancienne* (Paris, 1906); J. H. Breasted, *A History of the Ancient Egyptians* (New York, 1908).

RHANGABÉ, RHANKAVES, or **RHANGAWIS,** răn′gȧ-vēs′. See RANGABE.

RHAP′SODISTS (from Gk. ῥαψῳδός, *rhapsōdos*, bard, from ῥάπτειν, *rhaptein*, to stitch together + ᾠδή, *ōdē*, song, from ἄδειν, *adein*, to sing). In ancient Greece the name of professional reciters of poetry, especially wandering minstrels who recited the Homeric poems. So long as the Homeric lays were handed down orally, the rhapsodists were highly respected; they often exercised a considerable influence upon the text of the poems. But with the circulation of manuscript copies of the poems the character of the rhapsodists gradually changed, so that in the fourth century they are represented as stupid persons, with nothing to commend them but a retentive memory. Their recitations, however, were popular until a comparatively late period. The rhapsodist carried a staff and when reciting wore a crown. He commented upon the poet's meaning and discussed questions of interpretation. Each recitation was known as a rhapsody; hence this term is often applied to the separate books of the *Iliad* and the *Odyssey*. Consult: Plato's *Ion*, 530 B; R. C. Jebb, *Homer* (Boston, 1893); H. Browne, *Homeric Study* (London, 1905); Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. i, part i (6th ed., Munich, 1912). See HOMER.

RHAP′SODY (Lat. *rhapsodia*, from Gk. ῥαψῳδία, recital of poetry, portion of an epic recited at one time, from ῥαψῳδός, *rhapsōdos*, bard). A term in modern music, applied to an instrumental composition written in the form of a fantasia usually upon folk songs or national melodies. The rhapsodies of Lalo and Brahms and the Hungarian rhapsodies of Liszt have become famous.

RHATANY, răt′ȧ-nĭ (Brazil., Portug. *ratanhia*, from Quichua *ratuna*, the native name), or RATTANY, *Krameria triandra* and *Krameria Ixina*. Half-shrubby plants of the family Polygalaceæ, natives of the cold sterile table-lands of the Andes in Peru and Bolivia. Their roots have been used medicinally as an astringent and tonic. When powdered and mixed with orris root or charcoal, the roots are used as a tooth powder. Rhatany root is exported chiefly from Lima, Peru. It is extensively employed in Portugal to color wines, the coloring matter in the roots being known as rhatanic acid.



RHA′ZES. The Latin name of ABU BEKR MOHAMMED IBN ZAKARIYA AL RAZI. The most important of the mediæval Mohammedan physicians. He was born about the middle of the ninth century in the Persian city of Rai. Up to his thirtieth year he devoted himself to music and then took up the study of medicine at Bagdad. He became the head of a hospital at his native place and later at Bagdad. After his reputation was made he traveled, visiting differ-

ent courts. He died either in 923 or 932. Much of Rhazes's knowledge was drawn from Greek sources, but he was more than a mere borrower and is famed as the first to describe smallpox and measles (in his book *Al jardarī wa'l ḥasba*, several times translated into Latin, and into English by Greenhill, London, 1848). He is said to have written more than 200 works; the most famous was the *Kitāb al ṭibb al Mansuri*, a general treatise on medicine in 10 books. The *Kitāb al ḥāwī* (*liber continentis*), a cyclopædia of medicine, was edited from his papers after his death. Both these works were translated into Latin in the fifteenth century, and *al ḥawi* into Hebrew at Brescia in 1486. Consult: Wüstenfeld, *Geschichte der arabischen Aerzte und Naturforscher* (Göttingen, 1840); Leclerc, *Histoire de la médecine arabe* (Paris, 1876); Carl Brockelmann, *Geschichte der arabischen Literatur*, vol. i (Weimar, 1898); C. I. Huart, *Histoire des Arabes* (Paris, 1913).

RHE'A (Lat., from Gk. 'Péa). A Greek goddess representing the productiveness of nature and anciently identified with Cybele (q.v.). She was the daughter of Uranus and Gæa, wife of her brother Cronos, and mother of Zeus, Hades, Poseidon, Hera, Hestia, and Demeter She had an ancient place of worship in Crete, where she gave birth to Zeus on Mount Ida.

RHEA (Lat., from Gk. 'Péa, daughter of Uranus and Gæa). The generic and English name of a family of South American ratite birds allied to the ostrich, from which they differ in having the feet three-toed and each toe armed with a claw; also in being more completely feathered on the head and neck, in having no tail, and in having the wings better developed and plumed and terminated by a hooked spur. The wings are, indeed, more efficient than in any other of the Ratitæ, although unfit for flight.

Rheas are known to Brazilians as ema and to Argentineans as nandu, avestruz, or chueke.

NANDU (*Rhea rothschildi*).

There are two species, of which the best known (*Rhea rothschildi*) is considerably smaller than the ostrich, standing about 3 feet high. It is uniform gray, except on the back, which has a brown tint. The male is larger and darker-colored than the female. The back and rump are furnished with long feathers, much inferior to those of the ostrich in beauty as plumes, but marketable as material for dust brooms and the like. The skins are made up into rugs, of which large numbers are fabricated in the neighborhood of Mendoza, Argentina. The rhea inhabits the great grassy plains of South America, southward of the equator, and abounds on the banks of the La Plata and its more southern tributaries. It is generally seen in small groups, usually associated with guanacos, and eating grass, seeds, berries (especially of *Empetrum*), worms, snails, and almost anything else it can swallow. It runs with great celerity, using its wings in aid. It is polygamous, one male securing possession of two or more females, which lay their eggs together in a mere hollow, where, when 20 or 30 are gathered, they are incubated by the cock.

A smaller and more recently discovered species (*Rhea darwini* or *pennata*) has light-brown plumage, each feather tipped with white. It inhabits Patagonia and extends northward along the base of the Andes to the edge of Peru, and differs from the other in many particulars. A third species has been catalogued, a dark local race, *americana*, in northeastern Brazil, closely related to the ordinary nandu.

Consult Sclater and Hudson, *Argentine Ornithology* (London, 1889), and Charles Darwin, *A Naturalist's Voyage around the World*, in Everyman's Library (New York, 1908). Excellent portraits and descriptions of the three forms may be found in the *Transactions* of the Zoölogical Society of London, vol. iv (London, 1862).

RHEA CYBELE. See CYBELE.

RHEA, or RAMIE, FIBRE. See RAMIE.

RHEA, or REA, SILVIA. A vestal virgin, the daughter of Numitor, and mother of Romulus (q.v.) and Remus, by Mars. When Amulius usurped the throne, the infants were exposed and Rhea Silvia was condemned to be buried alive for breaking the vow of chastity required of the vestals. She was also called Ilia. Consult, e.g., Livy, i, 4.

RHEES, rēs, (BENJAMIN) RUSH (1860–). An American university president and biblical scholar, born in Chicago. He was educated at Amherst College (A.B., 1883), where he was an instructor in mathematics in 1883–85, and at Hartford Theological Seminary, from which he graduated in 1888. After his ordination to the Baptist ministry in 1889, he was pastor of the Middle Street Church at Portsmouth, N. H., for three years. Subsequently he served as associate professor (1892–94) and professor (1894–1900) of New Testament interpretation at the Newton Theological Institution. In 1900 he became president of the University of Rochester, where he held, besides, the chair of biblical literature. In 1915 he was a delegate to the constitutional convention of the State of New York. From Amherst he received the degrees of M.A. (1897) and LL.D. (1900) and from Colgate that of D.D. (1901). His writings include *St. Paul's Experience as a Factor in his Theology* (1896) and *The Life of Jesus of Nazareth: A Study* (1900).

RHEGIUM, rē'jī-ŭm. See REGIUM.

RHEGIUM, PYTHAGORAS OF. See PYTHAGORAS OF RHEGIUM.

RHEGIUS, rē'jī-ŭs (Latinized form of his family name, *Rieger;* the form *Regius*, as if from *König*, king, is incorrect), URBANUS (1489–1541). A Protestant reformer. He was born at Langenargen on Lake Constance, studied

at Freiburg, and at first was professor of rhetoric and poetry at Ingolstadt, and, under the guidance of Eck, the opponent of Luther. Later he turned to theology, entered the priesthood of the Catholic church, and became a doctor of theology at Basel. In 1520 his views underwent a change, and while cathedral preacher at Augsburg he wrote satirical pieces against the church and openly preached Lutheran views. In 1521 he was removed, but in 1524 was again preacher in Augsburg and so remained till the diet held there in 1530. He openly stood for the reform and in 1526 married. When the Emperor had silenced the evangelical preachers of the city, he accepted the invitation of Ernest, Duke of Brunswick-Luneburg, to become pastor at Celle, where he labored until his death. In the eucharistic controversy he wavered, but finally decided for Lutheran views. His Latin works appeared at Nuremberg in 1561, three parts; his German in four parts, in 1562; again at Frankfort, 1577. Of these works the best known are: *Formulæ Caute Loquendi* (1535; in German, 1536; last ed. by Steinmetz, Celle, 1880); *Dialogue von der trostreichen Predigt* (1537), a devotional work much read even in the seventeenth century; *De Restitutione Regni Israelitici* (1536, Ger. trans.). Many of his works were translated into English in the sixteenth century. Consult his *Life* by C. H. Heimburger (Gotha, 1851); by G. Uhlhorn (Elberfeld, 1861); and Steitz, *Die Theologie des Urbanus Regius, speziell sein Verhältnis zu Luther und zu Zwingli, 1521–23* (Gotha, 1898).

RHEIDT, rīt. A town of Prussia. See RHEYDT.

RHEIMS, or **REIMS**, rēmz, *Fr. pron.* rĀNS. The capital of an arrondissement in the Department of Marne, France, situated on the Vesle, 98 miles by rail east-northeast of Paris (Map: France, N., J 3). The city must be described as before the great European War. (See below.) The vineclad Montagne de Rheims and adjacent hills rise on the south and west, and detached forts at various points surround the city. The mediæval ramparts have been replaced by tree-lined boulevards, but some of the ancient gateways have been preserved, of which the most noteworthy is the Porte de Paris. The town is well built, the material used being limestone of the district, which, with the prevalence of the older style of domestic architecture, gives the place a picturesque appearance. There are many quaint old houses. The most striking public building is the thirteenth-century cathedral, which, although it never had the towers of the original design, was one of the finest specimens of Gothic architecture. It is 453 feet long. The elaborate west façade, flanked by two towers, had 500 statues and a splendid rose window. Scarcely less beautiful was the north portal, with its sculptures. The cathedral is famous as the church in which the French kings were crowned. The eleventh-century Romanesque abbey church of St. Remy is of nearly equal size. Other interesting buildings are the hospital occupying the ancient abbey of St. Remy, the fifteenth-century archiepiscopal palace with a museum of sculpture, and a handsome hôtel de ville, begun in 1627, containing the public museum and library of over 100,000 volumes. The Porta Martis, a Roman relic, is a fine triple triumphal arch of the fourth century in a fair state of preservation. The chief modern educational institutions are the lyceum and a preparatory school of medicine and pharmacy. Rheims is one of the principal entrepôts for the wines of Champagne. It is a great centre of woolen manufactures.

Rheims is built on the site of Durocortorum, or Civitas Remorum, the capital of the Remi. On the Montagne de Rheims, south of the city, are a number of Gallo-Roman remains. Under the Frank rule Rheims was a place of much importance, and it acquired a religious interest from its having been the scene of the baptism of Clovis and his chief officers by the Bishop, St. Remy, in 496. In the eighth century it became the seat of an archbishopric, and from 1179, in which year Philip Augustus was solemnly crowned there, it was the place for the coronation of the kings of France down to the time of Charles X. The town suffered severely during the campaign of 1814 and on Sept. 4, 1870, was occupied by the Germans. In the European War which began in 1914 Rheims again suffered severely. It was bombarded time and again by the Germans and was a target for numerous aërial attacks. The cathedral was damaged to an irreparable extent. (See WAR IN EUROPE.) Pop. (commune), 1901, 108,385; 1911, 115,178. Consult: Guillaume Marlot, *Histoire de la ville, cité et université de Reims* (3 vols., Rheims, 1843–45); J. Justinus (Baron Taylor), *Reims, la ville des sacres* (Paris, 1860); Alphonse Gosset, *Cathédrale de Reims* (ib., 1895); Soissons, "Reims and its Cathedral," in *Contemporary Review*, vol. cvi (New York, 1914).

RHEINBERGER, rīn'bĕrK-ĕr, JOSEPH (1839–1901). A German organist and composer, born in Vaduz, Liechtenstein. He received the greater part of his musical education at the Royal School of Music, Munich, where he subsequently taught the organ, counterpoint, and composition. He was organist of St. Michael, conductor of the Oratorio Society, repetitor at the Court Opera, and court kapellmeister, and he was regarded as one of the greatest theory and organ teachers of his time. He died in Munich. His music is scholarly and refined, but lacking in inspiration. His compositions include: *Christophorus*, oratorio; *Toggenburg* and *Waldmorgen*, cantatas; *Konig Erich*, ballad for chorus with pianoforte; *Wittekind* and *Das Thal des Espingo*, chorus; the *Wallenstein* and *Florentine* symphonies; overtures, pianoforte, chamber, organ, and orchestral music; and the operas *Die sieben Raben* (1869) and *Türmers Tochterlein* (1873).

RHEINE, rī'ne. A town in the Province of Westphalia, Prussia, on the Ems, at the head of navigation, 24 miles by rail north-northwest of Münster (Map: Germany, B 2). It is known principally for its manufactures of cotton, jute, linen, tobacco, and machinery. Pop., 1900, 10,371; 1910, 14,403.

RHEINFELS, rīn'fĕls. The largest and one of the most beautiful of the ruined castles on the Rhine. It was built in 1245 by the Count of Katzenelnbogen, one of the petty barons of the Rhine. In 1794 the French gained possession of it and blew it up in 1797.

RHEINGOLD, rīn'gōlt, DAS. The first division of Richard Wagner's music drama *Der Ring des Nibelungen*. It was first given in Munich, Sept. 22, 1869; in the United States, Jan. 4, 1889 (New York). See RING OF THE NIBELUNGEN.

RHENANUS, rā-nā'nus, BEATUS (1485–1547). A German classical scholar, whose real name was Bild von Rheinau. He was born at

Schlettstadt, Alsace, and, after studying at the University of Paris, spent most of his life in his native city. He was an intimate friend of Erasmus and wrote his biography. His works, which show great critical acumen, include editions of Pliny's *Epistolæ* (1514), Tacitus (1519), Tertullian (1521), and Livius (with Gelenius, 1535), the *editio princeps* of *Velleius Paterculus* (1522), from a manuscript which he had himself discovered at Murbach; and an historical work, *Rerum Germanicarum Libri Tres* (1531), which was considered the finest piece of historical research of his day. He was the first to question the authenticity of the *Dialogus* of Tacitus. Consult: Horawitz, *Beatus Rhenanus* (Vienna, 1872); *Des Beatus Rhenanus litterarische Thatigkeit* (ib., 1872); *Die Bibliothek und Korrespondenz des Beatus Rhenanus* (ib., 1874); Knod, *Aus der Bibliothek des Beatus Rhenanus* (Leipzig, 1889); J. E. Sandys, *A History of Classical Scholarship*, vol. ii (Cambridge, 1908).

RHEN'ISH ARCHITECTURE. See ROMANESQUE ART, *Germany*

RHENISH CONFEDERATION. See CONFEDERATION OF THE RHINE.

RHENISH PRUSSIA. A province of Prussia. See RHINE PROVINCE

RHENSE. See RENSE.

RHEOTROPISM, rē-ōt'rō-pĭz'm (from Gk. *ῥεῖν, rhein,* to flow + *τροπή, tropē,* turn) The imperfectly understood sensitiveness which enables plant organs, especially roots, to bend their tips either towards or away from the source of a current of water in which they are placed. Negative rheotropic curvatures are often merely gross mechanical effects of the force of the stream. But positive curvatives (i.e., towards the source) are undoubtedly due to a specific reaction on the part of the organ. Positive rheotropism of roots is exhibited well by seedlings of the radish, maize, and *Vicia sativa.* The response is apparently caused by the pressure of the flowing water, and, unlike other tropisms, the perceptive zone is not limited to the very tip, but extends back at least 15 millimeters. See TROPISM.

RHE'SUS (Lat., from Gk. *Ῥῆσος*). 1. A Bithynian river god, son of Oceanus and Tethys 2. A Thracian ally of the Trojans, of whom the oracle declared that, if his white horses should drink the waters of the Xanthus or feed on the grass of the plain of Troy, the city would not be taken. As soon as Rhesus reached the Trojan territory, he was surprised and slain in his camp by Odysseus and Diomedes, and his horses were carried off. Consult *Iliad,* x, 434 ff., and Vergil, *Æneid,* i, 469–473.

RHESUS (from Lat. *Rhesus,* Gk. *Ῥῆσος,* name of a river in the Troad, another in Bithynia, a king of Thrace, etc.). A small brown monkey (*Macacus,* or *Pithecus, rhesus*), common all over India. It is known as the Bengal monkey, or bandar of the Hindus. It moves about in large bands, ascending to the height of 8500 feet in the Himalaya, and is often protected and fed in the neighborhood of temples by the Hindu priests, although not universally regarded as sacred. This monkey is one of those most familiar in menageries, where it may be recognized by the straightness of its moderately long hair, by the tapering tail, about one-half the length of the head and body, and by the nakedness of the buttocks for some distance around the callosities. Cf. MACAQUE.

RHET'ORIC (OF. *rhetorique,* Lat. *rhetorica,* from Gk. *ῥητορική, rhētorikē,* rhetorical art, from *ῥήτωρ, rhētōr,* orator). Taken broadly, the science and art of communication in language. The tendency of modern textbooks, however, has been to broaden the scope of rhetoric to include everything pertaining to the art of composition.

Regarded from the scientific point of view, rhetoric properly belongs to that branch of knowledge which is concerned with the relations of men in society. In every community a great variety of activities go on simultaneously. One important group of these activities consists of all the processes by which men express themselves and convey their thoughts and feelings to their fellows. It includes not only the more primitive modes of thought conveyance, such as gesture, picture writing, and the like, but also the most highly elaborated modes, such as the arts of architecture, sculpture, music, painting, and oral and written speech. This large class may be subdivided in two ways: (1) according to the medium employed in the process of thought conveyance, and (2) accordingly as the emphasis is thrown upon the individual or the social phase of the process. The first method of classification leads to the differentiation of the several arts; the second to the distinction of processes mainly self-expressive from processes mainly communicative. The subject matter of rhetoric is thus seen to be distinguished from that of allied sciences by the fact (1) that its medium is language and (2) that the emphasis is thrown upon the phase of communication, i.e., upon prose. But although rhetoric is primarily the science of communication, it is still concerned to a large extent with questions of expression.

It is obvious, therefore, that the underlying problem of rhetoric concerns the reciprocal speech relations of the individual and the community. Of this problem there are three principal phases, as follows:

I. *Psychological problems* relating (1) to the nature of the writing or speaking man, (2) to the mental activities involved in the process of composing. Here arise questions regarding (*a*) the nature and genesis of expression, (*b*) the characteristics of genius, (*c*) the acquirement and cultivation of the speech habit, and (*d*) the factors operating in the experience of the individual to turn his self-expression into the communicative channel. The first of these questions was treated at some length by Darwin (q.v.) in his *Expression of the Emotions,* and by his opponents; the second, by Lombroso (q.v.) and others; and the third, by many recent psychologists. The fourth is as yet practically unexplored. It is obvious, however, to touch upon it briefly, that every successful writer or speaker is on one side receptive, on the other productive. As receptive he is a product of heredity and of the social environment, while as productive he exhibits the faculties of invention and social imagination.

II. *Social problems,* relating to the dynamic effect of speech upon the community of hearers or readers. The assumption which underlies discussion of the subject from this point of view is that language is preëminently the social bond. The main questions relate (1) to the typical modes of response on the part of individuals and groups of individuals in the community, (2) to the formation of social or public opin-

ion. Diall (*Psychology of the Aggregate Mind of an Audience*, Terre Haute, 1897) has endeavored to show that the minds of an assemblage listening to a powerful speaker undergo a curious process called fusion, by which the auditors are reduced as it were to a single individual, whose characteristics are those of an impulsive youth. But it is important here to distinguish, as Tarde has done (*L'Opinion et la foule*, Paris, 1901), between a "crowd" and a "public," the associative principle of the former being physical, of the latter psychical.

III. *Formal problems*, relating to the medium of communication, viz., language, or, more precisely, discourse, i.e., language in organized form. The main problems concern: (1) the nature and origin of discourse; (2) the peculiar function of discourse, as (*a*) on one side the expression of the individual and (*b*) on the other the means of social interchange; (3) the structure or morphology of discourse in (*a*) its minuter forms (words, sentences, paragraphs, etc.), (*b*) its larger forms (whole compositions), (*c*) its typical modes (description, narration, exposition, etc.); and (4) the typical methods of distribution (books, newspapers, etc.). The formal aspect of rhetoric has been developed in considerable detail in ancient and modern treatises, but has not been consistently unified or properly connected with the other two phases. Of all the principles that have been advanced to explain the structural side of rhetoric, that of organic unity is perhaps most fundamental, and from it may be derived all of the usual rhetorical qualities. But the truth is that all such principles are derivative, not primary. A truly scientific exposition would demonstrate that the peculiar forms and qualities of any piece of discourse are the natural outcome of the interaction of the individual and society in the process of communication. An oration, e.g., is the product of two forces, (1) the impulse of the individual to a certain kind of self-expression, and (2) the demand of the social mind for a certain kind of communication. The oration is the meeting point of these two forces.

History. The art of rhetoric seems to have been founded by Corax of Syracuse (c.466 B.C.) and further developed by his pupil Tisias (q.v.). The Sicilian, Gorgias (q.v.) of Leontini, introduced the new method into Athens during his ambassadorship in 427 B.C. It was the Athenian orator Antiphon (q.v.), however, who first combined the theory with the practice of rhetoric. The great publicist Isocrates (q.v.) founded a school of rhetoric, which he called the "art of persuasion," that was famous from 390 B.C. until his death. The rhetoric of Aristotle (q.v.), composed about 322 B.C., contains contributions of the greatest value. The system of scholastic rhetoric which finally became established was formulated principally by the practical rhetorician Hermagoras (q.v.), who wrote about 110 B.C. His system was founded directly upon that of the Stoic philosophers. The most important representatives of his school were Hermogenes (q.v.) among the Greeks and Quintilian (q.v.) among the Latins. The former, who flourished about 170 A.D., composed, besides a *Manual*, a complete digest of the subject from the time of his master Hermagoras. Other names of importance in the later history of Greek rhetoric are Longinus (q.v.), who wrote an *Art of Rhetoric* about 260 A.D., the eminent sophist Dio Chrysostomus (q.v.), Dionysius of Halicarnassus (q.v.), Himerius (q.v.), and Aphthonius, who composed in the latter half of the fourth century exercises that were destined to supersede those of Hermogenes. (See GREEK LITERATURE.) With the advent of the Renaissance numerous rhetorics were composed based principally upon the *De Institutione Oratoria* of Quintilian. In English Leonard Cox wrote before 1549 an *Art or Craft of Rhetoryke*, which was soon followed by the *Art of Rhetorique* of Thomas Wilson (1553). In French the treatises of Tonquelin (1555) and Courcelles (1557) attained much popularity.

RHETORIC, FIGURES OF. A term popularly applied to a large and heterogeneous class of language forms, all characterized by the fact that they are deviations from what is plain, literal, and straightforward From ancient times figures have been regarded by rhetoricians as embellishments of speech, i.e., as conscious devices and ornaments. Figures are commonly said to give strength and beauty to style, but it would perhaps be truer to say that they have the power of arousing in the reader or hearer the same emotional and imaginative processes which gave birth to them in the mind of the writer.

Since the conceivable modes of departure from literal statement are almost infinite in number, it is obvious that an exhaustive enumeration of figures is difficult and a classification of them well-nigh impossible. The ancients, for whom the subject had a peculiar fascination, enumerated as many as 250 distinct species, and although modern writers, generally speaking, have been less prodigal in their invention, the *Arte of Poesie*, attributed to Puttenham (1589), names and defines 107. In recent textbooks the tendency is to limit the number to 10 or 12. The important figures are as follows:

I. **Figures of Imagery.** These are figures which arouse concrete images in the mind of the hearer. They are: (*a*) *Metaphor* (q.v.). Akin to metaphor, though distinct as being a legitimate development of semasiology (q.v.), is catachresis, in which a word is extended in meaning beyond its strict sense, as "a silver

drinking horn." (b) *Allegory* (q.v.). (c) *Simile* differs from metaphor in that the resemblance between object and image which is assumed in metaphor is in the simile expressly stated by means of the word "like" or "as." Thus, "His face was a withered moon" is metaphor, but "All his face was white And colorless, and like the wither'd moon, Smote by the fresh beam of the springing east," is simile. (d) *Synecdoche* is a kind of metaphor in which the image is related to the object as a part to the whole, as the whole to a part, as genus to species, etc. Thus, in "All hands on deck," "hands" is used for "men." (e) *Metonymy* (q.v.) and synecdoche are so nearly alike that distinction between them is hardly worth preserving.

II. **Figures of Arrangement.** In these figures words, phrases, clauses, or sentences are disposed in some peculiar and striking way to correspond to peculiar sequences of thought. (a) *Climax* consists in the arrangement of words, clauses, or sentences in the order of their importance, the least forcible coming first and the others rising in importance until the last; as in this example: "It is an outrage to bind a Roman citizen; it is a crime to scourge him; it is almost parricide to kill him; but to crucify him—what shall I say of this?" (b) *Antithesis* occurs when corresponding parts of a sentence are so juxtaposed as to give force to contrasting ideas; as, "To err is human, to forgive divine." Both climax and antithesis may appear also in the arrangement of the larger units of composition, as paragraphs and complete essays, as well as in the smaller units of words, clauses, and sentences.

III. **Figures of Contradiction.** In these figures there is an apparent contradiction between the form of expression and the idea to be expressed. They are: (a) *irony* (q.v.); (b) *epigram* (q.v.); and (c) *hyperbole* (q.v.). Hyperbole may also be looked upon as a kind of metaphor. Of the figures defined or named above, four—metaphor, metonymy, synecdoche, and irony—are often called tropes, because in them a word is turned from its ordinary meaning or application. But the word is also applied to a figure of any kind expressed in a single word.

Among the figures which are less easy to classify may be mentioned the following: *Antiphrasis* (q.v.). *Apophasis, paraleipsis*, or *omission* is the pretended omission or passing over of what one is really mentioning. *Apostrophe* is a turning aside to address an inanimate object or a person not present. *Asyndeton* consists in the omission of connectives, as, "I came, I saw, I conquered." *Epanorthosis* is an effective correction of something which has just been said, as, "His fault—perhaps I should rather say his crime." *Epiplexis* is a figure in which a person seeks to move or persuade by means of gentle upbraiding. *Epiploce* is a climax consisting of several clauses so framed that the last part of one clause is repeated as the beginning of the next, as, "He not only spared his enemies, but continued them in employment; not only continued them, but even advanced them." *Epistrophe* is a figure by which successive clauses or sentences end with the same emphatic word or phrase, as, "Are they Hebrews? So am I. Are they Israelites? So am I. Are they the seed of Abraham? So am I." *Euphemism* (q.v.). *Interrogation* is the asking of questions, not to gain information, but to assert more emphatically the opposite of what is asked. *Litotes*, see ANTIPHRASIS. *Onomatopœia* (q.v.). *Personification* or *prosopopœia* is the representation of inanimate objects as living beings, as, "Necessity is the mother of invention." See ANACOLUTHON.

RHETT, rĕt, ROBERT BARNWELL (1800–76). An American politician, born at Beaufort, S. C. His name was originally Smith, but after entering public life he changed it for that of a prominent Colonial ancestor. He studied law and in 1826 became a member of the State Legislature. In 1832 he was elected Attorney-General of the State, and during the nullification agitation attracted wide attention by his radical advocacy of the theory of State rights, in which he outstripped Calhoun himself. In the fall of 1836 he was elected as a Democrat to Congress, sitting by reëlection until 1849 and taking a leading part in the acrimonious slavery debates. In 1850 he was elected United States Senator to fill the vacancy caused by the death of John C. Calhoun. He stoutly opposed all compromises on the question of slavery. In the heated campaign of the year 1852 he advocated the immediate withdrawal of South Carolina from the Union without consultation with other Southern States. The Union candidates were generally successful at the ensuing election. Rhett took the defeat as a personal rebuke, resigned his seat in the Senate, and retired to his plantation. In the Charleston *Mercury*, in which he purchased a controlling interest, he continued to advocate his extreme views, and in 1860 again came into prominence as one of the most radical members of the South Carolina convention which adopted the ordinance of secession, and was the author of its address to the people. In the Montgomery convention which met to organize a provisional government for the seceding States he was one of the most active delegates, and was chairman of the committee which reported the Confederate constitution. Subsequently he was elected a member of the Lower House of the Confederate Congress. After the war he settled in Louisiana. He was a delegate to the Democratic National Convention in 1868.

RHEU'MATISM (Lat. *rheumatismus*, from Gk. ῥευματισμός, liability to rheum, a flux, from ῥευματίζεσθαι, *rheumatizesthai*, to have a flux, from ῥεῦμα, *rheuma*, flux, flow, from ῥεῖν, *rhein*, Skt. *sru*, to flow). An acute or chronic disease characterized by painful local inflammations. It may be divided for convenience of description into the articular (that involving the joints) and the muscular varieties. Either form may be acute or chronic. Acute articular rheumatism is a constitutional disease, not contagious, and characterized by fever, pain, and inflammation in and around the joints and a tendency to involvement of the pericardium and endocardium. The joints are apt to be attacked in succession. Rheumatism is a disease of moist and temperate climates, and the acute articular form usually occurs in young adults, although children are not by any means exempt.

The close analogy that exists between acute rheumatism and certain of the infectious diseases has led many investigators to believe that it is due to a specific germ, in spite of the fact that no microörganism has as yet been found constantly associated with the disease. A more generally accepted theory is that it is due to some toxic material produced in the system as

a result of defective metabolism, tonsillar inflammation, or certain bacilli, such as streptococcus and staphylococcus. The immediate exciting causes are exposure to wet and cold or a sudden chilling of the body. The symptoms begin suddenly, with pain and stiffness in the joints, followed by high fever and profuse acid sweats, the urine becoming high-colored, scanty, and abnormally acid. The affected joints are painful and tender, hot, red, and swollen. Swelling is apt to be most apparent in joints scantily covered with muscle, viz., the knee, wrist, elbow, ankle, and the joints of the hands and feet. One or more joints may be affected, and the disease travels from joint to joint. Acute rheumatism is distinguished by the number and severity of its complications. These affect principally the serous membranes of the body. Pericarditis (q.v.) is a common complication. Endocarditis (q.v.), which may become chronic, is also of frequent occurrence. Pleurisy (q.v.) with effusion is often seen in association with pericarditis. Less often bronchitis, pneumonia, and inflammation of the cerebral arteries occur. In itself acute articular rheumatism is not a fatal disease, and the majority of cases recover within a week or 10 days. Relapses, however, often occur, and weeks or months may pass before entire cure is attained.

Chronic articular rheumatism may result from an acute attack, but most frequently it arises independently in persons of advanced middle age. The causative elements are similar to those of the acute form, but the onset is insidious. It is most apt to attack those whose occupation exposes them to cold and damp. The joints gradually become painful and stiff, but the symptoms vary in severity from time to time; they are worse in the morning and are aggravated by damp weather. Late in the disease the joints become greatly distorted and almost immovable.

Muscular rheumatism is an affection of the voluntary muscles and of the fasciæ and periosteum to which they are attached. It is inflammatory in character and may be acute or chronic. In contrast to the articular variety, muscular rheumatism is never complicated by cardiac disease. It is a malady of adult life, is almost always due to cold and damp, and one attack predisposes to another. The first attack is generally acute. The onset is sudden, with pain in the affected muscles, with slight tenderness, and considerable stiffness and difficulty of movement, by which the pain is increased. Fever is absent or slight. The acute attack lasts about a week. When the disease reaches the chronic stage the attacks return frequently and finally become constant and aggravated when the weather is damp. This form of rheumatism is prone to involve particular groups of muscles, and different names have been applied to it according to its location. *Torticollis* (wryneck) is an affection of the muscles of the side of the neck, usually rheumatic. It is generally limited to one side, towards which the head is twisted. Another form is *lumbago* (q.v.).

For the treatment of acute rheumatism rest in bed is imperative. Local measures to relieve pain consist in wrapping the affected joints in cotton wool, upon which some anodyne liniment, such as belladonna or opium or oil of wintergreen, may be sprinkled freely. The drugs now used internally consist of salicylic acid and its derivatives, with acetanilide, antipyrine, or morphine to relieve severe pain. It is agreed, however, among the best authorities that no medicine has much control over the course or duration of the disease. The diet should consist of milk chiefly, either alone or diluted with barley water, lime water, or vichy. Lemonade is beneficial as a drink. In acute muscular rheumatism hot poultices applied to the parts affected will afford great relief. The modern view is that chronic arthritis is due largely to the absorption of toxins from small foci in the teeth, tonsils, or intestinal tract, e.g., the appendix. Drainage, or removal of pus foci, has certainly worked remarkable cures. When the focus is not discoverable an examination of the blood will often reveal, by the reaction of the serum to certain tests, the identity of the exciting organism. From this a vaccine is prepared which assists materially in the cure. Chronic rheumatism is best treated locally by friction with stimulating liniments. Relief is obtained both from pain and loss of function by exposure of the joints to superheated air in a specially devised apparatus. (See HOT-AIR TREATMENT.) Electricity and hydrotherapy (q.v.) are useful in improving the circulation and nutrition of the joints. The static wave current, high-frequency electric currents, and vibratory massage are also used. Internally the most used drug is potassium iodide. The alkaline waters may be taken Attention must be paid to the general health, and good food, warm clothing, and tonics, particularly cod-liver oil, iron, arsenic, and strychnine, are necessary to prevent relapses and recruit the strength.

RHEYDT, rīt, or **RHEIDT.** A town in the Rhine Province, Prussia, on the Niers, 28 miles northwest of Cologne (Map: Prussia, B 3). It has a handsome new town hall, statues of William I and of Bismarck, and a fine Hohenzollern fountain in the market place. It manufactures silks, woolens, velvets, machinery, cigars, paper, etc., and has dye works. Rheydt received municipal privileges in 1856. Pop. (commune), 1900, 34,034; 1910, 43,786.

RHIGAS, KONSTANTINOS. See RIGAS, KONSTANTINOS.

RHIGOLENE, rīg'ō-lēn. See PETROLEUM.

RHIN, răn, BAS- (Fr., Lower Rhine). A former frontier department of France, corresponding nearly to the present German administrative District of Lower Alsace in the Imperial territory of Alsace-Lorraine (q.v.). It was ceded to Germany in 1871 by the Treaty of Frankfort.

RHIN, HAUT- (Fr., Upper Rhine). A former frontier department in the east of France, with the exception of the Territory of Belfort (q.v.), since 1871 comprehended within the German District of Upper Alsace. The Territory of Belfort is often called Haut-Rhine. See ALSACE-LORRAINE.

RHIND PAPYRUS. See EGYPT, *Literature and Science.*

RHINE. The principal river of western Europe. It rises in southern Switzerland and flows in a general northwest direction through western Germany and Holland, emptying into the North Sea after a course of over 800 miles (Map: Germany, B 3). The Rhine proper is formed in the Canton of Grisons, eastern Switzerland, by two main head streams, the Vorderrhein and the Hinterrhein. The former,

the larger of the two, rises on the north slope of the St. Gotthard group within 2 miles of the source of the Rhone, at an altitude of 7690 feet, and passes northeast along the base of the Glarner Alps till it meets the Hinterrhein coming from the south from the glaciers of the Rheinwaldhorn. The combined stream, swelled by numerous mountain torrents to a width of 45 yards, flows northward, separating Switzerland from Liechtenstein and Austria, and enters the Lake of Constance. It leaves the main body of the lake at the town of Constance and passes into the Unter See (Lower Lake) a short distance farther on. The Rhine now flows westward, becomes narrow and very rapid, finally (below Schaffhausen) plunging over a rocky precipice 70 feet high. Another and smaller fall is encountered at Zurzach, below which the Rhine receives its first great tributary, the Aar, which brings to it the waters of northwestern Switzerland. The river bed continues for some distance to be narrow and rocky, with several rapids. It continues its westward course to Basel, where it makes a sharp turn to the north and enters wholly into German territory, having formed the boundary between Germany and Switzerland from the Falls of Schaffhausen to this point. At Basel the river is 190 yards wide and is henceforth navigable without obstructions It now flows on the boundary between Baden and Alsace through a wide and level flood plain in the great rift valley formed by the sinking of a great block between two high-lying blocks, the Vosges on the west and the Black Forest on the east. In this valley it passes Strassburg, Mannheim, Worms, and Mainz, and receives the Ill, the Neckar, and the Main. At Mainz the river makes a short turn to the west, and then at Bingen an abrupt turn to the northwest. It now enters upon the most romantic and celebrated part of its course, reaching from Bingen to Bonn, a distance of about 80 miles, all through Prussian territory. Of late years, however, the beauty of the stretch between Coblenz and Bonn has been marred by quarries, cement factories, etc. Here the river is much narrowed and winds between steep mountains rising often from the water's edge. The heights are crowned by the famous ruined castles and the slopes are covered with vineyards, this stretch being well known for the Rhenish wines. The chief town on the Rhine in this part of the course is Coblenz, at the confluence of the Moselle, the largest tributary from the left. After passing the Siebengebirge at Bonn the river and its valley again widen out, and from Cologne to its mouth the Rhine flows through a low, level country, turning gradually westward as it enters Holland. The largest city on its banks below Cologne is Düsseldorf. A short distance below Düsseldorf the Rhine is joined by the Ruhr from the right, and a little farther down it receives the Lippe, also from the right. Shortly after passing the Dutch boundary it divides into two arms, the southern and larger of which, known as the Waal, flows into the great delta of southern Holland, where it merges with the Meuse and the Scheldt. The northern arm divides again at Arnhem, the Yssel coursing north into the Zuider Zee, and the other arm flowing westward, parallel with the Waal. This latter arm, called Lek (Leck) below Wijk, pours its waters into the North Sea through the Nieuwe (New) Maas. At Wijk a narrow arm, which at first bears the name of the Crooked Rhine, branches out northward and flows past Utrecht, below which it is known as the Old Rhine. At Utrecht the Vecht branches out from this arm and flows into the Zuider Zee. The Old Rhine, which has barely the dimensions of a river, flows past Leyden and discharges into the North Sea a few miles north of Scheveningen.

Commercially the Rhine is probably the most important river of Europe, its valley being densely populated, with numerous important industrial cities, especially along its middle course and its large tributaries. Canals connect the Rhine with the Meuse, the Seine, the Saône, the Danube, and the Ems. The Rhine-Rhone Canal follows the course of the river from Strassburg almost to Basel, and is generally used instead of the river, whose current here is very swift. The shipping at the principal ports amounts to nearly 17,000,000 tons annually. The river is visited every year by from 1,000,000 to 2,000,000 tourists. The legends of the Rhine figure prominently in German folk literature.

M. Mansfield, *Cathedrals and Churches of the Rhine* (Boston, 1906), H. J. Mackinder, *The Rhine* (New York, 1908); E. J. Clapp, *The Navigable Rhine* (ib., 1911).

RHINE, Confederation of the. See Confederation of the Rhine.

RHINE-HESSE. A province of the Grand Duchy of Hesse (q.v.), Germany.

RHINE'LANDER. A city and the county seat of Oneida Co., Wis., 103 miles northwest of Green Bay, on the Wisconsin River, at the Pelican Rapids, which afford abundant water power, and on the Chicago and Northwestern and the Minneapolis, St. Paul, and Sault Ste. Marie railroads (Map: Wisconsin, D 3). It is the centre of a busy lumber district and has saw and planing mills, large paper and pulp mills, a refrigerator factory, a veneer factory, boiler and iron works, etc. Pop., 1900, 4998; 1910, 5637.

RHINE PROVINCE (Ger. *Rheinprovinz*, or *Rheinland*), or Rhenish Prussia. The most densely populated province of Prussia, bounded by the Netherlands on the north, Westphalia and Hesse-Nassau on the east, Lorraine and the Palatinate on the south, and Luxemburg, Belgium, and the Netherlands on the west (Map: Germany, B 3). It covers an area of 10,425 square miles. About 43 per cent of the total area is under tillage. The chief agricultural products are rye, wheat, barley, oats, and potatoes. There are extensive vineyards along the Rhine and Moselle, and wine is exported on a large scale. The large coal fields to which the province mainly owes its industrial development are situated chiefly along the Ruhr and the Saar. The province produces annually upward of 25,000,000 tons. Iron, zinc, lead, copper, quicksilver, and manganese are mined. Salt, sulphur, and several kinds of stone and useful earth are also produced in considerable quantities. The production of different metal articles from locomotives and guns to needles and small tools ranks first among the manufacturing industries of the province. The textile

branches have also attained a high state of development. Some of the textiles, such as the woolen fabrics of Aix-la-Chapelle or the silks of Krefeld, are foremost in the world. The Rhine Province has also extensive glass works, paper mills, chemical works, and tanneries, besides a number of sugar refineries, distilleries, and breweries.

The extensive trade of the province is greatly promoted by the excellent transportation facilities, especially the railways. There are over 2900 miles of railway. The chief commercial centres of the province are Cologne, Düsseldorf, Aix-la-Chapelle, Coblenz, and Duisburg. It is divided into the five government districts of Coblenz, Düsseldorf, Cologne, Treves, and Aix-la-Chapelle. The capital is Coblenz. The province is represented in the Prussian Landtag by 28 members in the upper and 62 delegates in the lower chamber. It returns 35 members to the German Reichstag. The population of the Rhine Province more than trebled during the nineteenth century. In 1816 it was 1,910,000; in 1900 it was 5,759,798; in 1910, 7,121,140. Nearly 70 per cent is Roman Catholic.

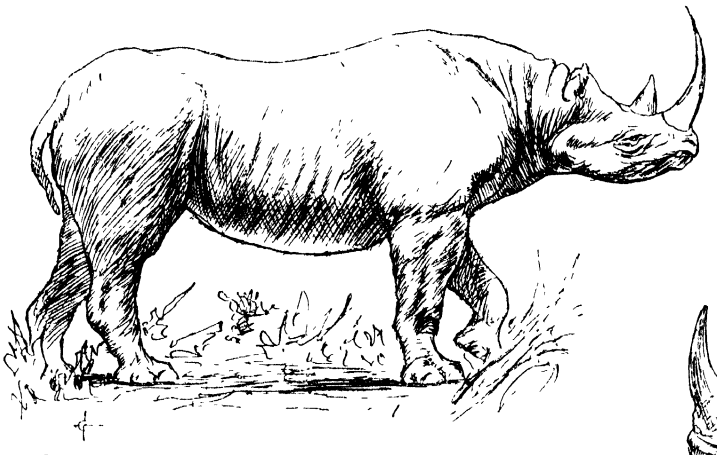
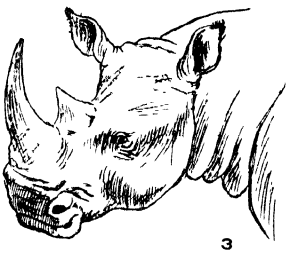
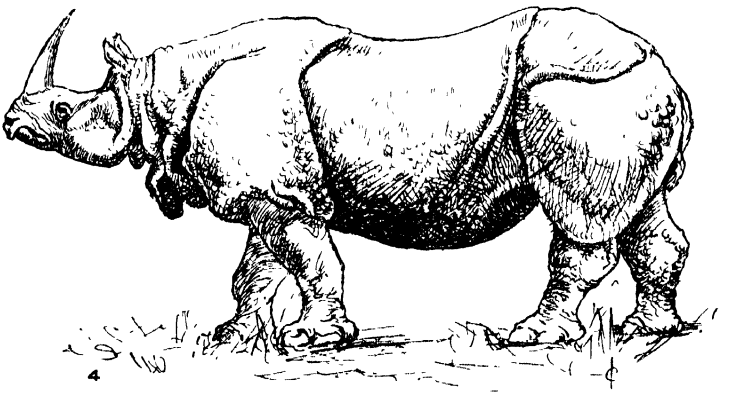
RHINI'TIS (Neo-Lat., from Gk. *ῥίς, rhis*, nose). Inflammatory disease of the mucous membrane of the nose; nasal catarrh. Low temperature, drafts, or mechanical irritants, together with certain bacilli combine to cause a hyperæmic swelling, with first a dryness, then an increased production of mucus and a transudation of serum into the blood vessels. Emigration of leucocytes may follow (see INFLAMMATION), and desquamation of epithelium from the mucous membrane may occur. The acute form of the disease is commonly known as "cold in the head." Many cases are due to contagion. The mucous membrane may remain thickened permanently, constituting what is known as hypertrophic rhinitis, or may become atrophic, so that an ordinary attack of rhinitis may terminate in three or four days or may pass into a chronic condition, continuing for months. This chronic form, however, is usually kept up by a coexistent inflammation of some of the accessory nasal sinuses. Some cases are caused by reflex irritation, the primary seat of trouble being in overstimulated sexual organs. In the treatment of acute rhinitis preparations of ammonium, belladonna, potassium citrate, ipecacuanha, camphor, carbolic acid, and saline cathartics are used, as well as alkaline or astringent topical applications. Similar treatment is used in cases of chronic rhinitis, besides surgical interference in the way of removal of hypertrophic tissue, both mucous membrane and bone, as well as the correction of intranasal deformities. Hay fever is sometimes classed as a rhinitis and is discussed under its own title. *Rhinitis ulcerosa* is considered under OZENA. Rhinitis is a symptom of measles, and sometimes complicates other infectious diseases, e.g., scarlet fever and diphtheria; and intestinal autointoxication is often a factor in the repeated attacks which some persons suffer.



RHINOCEROS, rī-nŏs'ĕr-os (Lat. *rhinoceros*, from Gk. *ῥινόκερως, rhinokerōs*, rhinoceros, nose-horned, from *ῥίς, rhis*, nose + *κέρας, keras*, horn). An animal of a family of perissodactyl ungulates (q.v.), the Rhinocerotidæ, closely allied to the tapirs, and containing the largest and most powerful of terrestrial mammals, except the elephants. There are five existing species, all natives of the warm parts of Asia, the Indian Archipelago, and Africa. The form of the rhinoceros is massive and uncouth. The limbs are thick and strong; each foot is terminated by three nearly equal toes, covered with broad hoof-like nails, with a fourth nonfunctional toe on the front feet. The tail is small and terminated by a small tuft. The head is large, the muzzle prolonged, ears moderately large, eyes small, and nasal bones combined into an arch for the support of a horn or horns. The upper lip in most species is prolonged, pointed, and prehensile. The incisors are defective in the Asiatic species and, as well as the canines, wanting altogether in the African species; the molars and premolars are alike and highly effective as grinders. The skin is extremely thick and smooth, but soft and sensitive, although in the Asiatic species it has the appearance of a rigid armor, studded with tubercles and jointed in folds or wrinkles where necessary to permit movement of the head and limbs. The hide is used for making whips, harness, ropes, and so on, and when dried and hardened forms a material for shields capable of resisting spear thrusts and old-fashioned bullets. When properly dried and prepared it has the translucency and mottled appearance of tortoise shell, and from it are made various ornamental objects by East Indian artificers. The nasal horn or horns are formed of a solid mass of agglutinated bristles which spring from the skin of the nose, but are rooted upon a bony plate surmounting the skeleton of the nose. This horn is not only a powerful weapon, but with it the animal can root up and overturn bushes and small trees whose leaves and roots it seeks to eat.



The Indian rhinoceros (*Rhinoceros indicus*) formerly ranged over most of the peninsula, but is now restricted almost entirely to the Assam plain and lives chiefly in grassy jungles. It is the largest known species and sometimes exceeds 5 feet in height and 10 feet in length. The single horn is sometimes 2 feet long and 18 inches in circumference at the base. The Javanese or Sondaic rhinoceros (*Rhinoceros sondaicus*) is a much smaller species, also one-horned, found from Bengal to Java. Its armor has a tessellated appearance, and the female is hornless. The Sumatran or hairy rhinoceros (*Rhinoceros sumatrensis*) is so distinct that some naturalists have placed it in a separate genus (*Ctorhinus*). It ranges from northeastern India to Borneo, has a more hairy coat than the others, and two short blunt horns, one behind the other. A hairy-eared race (var. *lasiotis*) inhabits Assam.



The two species of African rhinoceros differ from the Asiatic ones mainly in the absence of incisor teeth and in the smoother unfolded skin, and they have each been put into a separate genus, *Diceros* and *Ceratotherium*, by some naturalists. The more familiar and widespread of the African rhinoceroses is the common or black one (*Rhinoceros*, or *Diceros, bicornis*), formerly abundant all over the eastern and

RHINOCEROSES

1 HAIRY RHINOCEROS (Dicerorhinus lasiotis)

3. AFRICAN SQUARE-LIPPED RHINOCEROS (Ceratotherium simum).
4. INDIAN RHINOCEROS (Rhinoceros unicornis).

south-central parts of the continent, but now become rare and restricted. It is not black, but bluish lead-color, if anything rather lighter than the other species usually called white. This rhinoceros stands 5½ feet at the withers in the case of large males or bulls and has two horns. The front one, usually much the longer in South African examples, sometimes attains a length of more than 50 inches, but is always less in northern specimens. The rear horn varies from a mere knob to a length almost equal to its fellow and is usually straighter and much compressed. The upper lip is pointed, extensible, and prehensile, and this species feeds almost wholly on leaves, twigs, and roots. It frequents bushy and rocky districts rather than open plains. It spends the day in an accustomed lair well hidden from observation and starts at sunset for a drinking place along a well-trodden path. Having drunk, it will wander about, feeding during the night, will drink again at daybreak, and then return to its resting place. Some hunters regard this rhinoceros as naturally ferocious and vindictive, while others consider it stupid and timid but subject to sudden panics, in which it is as likely to rush headlong towards the hunter as away from him. At best, however, it is dangerous, and its speed and agility are extraordinary. The other African species, the white Burchell's or square-mouthed rhinoceros (*Rhinoceros simus*, or *Ceratotherium simum*), is larger than the *bicornis*, the biggest, indeed, of the entire tribe, and differs from the other prominently in having a blunt squarish muzzle, the upper lip not being at all prehensile. In conformity with this it is a grazing, not a browsing animal. Both species have been divided into several subspecies.

Fossil Rhinoceroses. The existing species are the lone remnants of a once numerous group that abounded in North America from Eocene to late Miocene time and in Europe from Eocene to Pliocene time. The fossil and living species may be grouped under three families. The Hyracodontidæ, represented by the genera *Hyrachyus* and *Hyracodon* of Eocene and Oligocene time, comprised hornless, lightly built animals adapted for running on the uplands. They show a tendency to reduce the number of functional digits of the feet from five to three and thus to parallel the evolution seen in the horse's hoof. The Amynodontidæ, comprising the American genera *Amynodon*, *Metamynodon*, and the European *Cadurocotherium*, were heavily built, short-bodied animals adapted to more or less aquatic habits of life. The skull was hornless, and the eyes were situated high on the head. The upper incisors are reduced, and the canine teeth are enlarged to form tusks for use in uprooting water plants. The true rhinoceroses (Rhinocerotidæ) began as light-limbed runners without horns, that lived at the same time as the members of the two preceding families. After the hyracodonts and amynodonts had become extinct the rhinoceroses began to adapt themselves to the habits of life of their predecessors and evolved along six different lines of descent. A gigantic animal, *Elasmotherium*, found in the Pleistocene deposits of northern Asia, thought to have descended from *Aceratherium*, attained a length of 15 feet and had two large horns in tandem and prismatic teeth. The woolly rhinoceros (*Atelodus antiquitatis*) is found fossil in the Pleistocene deposits of England and in the cave deposits of Europe, and its complete carcasses have been obtained from the frozen mud banks of the tundras of northern Siberia. It was a large two-horned species, with a heavy fur of coarse woolly hair.

Bibliography. The best general account of African rhinoceroses is by Theodore Roosevelt in his *Life Histories of African Game Animals* (New York, 1914). Consult also: W. T. Blandford, *Fauna of British India: Mammals* (London, 1888–91); Baker, *Wild Beasts and their Ways* (ib., 1890); Hornaday, *Two Years in the Jungle* (New York, 1885); Drummond, *Large Game . . . of Southeast Africa* (Edinburgh, 1875); and similar books of naturalists and sportsmen relating to southern Asia and Africa; H. F. Osborn, "The Extinct Rhinoceroses," in *Memoirs of the American Museum of Natural History*, vol. i, part iii (New York, 1898); id., "Phylogeny of the Rhinoceroses of Europe," in *Bulletin of American Museum of Natural History*, vol. xiii (ib., 1900). See HUNTING BIG GAME, and Colored Plate of PACHYDERMS.

RHINOCEROS BEETLE. A name in the South for a large scarabæoid beetle (*Dynastes tityus*). It is most abundant in the Southern Atlantic States, but extends west to New Mexico and north to Cape May and southern Pennsylvania. It is a large beetle, nearly 2½ inches in length, and is stout. The male has two long

A MALE RHINOCEROS BEETLE.

horns, one extending forward from the head and the other from the thorax, from which fact it derives its popular name. The female resembles the male, but lacks the horns. It is pale bluish gray in color and the wing veins are marked with darker irregular spots. The egg is ⅛ of an inch in length and is laid in rich earth or decaying trunks of old trees of several varieties. The insect in all stages has a very strong and disagreeable odor.

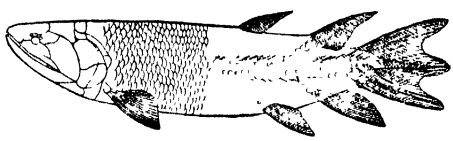
RHINOCEROS BIRD. 1. An oxpecker or buffalo bird (qq.v.), which settles upon the backs of rhinoceroses. 2. A hornbill.

RHINOCEROS HORNBILL. See HORNBILL.

RHI'NODER'MA (Neo-Lat., from Gk. *ῥίς, rhis*, nose + *δέρμα, derma*, skin). A small frog (*Rhinoderma darwini*) of Chile, remarkable for its bell-like voice and for the fact that the internal vocal sacs in the throat of the male are converted into nests for the eggs, which hatch there, whereupon the sacs become nurseries for the 5–15 tadpoles until they reach maturity. Consult Hans Gadow, "Amphibia and Reptiles," in *Cambridge Natural History*, vol. viii (London, 1901).

RHI'NOPLAS'TIC OPERATION (from Gk. *ῥίς, rhis*, nose + *πλάσσειν, plassein*, to mold).

When a portion or the whole of the nose has been destroyed by accident or disease, the deficiency may be restored by a transplantation of skin from an adjoining healthy part. After freshening the stump of the old nose a suitable flap of skin is dissected from the forehead until it hangs by a narrow strip or pedicle between the eyebrows. The flap is then twisted on itself so that its skin surface is outward while its raw surface is brought into position to correspond with the original stump, to which it is then accurately sutured. The raw surface left upon the forehead is covered by undermining the surrounding skin and bringing the edges together, or grafting portions of skin from other parts of the body upon it. This is the so-called Indian method. In the Italian method, first carried out by Tagliacozzi, the flap is taken from the arm, over the biceps, the arm being strapped into position and kept there until the graft has taken, when the pedicle is severed and the arm released. The results obtained by either of these methods are apt to prove unsatisfactory from a cosmetic as well as a functional standpoint. The engrafted tissue being unsupported by bony framework, generally shrinks into a formless mass, and difficulty is experienced in keeping the nostrils open. On the whole, a well-fitting artificial nose of celluloid or rubber is preferable in the majority of cases. Many ingenious modifications of the above methods have been tried, and American surgeons are rapidly developing great skill in the repair of these defects. Carter has modified the Indian method by first engrafting a piece of rib into the flap and suturing this into place after the bony graft has taken. Fingers have been used, the knuckle forming a tip. Flattened noses are successfully elevated by the transplantation of a thin section of bone taken from the rib or tibia and inserted under the skin so as to form a bony ridge. Consult F. H. Kolle, *Plastic and Cosmetic Surgery* (New York, 1911). See AUTOPLASTY; SKIN GRAFTING.



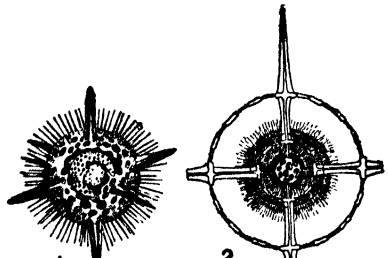
RHINS, rĭn, JULES LÉON DUTREUIL DE (1846–94). A French geographer and explorer, born at Saint-Etienne. He took part as a midshipman of naval volunteers in the expedition to Mexico and was an ensign during the Franco-Prussian War. From 1871 to 1876 he was captain of a foreign-going ship, in 1876–77 commanded the *Scorpion* of the King of Annam's navy, and in 1882 was Egyptian correspondent of the *Temps*. From 1891 to 1894 he explored Chinese Turkestan (East Turkestan) and the most inaccessible and least-known regions of northern and western Tibet. He was murdered by natives at a small town of eastern Tibet. His publications include: *Le royaume d'Annam* (1879); *Carte de l'Indo-Chine orientale* (1881); *Levé du cours de l'Ogooné* (1884); *L'Asia centrale* (1889). The results of his last journey were edited by his assistant, Grenard, *Mission scientifique dans la Haute-Asie* (3 vols., 1897–99).

RHINTHON, rĭn'thŏn (Lat., from Gk. *Ῥινθων*) (c.325–c.285 B.C.). A Greek comic poet of Tarentum. He was the first to develop in a written form and to introduce into Greek literature the so-called Hilarotragœdia (*Ἱλαροτραγῳδία*), a species of burlesque tragedy in which the tragic myths were treated in the spirit and style of comedy. The *Amphitruo* of Plautus (q.v.) has been characterized as "an exalted *Rhinthonica*"; consult A. Palmer's edition of that play, page xv (London, 1890). Rhinthon is often quoted by Cicero and Varro and by Athenæus, Hesychius, and other Greek writers, but of his 38 dramas only insignificant fragments are extant. Consult Völker, *Rhinthonis Fragmenta* (Halle, 1887), and Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. ii, part i (5th ed., Munich, 1911).

RHI'ZOCAR'PEÆ. See PALEOBOTANY.

RHI'ZOCEPH'ALA (Neo-Lat. nom. pl., from Gk. *ῥιζοκέφαλος, rhizokephalos*, having the flower growing immediately from the root, from *ῥίζα, rhiza*, root + *κεφαλή, kephalē*, head). An order of most degraded cirripeds, the root barnacles, especially of the genera *Sacculina* and *Peltogaster*. The few forms known are parasitic on the abdomens of various crabs.

RHI'ZODON'TIDÆ (Neo-Lat. nom. pl., from Gk. *ῥίζα, rhiza*, root + *ὀδούς, odous*, tooth). A family of carnivorous Paleozoic fishes of the crossopterygian suborder Rhipidistia, in which the median fins are always more or less subdivided by a process of concentration analogous



EUSTHENOPTERON FOORDI.

to that prevalent among dipnoans. The notochord was persistent, and the jaws bore many peculiar teeth. These teeth were highly complicated in the Holoptychidæ, less so in the Rhizodontidæ, with a larger central cavity. A well-known example, found in an unusually good state of preservation, is *Eusthenopteron foordi*, herewith figured, which abounds in the Devonian rocks of Quebec and whose pectoral fin has only one stout basal cartilage, an archipterygium All were small fishes. Consult S. P. Woodward, *Vertebrate Paleontology* (Cambridge, 1898).

RHI'ZOIDS (from Gk. *ῥιζωδής, rhizōdēs*, root-like). Colorless, hairlike structures developed by liverworts, certain algæ, mosses, and fungi (toadstools and molds). Their function is to anchor the plant in favorable situations and in some cases perhaps to absorb water. The ferns have rhizoids only in connection with the very small prostrate sexual plant (prothallium, q.v.).

RHIZOP'ODA (Neo-Lat. nom. pl., from Gk. *ῥίζα, rhiza*, root + *πούς, pous*, foot). The first and lowest class of Protozoa (q.v.); a large

1, a radiolarian, showing the interior; 2, cross section of the same through the processes.

assemblage of varying forms agreeing in the possession of projections of the body protoplasm called pseudopodia. These pseudopodia are used

as organs of locomotion and also for obtaining food. They may be of very irregular and constantly changing shape or comparatively rigid, independent of each other or forming a very complex network. The protoplasm or sarcode of a rhizopod consists of an outer layer called ectosarc, which is thin, transparent, and homogeneous, and an inner portion called endosarc, which is granular and more opaque. Most of the numerous species are spherical with radiating pseudopodia, but the lowest forms have no constant shape. Most rhizopods are provided with some sort of shell, but the lowest forms have no such covering. The simplest shells are those made up of particles of dirt or foreign material of some sort, united together by some secretion of the ectosarc; in other cases the shell is formed of a horny material called acanthin or of carbonate of lime or silica, often in a very remarkable and elaborate pattern. Generally rhizopods are freely moving animals, but some are attached in adult life by stalks. The individuals are usually distinct, but colonial rhizopods are known, and such colonies are sometimes half an inch across.

The only internal organs of the Rhizopoda are the vacuoles, those which contain more or less digested food and those which contain the waste matter or excreta of the body. The latter are the larger and more conspicuous, and, owing to the sudden collapse when the excreta are thrown out of the body, are known as contractile vacuoles. Reproduction takes place by simple budding or fission, the two processes differing only in the relative size of the resulting individuals. The formation of spores, however, occurs in many cases, especially after a resting period. Such resting periods occur during unfavorable conditions such as prolonged cold or drought or when an unusual amount of food has been taken. In most cases during such a resting period the rhizopod surrounds itself with a firm, impervious coat, called a cyst. When the unfavorable conditions cease the sarcode divides up into several minute spores, each of which on the dissolution of the cyst becomes a new individual. The growth of these individuals is rapid when food is abundant. Consult: Joseph Leidy, *Fresh Water Rhizopods of North America* (Washington, 1879), Bütschli, "Protozoa," in Bronn, *Klassen und Ordnungen des Thierreichs* (Leipzig, 1887); M. M. Hartog, "Protozoa," in *Cambridge Natural History*, vol. i (New York, 1906).

RHODAMINE, rō'dȧ-mĭn *or* -mēn. See Coal-Tar Colors.

RHOD'ANUS. See Rhone.

RHODE ISLAND. One of the New England States of the United States, officially known as the State of Rhode Island and Providence Plantations, situated between lat. 41° 18′ and 42° 3′ N. and long. 71° 8′ and 71° 53′ W. Rhode Island is the smallest in area of the States of the United States. It has an extreme length from north to south of 48 miles and an extreme width from east to west of 36 miles. Its area is 1248 square miles, of which 1067 square miles are land surface.

Topography. The State belongs to the eastern Appalachian belt known as the Piedmont belt. It is rough and hilly, though the general elevation is not great, a small section only in the northwest being above 500 feet. The highest point is Durfee Hill, in Glocester, in the northwestern part; its altitude is 805 feet. The Atlantic coast line is bordered by lagoons and marshes, so that the approach to the State from the sea is possible only through the shallow Pawcatuck River in the southwest and in the east by Narragansett Bay, a large, irregular, and branching inlet extending 28 miles inland, with a breadth of from 12 to 3 miles. It incloses a number of islands, the largest of which are Aquidneck or Rhode Island, Conanicut, and Prudence Island. Aquidneck, with bold cliffs and fine beaches, containing the city of Newport, is a beautiful island, 15 miles long and 3 miles wide. Nine miles off the coast lies Block Island, 15 square miles in extent, made up entirely of morainic material, presenting in a typical manner the rough, rolling topography, and interspersed with numerous miniature freshwater lakes. The rivers of the State are small. The three largest are the Blackstone and the Pawtuxet in the north, flowing into the north end of Narragansett Bay, and the Pawcatuck in the south, flowing into the Atlantic Ocean on the Connecticut boundary. All of these are rapid streams, with a number of falls supplying considerable water power. Like all glaciated areas, the State is studded with numerous small lakes.

Climate and Soil. The climate is mild and equable compared with that of the interior of New England. Its position on the southern shore, protected from the cold winds striking the east coast of New England, is its main asset. The mean temperature for January is 36° and for July 76°. The average relative humidity ranges between 80 and 95 per cent throughout the year. The average rainfall is about 45 inches, ranging in localities from 40 inches in the north to nearly 50 on the coast. The soils are in general coarse, stony, and not well adapted for agriculture, but about 21 per cent of the State has a general-farming soil.

Geology. Archean rocks, chiefly gneisses, form the surface of the western half of the State to within 3 miles of Narragansett Bay. The Narragansett basin, including the bottom of the bay, its islands and both shores, together with a region running northeast into Massachusetts, forms an interesting patch of Carboniferous deposits. It seems to have been a shallow trough undergoing a continual subsidence as the coal beds and intervening strata were laid down, until the whole deposit attained a thickness of several thousand feet. The basin has since been subjected to folding movements, in which process the strata were crushed and faulted and the coal converted into graphitic anthracite and locally almost or wholly into pure graphite. These anthracite beds, worth about two-thirds as much as Pennsylvania anthracite, form the principal mineral deposits of the State, but access to large portions of them is difficult owing to the proximity of the bay.

Mining and Mineral Products. Rhode Island is of small importance as a producer of minerals. Quarries in the State in 1913 yielded stone to the value of $643,995. Other minerals produced on a commercial scale are mineral waters, lime, amorphous graphite, soapstone, coal, and clay products; the total value of such products was $813,952 in 1913.

Agriculture. Of an approximate land area of 682,880 acres, 443,308 acres were in farms in 1909. Improved land in farms amounted to 178,344 acres. The farms, numbering in that year 5292, averaged 83.8 acres in size. The

average value of farm land per acre was $63.01. The total value of farm property, including land and buildings, implements and machinery, domestic animals, poultry, and bees, was $32,990,739.

Of the total number of farms 4338 were operated by owners and managers and 954 by tenants. The native white farmers numbered 4408 and the foreign-born white 843. There were also 41 negro and other nonwhite farmers. Of the foreign-born white farmers 161 were born in England, 150 in Canada, and 115 in Ireland.

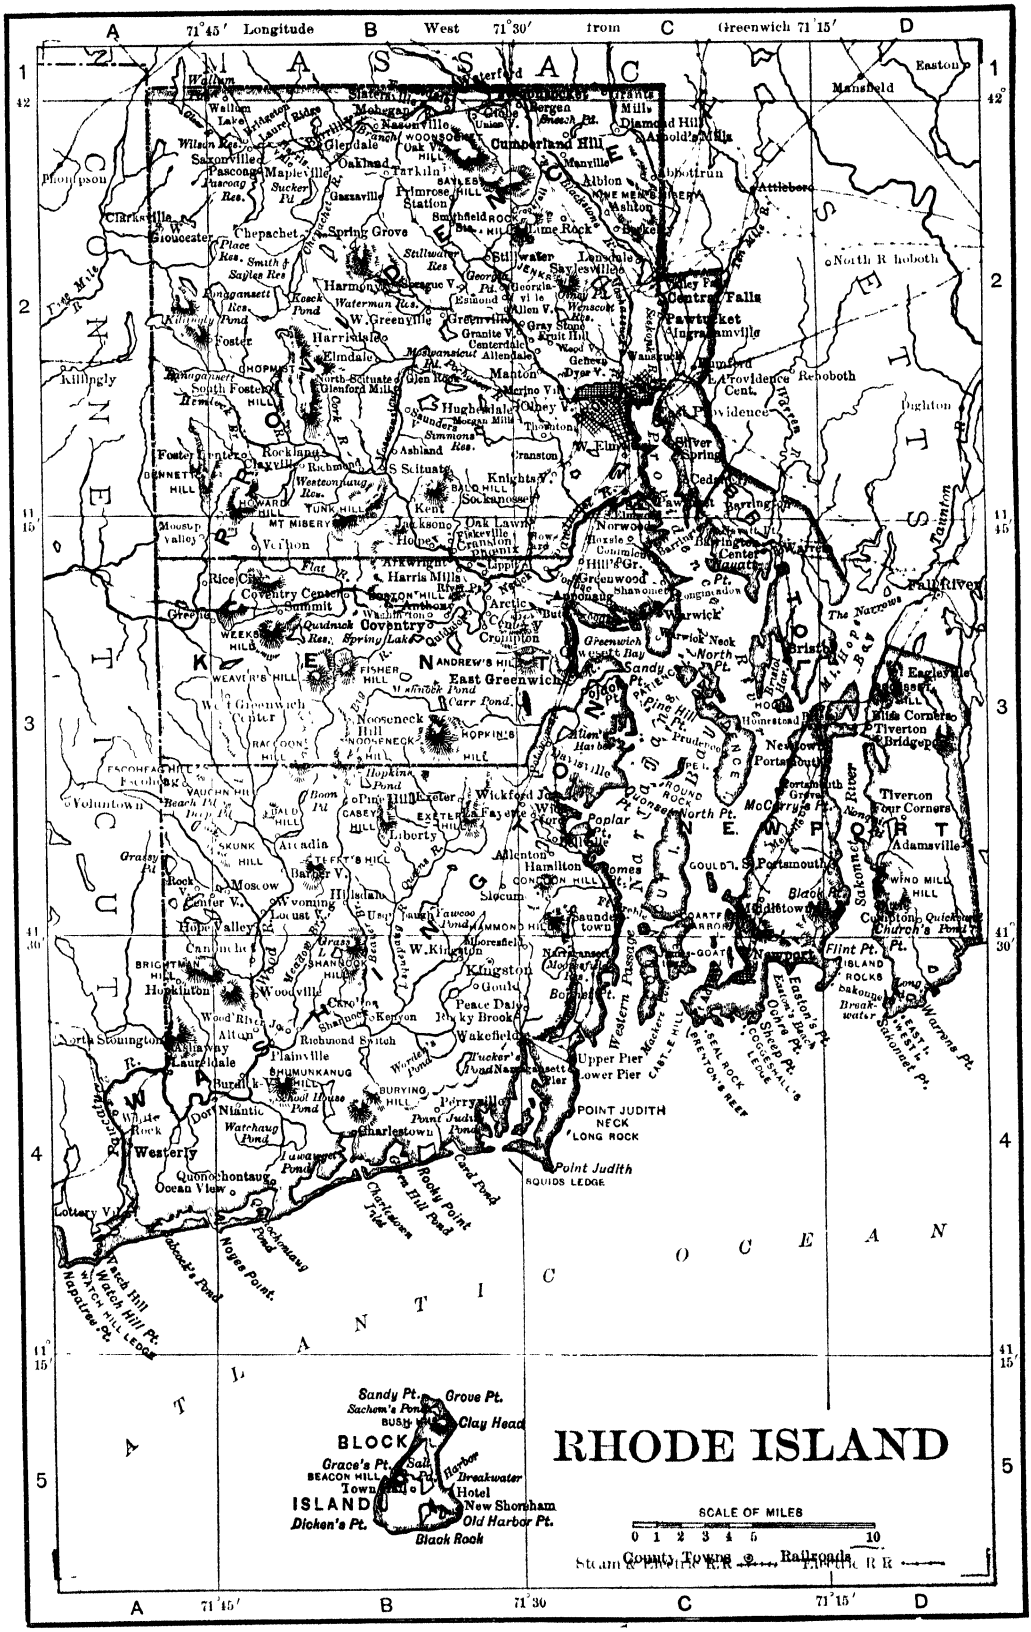
The following table gives the acreage, production, and value of some of the leading crops as estimated by the United States Department of Agriculture in 1914.

CROPS	Acreage	Production in bushels	Value
Corn	11,000	462,000	$453,000
Oats	2,000	55,000	32,000
Potatoes	5,000	825,000	578,000
Hay	58,000	68,000*	1,374,000

* Tons.

In 1909 the total value of farm crops was $3,937,000. About one-third of this value was contributed by hay and forage. The leading crops in order of their importance are hay and forage, potatoes, corn, and oats. There were devoted to hay and forage 61,327 acres, which produced 80,306 tons, valued at $1,309,717; 9679 acres of corn, producing 398,193 bushels, $335,629 in value. The acreage of potatoes was 4649, the production 552,677 bushels, and the value $408,429. Oats, the only other crop to show a production valued at as much as $10,000, had an acreage of 1726, a production of 48,212 bushels, and a value of $28,661. Potatoes and other vegetables had an acreage of 9924 and a value of $1,045,000. Excluding potatoes, the acreage of vegetables was 5275, the value of the production being $637,000. Some 502 acres were devoted to flowers and plants and nursery products, the value of these products being $634,000. Strawberries are by far the most important small fruit. There were grown 326,540 quarts of them in 1909, and their value was $31,712. Raspberries are next in importance. The total output of small fruits was 437,560 quarts, valued at $43,033. Apples contributed about seven-eighths of the total output of orchard fruits. This fruit had in 1909 a production of 212,908 bushels, valued at $147,125. Peaches and pears are next in importance. The total value of orchard fruits was $197,639. There were also grown 152,937 pounds of grapes, which had a value of $9759.

Dairy and Live-Stock Products. The total value of domestic animals on farms in 1910 was $2,902,316. According to the estimates of the Department of Agriculture, there were on the farms on Jan. 1, 1915: horses, 10,000, valued at $1,460,000; milch cows, 23,000, valued at $1,663,000; cattle other than milch cows, 11,000, valued at $295,000; sheep, 7000, valued at $36,000; swine, 15,000, valued at $202,000. The total value of milk, cream, and butter fat sold, and butter and cheese made in 1909, was $2,065,941. Milk sold amounted to 8,796,847 gallons, valued at $1,903,546; the butter made to 339,607 pounds, valued at $104,161.



Fisheries. Rhode Island ranked twelfth among the States in value of fishery products in 1908. There were employed in this industry 1404 men, and equipment in use was valued at $877,000. The total investment was $1,504,000. The catch of oysters, the most important of the fishery products, was valued at $969,500. Next in importance are scup, with a catch valued at $158,000, and lobsters, $152,000. Some of the other most important products of the fisheries with their value are: squeteague, $72,000; flatfish and flounders, $50,000; menhaden, $48,000; hard clams, $39,000; soft clams, $38,000; cod, $42,000; butterfish, $42,000. The total value of fishery products was $1,752,000.

Manufactures. The smallest State in the Union and thirty-eighth in population, Rhode Island ranked fourteenth in the value of manufactured products in 1909. With about 96 per cent of its population urban in character, the State is essentially a manufacturing community. In 1909 the per capita value of manufactured products was $517. The table on page 773 shows the most important figures for the 10 leading industries as judged by value of products in the year 1909.

The manufacture of textiles is by far the most important industry. Combined, the four branches of this industry employed 57,169 wage earners in 1909. The value of their products was $133,363,000, representing about 48 per cent of the State's total value of manufactured products. The most important branch of the textile industry is the manufacture of woolen and worsted goods, in the production of which Rhode Island ranked third among the States. In 1909 the number of producing spindles was 459,127 and of looms 9252. The quantity of woolen goods woven was 53,661,591 square yards in that year. The cost of materials in 1909 was $51,025,376. Rhode Island ranked fourth among the States in the production of cotton goods. The cotton industry, which ranks second, dates back to 1790, when the first mill in the United States was started at Pawtucket. The number of producing spindles employed in the manufacture of cotton in 1909 was 2,363,689 and the looms used, 81,093. The value of the material consumed was $25,401,239. In the manufacture of jewelry the State ranked second in 1909.

Of the wage earners engaged in industry in 1909, 74,549 were male and 38,989 were female. Wage earners under 16 years of age numbered 4625. The prevailing hours of labor ranged from 54 to 60 a week for the large majority of wage earners.

Providence, the only place with more than 100,000 inhabitants, is the most important manufacturing city. The number of wage earners employed in 1909 was 46,381 and the total value of products for 1080 establishments was $120,241,000. The manufacture of woolen and worsted goods is the most important industry, of which the value of products was $29,926,448 in 1909. The manufacture of jewelry and allied industries in the State is almost entirely confined to this city. This ranks second among the industries of the city in value of products. Pawtucket ranks second to Providence in the value of its manufactured products. This in 1909 was $37,696,186 for 217 establishments. The most important industry here is textile manufactures. The value of products of the cotton mills in 1909 was $14,337,874. Foundry and machine-shop products ranked second in importance. Woonsocket and War-

wick followed Pawtucket in industrial importance. The woolen mills in the former contributed 70.5 per cent and the cotton mills of the latter 77.8 per cent of the total value of products of the respective cities. See also under the individual titles.

members of both Houses of the General Assembly, and must be approved by a majority of the members of two consecutive Legislatures and by three-fifths of the electors voting, before becoming part of the constitution. The seat of the government is Providence.

SUMMARY OF MANUFACTURES FOR 1909 AND 1904

THE STATE — TEN LEADING INDUSTRIES

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED IN INDUSTRY: Total	PERSONS ENGAGED IN INDUSTRY: Wage earners (average number)	Capital	Wages	Value of products	Value added by manufacture
					Expressed in thousands			
All industries	1909	1,951	122,641	113,538	$290,901	$55,234	$280,344	$122,152
	1904	1,617	104,299	97,318	215,901	43,113	202,110	89,238
Bread and other bakery products	1909	187	1,401	1,055	1,436	659	3,937	1,466
	1904	174	1,228	964	1,056	570	3,054	1,230
Cotton goods, including cotton small wares	1909	106	29,488	28,786	67,679	11,797	50,313	24,912
	1904	99	25,425	24,758	47,477	8,890	34,573	14,907
Electrical machinery, apparatus, and supplies	1909	12	1,730	1,601	4,315	678	6,410	1,815
	1904	11	1,531	1,409	3,608	557	5,435	1,418
Foundry and machine-shop products.	1909	141	11,905	10,937	27,011	6,900	20,612	12,598
	1904	143	9,498	8,617	23,883	4,676	14,194	9,180
Gold and silver, reducing and refining, not from the ore.	1909	15	142	82	711	57	4,442	271
	1904	10	120	77	599	55	4,261	274
Hosiery and knit goods	1909	17	1,849	1,774	2,878	635	3,866	1,422
	1904	15	1,802	1,721	2,277	574	3,345	1,074
Jewelry	1909	296	11,002	9,511	17,050	4,761	20,685	10,897
	1904	197	7,507	6,475	11,199	3,365	14,432	7,774
Silk and silk goods, including throwsters.	1909	13	1,750	1,685	3,496	788	4,584	1,396
	1904	8	1,326	1,291	2,652	480	2,556	860
Silverware and plated ware	1909	11	2,517	2,294	9,422	1,568	6,198	3,563
	1904	10	2,067	1,919	8,582	1,440	5,323	2,900
Woolen, worsted, and felt goods, and wool hats	1909	88	25,673	24,924	68,867	11,538	74,600	23,575
	1904	82	22,090	21,610	45,600	9,102	52,641	16,705

Transportation. The only river large enough to bear commercial transportation is the Providence River, which is navigable to Providence. The harbor is shallow, and while a good deal of coastwise trade is carried on from here and from other ports on Narragansett Bay, there is little accommodation for large ships engaged in foreign commerce. The main outlet for Rhode Island's manufactures is the New York, New Haven, and Hartford Railroad, which operated a total of 457 miles of all tracks in 1914.

Banks. The first bank of Rhode Island was the Providence Bank, founded in 1791. The name of this institution was changed in 1865 to the Providence National Bank, under which name it is still doing business. The early banking history of the State, however, centres about the Providence Institution for Savings, which is the largest savings bank in Rhode Island. The date of its charter is 1819, but is antedated by that of the Savings Bank of Newport by three or four months. The following statistics on the banks are for 1915 from the report of the State Banking Commissioner.

ITEM	National banks	Trust companies	Savings	State
Number	18	13	15	3
Capital	$6,070,000	$8,047,000		$520,000
Surplus	4,561,000	7,018,000	$2,271,000	218,000
Cash, etc.	2,174,000	6,332,000	785,083	317,820
Loans	29,659,000	67,313,000	33,507,924	2,594,429
Deposits	30,136,000	114,881,000	83,478,000	2,956,662

Government. The present constitution was adopted in 1842 and has been amended in several important details since that date. Amendments may be proposed by a majority of the

Executive.—The chief executive is the Governor. Other officers are the Lieutenant Governor, Secretary of State, Attorney-General, and General Treasurer. These are all elected at town and district meetings every two years. Prior to 1912 elections for State officials were annual. The Governor has power to convene the General Assembly in any town or city in the State at any time not provided for by law. The Governor has the power of veto, which was granted to him by a constitutional amendment adopted in 1909.

Legislative.—The legislative power is vested in two Houses, the Senate and the House of Representatives Both together are called the General Assembly. The House of Representatives must never exceed 100 members and is constituted on the basis of population. Every town and city is entitled to at least one member, but no town or city must have more than one-fourth of the whole number of members. Prior to 1909 the limit of membership was 72. The Senate consists of the Lieutenant Governor and of one Senator from every town and city in the State. By an amendment passed in 1909 the Lieutenant Governor was made the presiding officer in the Senate and in grand committee.

Judiciary.—The judicial power is vested in a supreme court and subordinate courts. The supreme court is composed of five judges, of whom one is the Chief Justice, elected by members of the two Houses in grand committee. The supreme court has final revisory and appellate jurisdiction in all questions of law and equity. The superior court was created by an act of the General Assembly and consists of a Chief Justice and six associates. The State is divided into 12 judicial districts, each of which is presided over by a justice of the district

court. The city of Providence has a special police court.

Suffrage and Elections.—Every male citizen of the United States, of the age of 21, who has resided in the State for two years, and in the town or city in which he offers to vote for six months, preceding the time for his voting and whose name has been registered before the last day of June in the year next preceding the date of voting, has the right to vote. No person, however, may at any time vote in the election of the city council of any city, or for any proposition to impose a tax, or for the expenditure of money in any town or city, unless he shall within the year next preceding have paid a tax assessed upon his property which must be valued at at least $134. Every adult male is also obliged to pay a poll tax of $1, which is applied to the support of the public schools. The general State election is held on the Tuesday following the first Monday in November biennially, dating from 1912. There is no system of primary elections for the nomination of officers. State officials are nominated at State conventions, to which the delegates are elected at party caucuses. Towns are governed by town meetings.

Miscellaneous and Statutory Provisions.—The hours of labor for women and children in manufacturing and mechanical establishments are limited to 54 in any one week. In 1912 there were created a public-utilities commission, a board of tax commissioners, and a board of control and supply. The State is under license.

Finances. The paper-money system, which was prevalent throughout all the Colonies, kept Rhode Island's finances in a continual state of disorder. The Revolution left the State with a large debt and heavy taxes, and this condition of affairs was not remedied until Rhode Island joined the Union. In 1789 the Revolutionary debt was repudiated by the passage of the compulsory-tender act compelling creditors to accept paper money at an arbitrary rate. On Jan. 1, 1914, the balance on hand in the treasury amounted to $15,758.34. The total receipts during the year were $3,142,243.04 and the expenditures $3,095,584.26. There was a balance on hand of $2,417.12 on Jan. 1, 1915. The total bonded debt was $6,917,000. From this sum, however, there should be deducted a sinking fund of $844,955.50.

Militia. In 1910 the number of males of militia age (18 to 44 years) was 125,313. The organized militia in 1914 consisted of 3 troops of cavalry, 1 battery of field artillery, and 17 companies of coast artillery. The number of men was 1303 enlisted and 96 commissioned.

Population. The population of Rhode Island at various periods (estimated before 1748) was: 1658, 1200; 1675, 3000; 1689, 5000; 1730, 17,935; 1748, 32,773; 1774, 59,707; 1782, 52,391; 1800, 69,122; 1820, 83,059; 1840, 108,830; 1860, 174,620; 1880, 276,531; 1890, 345,508; 1900, 428,556; 1910, 542,610; 1915 (State census), 595,986. In 1910 the State ranked thirty-eighth in the Union in population and first in density, 508.5 persons per square mile. The inhabitants are essentially urban in character, 524,654 living in places of 2500 or over in 1910. By sex the population was divided into 270,314 males and 272,296 females. The native-born whites numbered 363,469, of whom 96,353 were born in other States. Of those born in other States 11.1 per cent came from Massachusetts, 3.8 per cent from Connecticut, and 3.4 per cent from New York. The number of foreign-born whites in 1910 was 178,025, to which Canada contributed 41,894, or 23.5 per cent; Ireland, 29,715, or 16.7 per cent; England, 15.6 per cent; Italy, 15.3 per cent. There were 9529 negroes, 284 Indians, and 272 Chinese. The males of voting age numbered 163,834 in 1910. There were nine cities in 1910 with over 10,000 inhabitants. These with their population in 1910 and 1915 (State census) are: Providence, 224,326 and 247,660; Pawtucket, 51,622 and 55,335; Woonsocket, 38,125 and 40,075; Newport, 27,149 and 30,472; Warwick, 26,629 and 29,084; Central Falls, 22,754 and 23,708; Cranston, 21,107 and 26,940; East Providence, 15,808 and 18,584; Cumberland, 10,107 and 9929.

Education. The State has an effective educational system, well administered. The presence of a large body of foreign population adds a difficulty to the educational problems and also increases the percentage of illiteracy, which in 1910 was 7.7 per cent of the total population, a higher percentage than is found in any other of the New England States. The total number of illiterates in that year was 33,854, and of these 29,781 were foreign-born whites. The percentage among native whites was 0.7. The total school population in 1910 (6 to 20 years) was 148,102; of these 90,328, or 61 per cent, attended school in that year. The school population in 1915 (ages 5 to 15 years inclusive) was given by the commissioner of public schools as 110,198. The total enrollment in the school year 1913–14 was 86,505. There were 2586 teachers, of whom 2369 were women and 217 were men. The total expenditures for public schools in 1913–14 was $2,868,854. The Legislature of 1914 passed a law requiring a minimum school term of 36 weeks. The General Assembly in 1913 enacted a law designed to encourage industrial instruction and providing State aid. There is an excellent system of high and secondary schools. The high schools in 1914 numbered 22. Towns are entitled to receive State aid for the support of high schools provided the courses of education are approved by the State Board of Education and provided also that pupils of other towns are admitted to the extent of the capacity of the schools at a rate of tuition not to exceed the average cost per capita of maintaining the schools. Every town is required by law to provide high-school education for its youth. Provision has been made for the supervision of public schools, and in 1908 measures were passed by the Legislature insuring a proper standard of school supervision. In 1915, 23 professional superintendents were in service. There is a normal school in Providence which maintains more than 30 training schools or stations in different parts of the State. Special schools are the Rhode Island School of Design, at Providence; Rhode Island School for the Feeble-Minded, at Exeter; the Rhode Island Institute for the Deaf, at Providence; and the State Home and School for Children, in Providence. Institutions for higher education are the Rhode Island State College, at Kingston, a State institution, and Brown University, at Providence.

Charities and Corrections. A State board of charities and corrections has control of the State institutions. These are situated upon what is known as the State Farm in the city of Cranston, and comprise the State Hospital for

the Insane, the State Almshouse, the State Workhouse and House of Correction, the State Prison and Providence County Jail, the Sockanosset School for Boys, and the Oaklawn School for Girls. The two latter institutions are departments of the State Reform School. The total number of inmates in these several institutions on Jan. 1, 1915, was 3160. Other charitable institutions are the Rhode Island Soldiers' Home, at Bristol; the Butler Hospital, at Providence; and the State Sanatorium for Consumptives, at Wallum Lake.

Religion. The number of communicants of the Roman Catholic church in 1908 was 178,160, about one-fourth of the population of the State. Among the Protestant bodies the Baptists are the strongest, consisting of about one-third of the total Protestant strength. The Protestant Episcopalians rank third.

History. The stories of Norse exploration within the present limits of the State rest upon slight foundation. True history begins when Roger Williams (q.v.) was banished from Massachusetts Bay and settled with a few companions at Providence Plantations, on land purchased from the Narraganset Indians, probably in June, 1636. Already, however, William Blackstone, who had fled from the tyranny of the lords brethren in Massachusetts, as he had left England to escape the lords bishops, had settled near Pawtucket River. In March, 1638, a band of Antinomians banished from Massachusetts Bay, under the leadership of William Coddington and John Clarke, and including William and Anne Hutchinson (q.v.), made a settlement at Pocasset (Portsmouth), on Aquidneck Island (Rhode Island). The next year a secession from this settlement founded Newport, but in 1640 these two towns were united under William Coddington as Governor. In 1643 Samuel Gorton (q.v.) founded Warwick upon the mainland. At Providence the government was at first a pure democracy, "ignoring any power in the body politic to interfere with those matters which alone concern man and his Maker." Each of these settlements was at first independent. In 1642 it was determined to seek a patent from England, and the next year Roger Williams went to England for this purpose. Through the influence of the Earl of Warwick Parliament granted (1644) a charter uniting the settlements as the Incorporation of Providence Plantations in the Narragansett Bay in New England.

The towns at first, from jealousy and exaggerated ideas of individual importance, refused to enter into the confederation, but finally, through fear of revolutions within and of Massachusetts without, the union was formed in 1647. This jealousy lasted well into the nineteenth century and explains much of the peculiar conduct of the Colony and of the State. Complete religious toleration was granted together with the largest measure of political freedom. William Coddington, while President, sought to bring the Island into relations with the United Colonies of New England. In 1650 he went to England, and in 1651 obtained a grant of the islands within the Colony. Williams was able to have this grant vacated in 1652, but not until 1654 were the settlements again united. In 1663 the charter of Rhode Island and Providence Plantations was obtained, and this served as a constitution until 1842. During the war waged on charters by James II the charter of Rhode Island was abrogated by Sir Edmund Andros (q.v.), 1686–89, but on his deposition the old government was quietly renewed under it, though a property qualification for suffrage was added in 1724.

Relations with the other New England Colonies were unpleasant. The Colony suffered severely in the war with King Philip (q.v.), though opposed to the policy which caused it. Connecticut and Massachusetts claimed practically all of the territory included in the charter limits. The Connecticut boundary, after much wrangling, was finally settled in 1727, and the Massachusetts boundary was confirmed in 1746–47, but was not finally settled until 1861. Both of these Colonies looked on Rhode Island as a nest of heretics and a refuge for the disaffected. The Colony was shut out from the United Colonies of New England and in every way made to feel her slight influence. Nevertheless the growth of the Colony in population and wealth was steady, and many of the inhabitants turned to the sea for a livelihood. In the Colonial wars Rhode Island privateers inflicted much damage, and some of her citizens were accused of piracy. In 1775 an army of observation was organized for the defense of the Colony, and two of the 13 ships ordered by Congress were built here. Rhode Island renounced allegiance to Great Britain on May 4, 1776, and united with the other Colonies for defense. During the Revolution Newport was held (1776–79) by British troops, and in 1780 the French fleet was stationed there. The famous soldier of Rhode Island was General Nathanael Greene (q.v.). After the Revolution the State blocked every attempt to give increased power to Congress This was partly due to the prevalent exaggerated individualism and partly to the desire to retain the right to levy import duties and to force her paper money into circulation. Much paper money had been issued early in the century and in 1786 another era of inflation began. The paper issued on land mortgages depreciated, but many attempts were made to make it a legal tender. A debtor might deposit with a judge of the court the sum owed and upon notice to the creditor the debt was legally satisfied. The notices began, "Know ye," and hence the epithet applied in derision to residents of the State. The country or paper-money party was in complete control, and a test act requiring all to regard the paper as equal to specie was passed.

The State refused to send delegates to the convention which drew up the Federal Constitution, and when that instrument was submitted for approval it was overwhelmingly rejected by the town meetings. Many attempts to call a convention to consider the Constitution failed, and it was not until threats of coercion had been made that the instrument was ratified (May 29, 1790). Though the commercial and manufacturing interests of the State grew rapidly, the power still lay in the country districts, as the basis of representation had not been changed since the granting of the charter, except to admit new towns. Dissatisfaction finally culminated in Dorr's Rebellion in 1841. (See DORR, THOMAS WILSON.) A new State constitution was adopted as a result in 1842, which has been frequently amended since. The property qualification for suffrage was not abolished until 1888, and election by a plurality has been allowed since 1893. Until 1900 the Legislature

met in Newport in April to canvass the vote and adjourned to Providence in January to transact business. Now all sessions are held in Providence. A prohibitory amendment to the constitution was adopted in 1886, but was repealed in 1889.

The Democrats in 1907 elected James H. Higgins Governor. During this entire year the State had only one Representative in the United States Senate, owing to the failure of the Legislature to agree upon a candidate. The Legislature on Jan. 21, 1908, finally reëlected George P. Wetmore, Republican, United States Senator. The Republicans in this year were successful in electing their candidate, Aram J. Pothier, Governor. In the national election, November 3, the vote was as follows: Taft, 43,942; Bryan, 24,706. For Governor Pothier received 36,776 votes, compared with 31,406 for his Democratic opponent. The Republicans were again successful in 1909, reelecting Governor Pothier Three important constitutional amendments were adopted in the same year. One of these provided for redistricting the State so that the House of Representatives should have 100 members instead of 72. Another provided that the Lieutenant Governor shall preside over the Senate, and the third gave to the Governor the veto power, which he had not had hitherto. In 1910 Governor Pothier was reëlected for a third term. Charles R. Brayton, for many years the chief political power in the State and practically the dictator in matters of Republican politics, died on September 22 of this year. On Jan. 18, 1911, the Legislature elected Henry F. Lippitt, Republican, to succeed Senator Nelson W. Aldrich (q.v.). Governor Pothier was reëlected for a fourth term. A constitutional amendment providing for biennial elections was approved in this year. In the national election of Nov. 5, 1912, Wilson received 30,412 votes; Taft, 27,703; and Roosevelt, 16,878. A Republican Legislature was elected, and this body on Jan. 21, 1913, elected LeBaron B. Colt United States Senator to succeed George P. Wetmore, whose term had expired. In the State election of 1914 the Republicans elected their candidate for Governor, R. L. Beeckman.

In national politics the State has been erratic. From 1792 to 1800 she gave her vote to the Federalist electors, but in 1804 was Democratic. In 1808 and 1812 the Federalists again secured control, but in 1816 and 1820 the State was once more Democratic. Rhode Island supported the tariff wing of the Democracy in 1824, but in 1828 was National Republican (the name originally borne by the Whig party) and in 1832 Whig, only to be Democratic again in 1836. From 1840 to 1848 the Whig candidates received her votes, and in 1852 the State went back to Democracy. From 1856 to 1908 the State was Republican in national elections.

GOVERNORS

Providence had no chief executive from its organization until the union under the patent in 1647.

RHODES (Lat. *Rhodus*, from Gk. Ῥόδος). An island of Asiatic Turkey, off the southwest coast of Asia Minor (Map: Greece, Ancient, F 3). It is 49 miles long and 21 miles in greatest breadth, and is traversed in the direction of its length—from northeast to southwest—by mountains which reach in Mount Atavros (the ancient Atabyrion) a height of 4070 feet. Its area is 564 square miles. Its population in 1909, according to Baedeker, was 46,500, of whom three-fourths were Greeks. The island is governed by a Turkish pasha, but is neglected and shows few traces of its ancient prosperity. Its climate is temperate, and its valleys are fertile, producing grain, oil, oranges, citrons, etc.

Rhodes rose into importance early. Ialysus was a place of trade during the second millennium B.C., for Mycenæan (late Minoan) vases have been found in its necropolis. When the island first appears in history, it is peopled by Dorians who dwell in three cities—Lindus, near the centre of the east coast, with a good harbor, and still a town; Camirus, on the west coast; and Ialysus, also on the west coast, near the northern end of the island. These cities, with Calymna, Cos, and Halicarnassus, formed the Doric Hexapolis, which later, by the expulsion or withdrawal of Halicarnassus, became a Pentapolis. During the seventh and sixth centuries B.C. the island shared in the commercial prosperity of the Greek states of Asia Minor. Archæological discoveries on the island prove extensive trade with Phœnicia (q.v.). A colony was planted at Phaselis on the east coast of Lycia, and, alone of the Asiatic Greeks, the Rhodians took part in the first colonizing of Sicily, where they settled Gela, according to the tradition, about 690 B.C. A hundred years later, after an unsuccessful attempt at Lilybæum, another band settled the Lipari Islands. Secure from attack by land, and on friendly terms with the unaggressive naval powers of Phœnicia and Egypt, the island maintained its independence till the Persian conquest and did not finally yield till after the Ionian revolt (500 B.C.). The Rhodians served with Xerxes, though their contingent was small. After the Greek victories they joined the Delian League. (See DELOS.) They revolted from Athens in 411 B.C., and in 408 the three cities combined to found a new capital of the island. This city, Rhodes (q.v.), laid out by Hippodamus of Miletus (q.v.), henceforth represents the island. Excavations were begun on the Acropolis of Lindus in 1902 by Danish scholars, and in the first season the Propylæa and ancient Temple of Athena were discovered. Later the walls of the Acropolis were traced, a fine propylæa and staircase to the Acropolis, like those at Athens, remains of other temples and of a theatre, and many important inscriptions were found. Consult Blinkenberg-Kinch, *Exploration archéologique de Rhodes* (Copenhagen, 1904–07); K. Baedeker, *Konstantinopel, Balkanstaaten, Kleinasien, Archipel, Cypern*, 439–441 (2d ed., Leipzig, 1914).

RHODES. The capital of the island of Rhodes, at its northern extremity, with harbors on the east side (Map: Greece, Ancient, F 3). Its Acropolis was on a hill which rises abruptly from the west coast. The modern city, called Kastro, has a picturesque appearance from the sea as it rises gradually from the two harbors, now choked with sand. In ancient times the main harbor was fortified and could be closed. The present fortifications include only about one-fourth of the ancient city and date largely from the fifteenth century. The place has preserved its mediæval aspect, and there are many traces on the stone houses of its occupation by the Knights of St. John, besides the great castle, the hospital, and especially the straight and picturesque Knights' Road, lined with ancient buildings bearing coats of arms. (See SAINT JOHN OF JERUSALEM, KNIGHTS OF.) The earthquakes of 1851, 1856, and 1863 wrought great destruction in the town. By the powder explosion of 1856 the church of St. John, built in 1500, and the Grand Masters' palace were badly damaged, and the two edifices were destroyed by the earthquake of 1863. Pop., about 12,000.

Rhodes was founded in 408 B.C. and was girt by strong walls, surmounted by towers and provided with two excellent harbors. It soon attained wealth and an important commercial position. In the early years of the fourth century its history was marked by struggles between democracy and aristocracy, leading to interventions by Sparta (412–395, 391–378) and Athens (395–391, 378–357). Rhodes joined the second Athenian League, but in 356 B.C., with Byzantium, Chios, and Cos, withdrew, thus bringing about the Social War, which ended in

Athens conceding the independence of the allies. Rhodes, however, soon fell under the control of Mausolus of Caria (see MAUSOLEUM; ARTEMISIA, 2), but again became free, though in 332 B.C. it voluntarily acknowledged the sway of Alexander. This King greatly favored the city, whose trade rapidly increased, though it was occupied by a Macedonian garrison. On the death of Alexander (323 B.C.) the Rhodians rose and expelled the intruders. The third and second centuries B.C. were the acme of Rhodian prosperity. (See RHODES, LAW OF.) Art flourished; the city was filled with statues, and the famous Colossus (q.v.) was set up at the mouth of the harbor. A later school of art produced the Laocoön (q.v.). In the wars of the period the Rhodians seem to have sought to hold aloof unless their trading interests were threatened. Like the kings of Pergamum, they appealed to Rome as a better ally than their powerful neighbors and joined in the war against Philip V of Macedon and Antiochus III. Later, they endeavored to check the Roman advance against Perseus, and the Roman Senate punished them by making Delos (q.v.) a free port, with damaging effect on the Rhodian trade. After the death of Cæsar, whose side the Rhodians had taken against Pompeius in the civil war, they were defeated in a naval engagement by Cassius, who in 42 B.C. entered the city by force, massacred the hostile leaders, seized the public property, and rifled the temples. This visitation broke the power of Rhodes, but it long continued to maintain its prestige as a seat of learning. Even under the Roman Empire Rhodes maintained a nominal independence and was not attached to any province, except for brief periods, when in disgrace with the reigning Emperor. In the reorganization of the Empire by Diocletian, however, Rhodes became the centre of the Province of the Islands. It was afterward attached to the Byzantine Empire and shared its fortunes till in 1309 it was occupied by the Knights of St. John of Jerusalem, who for over 200 years maintained themselves against the Turks and even gained some foothold on the mainland. They withstood several sieges, notably one in 1480, but were attacked again in 1522 by Sultan Solyman the Magnificent and after the most heroic resistance finally found their position untenable and were forced to abandon the island.

RHODES, ANDRONICUS OF. See ANDRONICUS OF RHODES.

RHODES, CECIL JOHN (1853–1902). A South African statesman and financier, born at the vicarage of Bishop Stortford, Hertfordshire, England, July 5, 1853. In 1870 his name was entered at Oriel College, Oxford, but an affection of the lungs compelled him in the same year to sail for Natal, whence in 1871 he made his way to the diamond fields at Kimberley. He speedily acquired a large fortune and, with his health restored, returned to matriculate at Oxford in 1873. His health soon failed again, and in March, 1874, he was back in Kimberley on the advice of a physician. But from 1876 to 1881 he spent one-half of the year at Oxford and at the end of that time took his B.A. and M.A. Shrewd in the advancement of his own interests and not entirely unaffected by the loose ethics of the mining camp, he was possessed at the same time of a profound conviction of the virtues of the British Imperial system, and he made it his life plan to extend the sway of the British Empire over South Africa. In 1881 he entered the Cape Parliament; there he directed his efforts towards the establishment of cordial relations between the English and the Dutch in the Colony, and was instrumental in bringing about the annexation of Bechuanaland in 1884. This was a forward step in the extension of British supremacy in South Africa and brought the young statesman into conflict with the Boer Republic of the Transvaal, whose policy was guided by the ambitious and astute "Oom Paul" Kruger, Rhodes's one formidable rival to the end. In 1888 Rhodes obtained from Lobengula, King of the Matabele, the cession of the immense region north of the Limpopo, which speedily came to be known as Rhodesia (q.v.), and in October, 1889, the British South Africa Company was incorporated, with almost full rights of sovereignty over that territory. Rhodes was in fact the sole manager of the company's affairs, and he devoted to the development of the country the resources of the De Beers Consolidated Mines, a corporation controlling the entire diamond industry at Kimberley, organized by Rhodes in 1888.

In 1890 Rhodes became Premier of Cape Colony, retaining at the same time his post as managing director of Rhodesia. He effected much salutary legislation within the Colony; first definitely entered upon the scheme of a British Cape-to-Cairo railway; found time to crush a formidable insurrection of the Matabeles in 1893; yet found time, too, to play an unscrupulous game of politics in the Transvaal, where the discontent prevailing among the foreign inhabitants of Johannesburg afforded him the opportunity for plotting the overthrow of the South African Republic. The Jameson raid in December, 1895, coming before his schemes were fully matured, was a crushing blow for Rhodes, who now appeared before the world as the instigator of a piratical attempt on the government of a friendly nation. (See TRANSVAAL; JAMESON, LEANDER STARR.) He was forced to resign the premiership of Cape Colony, and for a time his political influence was gone. For the next three years he devoted himself to the affairs of the Chartered Company, suppressed a second insurrection of the Matabeles in 1896–97, and hastened the northward advance of his transcontinental railway and telegraph lines. In 1898 he reëntered the Cape Parliament and had made some progress towards regaining his predominant position in South African affairs when the Boer War broke out. During the early part of the war he was besieged at Kimberley, where he was attacked by his old illness. He

went to Egypt in the early part of 1901, but, failing to find health there, returned in February, 1902, to Cape Colony and died at Muizenberg, near Cape Town, March 26, 1902. He was buried on his estate in the Matoppo Hills, near Buluwayo in Matabeleland.

Rhodes's character was the subject of much diverse criticism. By some he was regarded as preëminently a man of money, actuated entirely by selfish motives, and one who for the attainment of his ends did not scruple to plunge South Africa into war. To those of British inclinations he appeared rather as one of the great builders of empire, a descendant of Clive and Warren Hastings. Rhodes's will, by which he left almost his entire fortune for the purpose of educating the Anglo-Saxon youth to the idea of empire, radically modified previously formed estimates upon his character. See RHODES SCHOLARSHIPS.

Stead, in the *Review of Reviews* (London, May, 1902), gives a remarkable study of the psychology of Rhodes

RHODES, COLOSSUS OF. See COLOSSUS.

RHODES, HELEN. See HARDELOT, GUY D'.

RHODES, JAMES FORD (1848–) An American historian, born in Cleveland, Ohio, May 1, 1848. He was educated at New York University, the University of Chicago, and the Collège de France. In 1867 he was Paris correspondent of the Chicago *Times*. To investigate the iron and steel industries he traveled in Germany and England, and after his return to America he conducted similar investigations in the southern part of the United States. Subsequently, with his father, he was engaged in the coal, iron, and steel business in Cleveland until 1885. In this year he was able to retire and to devote himself to writing a *History of the United States from the Compromise of 1850* (7 vols., 1893–1906), a political narrative and analysis of the events growing out of slavery, the Civil War, and Reconstruction. This work is the most authoritative account of the period which it treats. The author's style, if lacking somewhat in literary grace, is not unattractive, and the content of his writing is characterized by great candor, sincerity, and thoroughness. His treatment of men and measures is marked by an eminent degree of fairness. On occasion he does not hesitate to express very positive views, yet it is to be noted that where a matter is controverted he usually presents both sides. In a marked degree the volumes devoted to the causes of the Civil War are scholarly, impartial, and judicial in treatment, and the exhaustive notes and references found therein are indispensable to the student. Although Rhodes is less attracted by the legal and diplomatic aspects of the War and Reconstruction periods, his scientific analysis of the politics of the two eras, particularly of Reconstruction, is unrivaled. In addition, Rhodes published *Historical Essays* (1909) and *Lectures on the American Civil War*, delivered at Oxford in 1913. He was awarded the Loubat prize of the Berlin Academy of Sciences (1901) and the gold medal of the National Institute of Arts and Letters (1910), became corresponding member of the British Academy and a member of the American Academy of Arts and Letters, and in 1899 served as president of the American Historical Association. Oxford and many American universities gave him honorary degrees.

RHODES, KNIGHTS OF. See SAINT JOHN OF JERUSALEM, KNIGHTS OF.

RHODES, LAW OF. A code apparently drawn up by the Rhodians at the time of their great naval power in the third century B.C., though it is known only from references in Roman law. The code was declared binding by Antonius Pius in so far as it did not conflict with Roman law, but its provisions are not known, except that "if cargo is thrown overboard to lighten a ship, all must contribute to make good the loss incurred for the benefit of all," a doctrine still accepted in maritime law. The extant treatise entitled *Ius Navale Rhodiorum* is a group of mediæval forgeries. See CONSOLATO DEL MARE; OLÉRON, LAWS OF.

RHODES GRASS (*Chloris gayana*). A valuable perennial grass, spreading by surface runners, which is believed to have been brought under cultivation by Hon. Cecil Rhodes on his farm in South Africa about 1895. It is a valuable hay grass and also affords good pasture if properly handled. It was introduced into Australia, from which country it was brought to Hawaii in 1904. It is there considered one of the most drought-resistant grasses, and four or five cuttings for hay are annually obtained from it. Rhodes grass was introduced into the United States in 1903 under the name *Chloris virgata*, but it did not attract much attention for several years. It is now considered one of the most valuable grasses for the more southern States. The seed at present mostly comes from Australia.

RHODESIA, rō-dē'zhi-ȧ *or* -zi-ȧ, NORTHERN. A British African protectorate, under the administration of the British South Africa Company. It is the northernmost division of British South Africa (Map: Congo, F 5). Area, about 291,000 square miles. Formerly it was divided into two provinces, North-Western Rhodesia, or Barotseland, and North-Eastern Rhodesia; these were amalgamated by an order in council effective from Aug. 17, 1911. The country is largely an elevated plateau covered with thin forest; much of it is adapted for agriculture and grazing. Maize, cotton, and tobacco are cultivated, and since 1903 the indigenous rubber has been protected. Gold, copper, zinc, and lead are worked, and coal has been discovered. For railway extension, see the following article. The white population, according to the census of 1911, was 1497; the native population (partly estimated), about 875,000. Livingstone, on the Zambezi, is the administrative headquarters; other centres are Fort Jameson, Abercorn, Fife, Broken Hill Mine, and Lealui, principal residence of Lewanika, paramount chief of the Barotse. Consult Gouldsbury and Sheane, *The Great Plateau of Northern Rhodesia* (London, 1911).

RHODESIA, SOUTHERN. A British South African protectorate under the administration of the British South Africa Company (Map: Congo, F 6). It consists of two provinces, Mashonaland (at the east) and Matabeleland, with a total estimated area of 148,575 square miles

The larger part of the country is an elevated veldt (3000 to 6000 feet), well wooded and studded with granite kopjes. The country is well watered by the tributaries of the Zambezi and the Limpopo and is covered with a luxuriant vegetation. The climate is healthful in the elevated districts, which occupy the larger part of the country, but is malarial and oppressive in the valleys of the Zambezi and the Limpopo. The average maximum and minimum shade temperatures at Salisbury during the year ended June 30, 1912, were 77.5° and 52°; at Buluwayo, 79.3° and 54.4°. The rainfall at the former town was about 21 inches and at the latter about 20 inches. Practically no rain falls from May to September.

The mineral deposits of Southern Rhodesia include gold, coal, copper, silver, iron, antimony, arsenic, and lead. Gold is found principally in the central part of Mashonaland in the valleys of the Umtali and the Imbesi rivers. The gold deposits of Southern Rhodesia show traces of prehistoric workings. During the eight years following the occupation of the country by the South Africa Company in 1890 the gold output was only 6470 ounces, but the yield then increased and up to the end of 1914 amounted to 7,258,055 ounces, valued at £28,862,173. The value of the output in 1914 was £3,580,208. Extensive beds of excellent coal were discovered in 1900 in the Wankie district, near the Zambezi. The output in 1914 was 349,459 tons. Silver produced in 1914 was 150,792 ounces. Copper occurs in the Gwelo, Victoria, and Lomagundi districts; the output in 1914 was 1011 tons. The output of lead in 1914 was 149 tons and of chrome iron ore 48,207 tons. In 1905 diamonds were discovered in the Gwelo district, and, up to the end of 1914, 10,562 carats had been declared.

The soil of Southern Rhodesia is fertile and well adapted for both agriculture and grazing. Considerable tracts are under cultivation, and thoroughbred animals for live-stock improvement are constantly imported. Good crops of European cereals, vegetables, and fruits are raised, and various subtropical plants are successfully cultivated. Kafir corn, maize, and tobacco are produced in considerable quantity, and there has been some success in cotton planting.

The Rhodesian Railway system (including the Beira Railway, 204 miles, in Portuguese East Africa, and the extension in Northern Nigeria) had a total length of 2468 miles in operation at the end of 1914. The "Cape-to-Cairo" line, built north from Buluwayo, was completed to the border of the Belgian Congo in December, 1909. In the Congo the line has been extended to Kambove, which thus has rail communication with Cape Town, 2421 miles distant. Mention must be made of the great bridge, said to be the highest in the world, which carries the railway across the gorge of the Zambezi below the Victoria Falls and which was opened Sept. 12, 1905; it is 650 feet long, 30 feet wide, and about 420 feet above the river. At the end of 1913 the Rhodesian telegraph system comprised 3393 miles of line and 8350 miles of wire, with over 100 offices. At the same date post offices in Southern Rhodesia numbered 98.

The administration of Southern Rhodesia is vested in the British South Africa Company, but there is also a resident Commissioner appointed by the Secretary of State for the Colonies. The Executive Council is composed of not less than three members appointed by the company with the approval of the Secretary of State. The Legislative Council consists of the company's administrator, six nominees of the company approved by the Secretary of State, and 12 members elected by the registered voters. Native affairs are administered by a secretary, who is assisted by a chief native commissioner and 32 district native commissioners, appointed by the secretary.

The white population of Southern Rhodesia at the end of 1914 was estimated at 30,000. The census of May 7, 1911, returned 771,077 inhabitants (406,069 males, 365,008 females), as compared with 503,065 in 1901. In 1911 natives numbered 744,559; whites, 23,606; Asiatics and other colored persons, 2912. The population of Mashonaland included 495,451 natives and 12,631 whites; Matabeleland, 249,108 and 10,975. The chief towns are Salisbury, Hartley, Umtali, Victoria, and Gatooma, in Mashonaland; and Buluwayo, Salukwe, and Gwelo, in Matabeleland. Salisbury, the capital, stands at an altitude of 4880 feet; white population, 3479. Buluwayo (q.v.) is 4469 feet above the sea and 1362 miles from Cape Town.

In the first half of the nineteenth century the territory now known as Southern Rhodesia was held by the Matabeles, who were forced by the Boers to retreat north of the Limpopo. With the discovery of gold in that part of the continent Cecil Rhodes (q.v.) concluded a treaty with Lobengula, under which the latter bound himself not to enter into any agreement with any power without the approval of Great Britain. In 1880 the mining rights over the territory were also secured by Cecil Rhodes for the consideration of a monthly salary of £100 to Lobengula, 1000 rifles, and a large quantity of ammunition. A royal charter was obtained for the British South Africa Company in 1889 An uprising of the Matabeles in 1893 ended in the overthrow of Lobengula. A more serious uprising occurred after the withdrawal of the white police to Bechuanaland in 1896. The rebellion soon spread to Mashonaland, and it was only with the assistance of troops dispatched from Natal and Mafeking that peace was restored in 1897. See ZIMBABWE.

RHODES SCHOLARSHIPS, THE. A number of stipends established under the will of Cecil John Rhodes (q.v.), who died in 1902, bequeathing a large part of his estate in trust for the purpose of maintaining a certain number of British, American, and German students at Oxford University, in the belief that "a good understanding between England, Germany, and the United States will secure the peace of the world, and that educational relations form the strong-

est tie" The founder suggested the following basis for awarding these scholarships: (1) proficiency in literary and scholastic attainments, which was to count three-tenths; (2) success in outdoor sports, two-tenths; (3) qualities of manhood, etc., three-tenths; (4) qualities of leadership, two-tenths. Qualifications second and third were to be decided upon by a vote of the fellow students, first and fourth by the masters of the respective schools where candidates prepare. Examinations when conducted are qualifying, not competitive. The number of scholarships to be thus distributed are as follows: South Africa, 24; Australasia, 21; Canada, 6; Atlantic Islands, 6; West Indies, 3; United States, 96; and Germany, 15. The annual value of the Colonial and American scholarships is £300, tenable for three years. The election of American scholars is spread over three years, scholars being elected from 32 States each year, the election taking place in October. The disposal of the German scholarships is at the pleasure of the Emperor.

In the United States the first qualifying examination, based on the Oxford Responsions, or the first Oxford public examination, was held in 1904 and consisted of Latin, Greek, and elementary mathematics. These examinations were held under the auspices of the State committees designated by the trustees for selecting suitable candidates for the scholarships. In California, Maine, Vermont, and Washington appointments are made by the several chartered universities and colleges in rotation Candidates must be from 20 to 25 years of age and must have attended a recognized institution of higher learning for two years Scholars must be unmarried and citizens of the United States The full number to be maintained at any one time is 189. The average age is about two years above that of the ordinary English public-school boy when he enters the university Consult G. R. Parker, *The Rhodes Scholarships* (London, 1913); L B. Mitchell, *The Rhodes Scholarships* (Albuquerque, N. Mex., 1914).

RHODIAN WOOD. See LIGNUM RHODIUM.

RHODINOL, rō'dī-nōl ($(CH_3)_2C{:}CH.CH_2.CH_2.CH(CH_3)CH_2.CH_2OH$. A compound of carbon, hydrogen, and oxygen belonging to the class of primary alcohols. (See ALCOHOLS.) It is contained in the attar of roses and imparts to it its characteristic odor. Pure rhodinol is a colorless oily liquid that may be distilled without decomposition under reduced pressure. It is used in perfumery. See ATTAR OF ROSES.

RHO'DIUM (Neo-Lat., from Gk. *ῥόδιος*, rose-like, from *ῥόδον*, *rhodon*, rose). A metallic chemical element, discovered by Wollaston in 1804. It occurs with other members of the platinum group of metals and, alloyed with gold, as "rhodium gold," or rhodite, a mineral found in Mexico. Rhodium and iridium together are separated by adding iron to the mother liquors from which platinum has been extracted. The precipitate thus obtained is put through a complicated process which finally yields the double chloride of rhodium and ammonium from which the metal may be readily obtained.

Rhodium (symbol, Rh; atomic weight, 102.9) is a white, hard, malleable metal that fuses at about the same temperature as platinum and absorbs oxygen like that metal. It combines with oxygen to form a monoxide, a sesquioxide, a dioxide, and probably a trioxide. With platinum it forms a valuable alloy which is used in the thermoelectric pyrometer. This alloy contains about 18 per cent of rhodium. Crucibles made of rhodium may be used for the same purposes for which platinum crucibles are still generally used in laboratories.

RHODIUS, APOLLONIUS. See APOLLONIUS RHODIUS.

RHO'DODEN'DRON (Neo-Lat., from Gk. *ῥοδόδενδρον*, *oleander*, from *ῥόδον*, *rhodon*, rose + *δένδρον*, *dendron*, tree). A genus of about 200 trees and shrubs, including *Azalea* (q.v.), of the family Ericaceæ. The species of *Rhododendron* proper as distinguished from *Azalea* have evergreen leaves, and many of them are of great beauty both in foliage and in flower. They vary in size from a few inches in height to trees 50 to 60 feet high and 18 inches in diameter. A few small species are natives of continental Europe and of Siberia, but the greater number are found in temperate North America and in the mountains of India. *Rhododendron maximum*, so designated when the far larger Indian species were unknown, is a common American ornamental shrub or small tree which forms impenetrable thickets in the Alleghany Mountains and is magnificent when in flower. The flowers are large, in umbellate corymbs, varying in color from pale carmine to white spotted with red or yellow. *Rhododendron ponticum*, a very similar species with narrower and more pointed leaves, of the same color on both sides, is a native of western Asia and apparently also of southern Spain. *Rhododendron catawbiense*, a native of the southern Alleghanies, with large lilac-purple flowers, and *Rhododendron arboreum*, a native of Nepal, with very dense heads of large scarlet flowers and leaves 12 to 18 inches long, attaining a height of 30 to 40 feet in its native

RHODODENDRON (*Rhododendron ponticum*).

country, are fine and well-known species; *Rhododendron californicum* and *Rhododendron macrophyllum* are among the most conspicuous species of the Pacific coast region. Most of the extremely numerous varieties common in gardens and shrubberies have been produced by hybridization. In many if not most of the hybrids *Rhododendron catawbiense* enters, and, in

a list published in 1871, 250 named hybrids of this species are mentioned. Since that time the number has undoubtedly greatly increased.

Many splendid species of *Rhododendron* have been discovered in the Himalaya, the Khasia Hills, and other mountainous parts of India, by Hooker and others; and some of them have been introduced into cultivation. An oil obtained from the buds of *Rhododendron ferrugineum* and *Rhododendron. hirsutum* has been used by the inhabitants of the Alps under the name *olio di marmotta*, as a remedy for various ailments. The flowers of *Rhododendron arboreum* are said to be eaten in India, and Europeans make a jelly of them. The wood of some of the larger species is white, hard, and close-grained and has been recommended as a possible substitute for boxwood. The species with deciduous leaves that are generally called azaleas are now listed under *Rhododendron*. Rhododendrons are not of difficult culture, a soil containing plenty of leaf mold and protection from drought and winter scalding being the prime necessities for growing the hardier species in shrubberies and parks. See Colored Plate of AZALEAS AND RHODODENDRONS. Consult William Watson, *Rhododendrons and Azaleas* (New York, 1911).

RHO'DOLITE. A purple-red variety of garnet, found in Macon Co., N. C., and used locally for a gem stone.

RHO'DONITE (from Gk. *ῥόδον, rhodon*, rose). A manganese silicate of the pyroxene group with part of the manganese replaced by iron, calcium, or zinc. Rhodonite crystallizes in the triclinic system, has a vitreous lustre, and is usually brownish red, flesh red, or pink, although sometimes green or yellow. It occurs frequently in association with iron and zinc ores and is found in Sweden, the Harz, the Urals, and in the United States at various localities in Massachusetts and in Sussex Co., N. J., where part of the manganese is replaced by zinc, giving rise to a variety known as *fowlerite*. The massive varieties of this mineral, especially those found in the Ekaterinburg district in the Urals, are used for table tops, etc., while varieties from other places are used to a limited extent as gems.

RHO'DOPHY'CEÆ (Neo-Lat. nom. pl., from Gk. *ῥόδον, rhodon*, rose + *φῦκος, phykos*, seaweed). One of the three great groups of algæ, commonly known as red algæ and including the majority of the marine algæ. They are not so bulky as many of the brown algæ (kelps), but they are much more diversified in form. Among the simplest forms the body is a simple or branching filament, or it may be flat and filmy or ribbon-shaped. The more complex forms show an extreme differentiation of the body into branching stems, leaves, and holdfasts. The species of *Corallina* resemble branching coral on account of the abundant deposit of lime in their cell walls. The general hue of the plants is red or violet, sometimes dark purple or reddish brown, the color being due to the presence of a red pigment (phycoerythrin) that may be separated from the green pigment (probably chlorophyll). One of the chief peculiarities of the group is the absence of any ciliated cells, either swimming spores or gametes, which is a surprising feature in so aquatic a group.

Asexual reproduction is chiefly by means of tetraspores, so named because the sporangium produces four spores, which are nonmotile (Fig. 1). The sexual reproduction is very characteristic, the male organs (antheridia) being very simple and the female organs (procarps) often very complex. The antheridia are single cells which either discharge their protoplasts or become detached and float to the female organ.

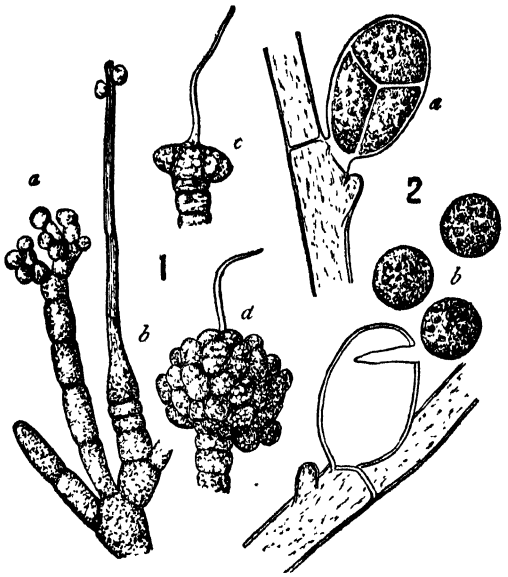

FIG 1. RED ALGÆ.

1, *Nemalion*, sexual branches, showing antheridia (*a*) and carpogonium (*b*) with trichogyne to which two spermatia are attached, beginning of a cystocarp (*c*), and an almost mature cystocarp (*d*). 2, *Callithamnion*, showing sporangium (*a*) and three discharged tetraspores (*b*).

In either event these detached cells are called spermatia. In the simpler forms the female organs consist of two cells, the carpogonium and the trichogyne, the latter being a hairlike cell with which the spermatia come in contact. In the more complex forms there are also "auxiliary cells" which enter into the structure of the procarp. The spermatium or its contents enter the trichogyne and pass into the carpogonium, where the two nuclei fuse. As a result of this fusion a structure is developed (cystocarp, Figs. 1 and 2) which produces spores (carpospores), which in turn produce plants which bear the tetraspores and sex organs. In some forms a distinct alternation of generations (q.v.) is evident. For example, in *Polysiphonia* (Fig. 2) there are three kinds of individuals, resembling one another in vegetative features; but differing in their reproductive organs; the tetrasporic plant bearing only tetraspores, the male plant bearing only antheridia, and the female plant bearing only procarps.

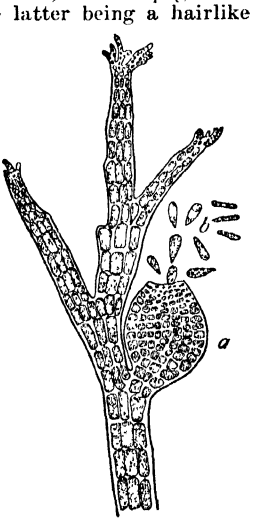

FIG. 2. POLYSIPHONIA.

Showing branching, a cystocarp (*a*), and escaping spores (*b*).

RHODO'PIS (Lat., from Gk. Ῥοδῶπις). A famous Greek courtesan, a native of Thrace. At one time she was a fellow slave of the poet Æsop. Later she was carried to Naucratis in Egypt. There Charaxus, brother of Sappho, fell in love with her and ransomed her at a great price. (See Herodotus, ii. 134–135.) She was attacked by Sappho in a poem.

RHOM'BOID. See PARALLELOGRAM.

RHOM'BUS. See PARALLELOGRAM.

RHONDDA, rŏnd'dà. An important and populous coal-mining district, now a municipality of Glamorganshire, Wales. It is situated amid picturesque valley scenery on the Rhondda River, near Merthyr Tydfil. Pop., 1901, 113,700; 1911, 152,781.

RHONDE, ISLE OF. See GRENADINES.

RHONE, rôn (Fr. *Rhône;* Lat. *Rhodanus*). The principal river of southeastern France. It rises at an altitude of 7550 feet in the Rhone Glacier on the south slope of the Dammastock, a peak of the Urner Alps in south-central Switzerland (Map: France, S., J 3). It flows first in a general southwest course through southern Switzerland and into France as far as Lyons, then due south until it empties into the Gulf of Lyons in the Mediterranean Sea, 25 miles west of Marseilles. Its length is 504 miles. Its upper course is fed by a number of torrents originating in glaciers. It flows through the great valley lying between the Bernese and the Pennine Alps, which forms the Swiss Canton of Valais. At Martigny the valley is narrowed and the river makes a sharp turn to the northwest, becomes then navigable below Saint-Maurice, and enters the eastern end of Lake Geneva after falling 4679 feet in 105.5 miles. Its middle course, Lake Geneva to Lyons, begins as a limpid stream, but soon becomes turbid by the entrance of the Arve. After passing through the Jura Range in a deep and narrow gorge, its width is decreased from 350 to 25 yards. Here it formerly disappeared through a subterranean channel known as the Perte du Rhône, but the rocks which covered it were removed in 1828. After leaving the gorge it becomes again navigable and remains officially so to its mouth. The Saône, the most important tributary, enters the Rhone at Lyons.

Its fall from Lyons to the sea, a distance of 230 miles, is over 530 feet. Its course below Lyons lies in a broad, fertile, and beautiful valley between the Alps and the Cévennes. It receives here two large tributaries, the Isère and the Durance, the latter joining it at Avignon, below which town the river flows through a sandy and arid tract which was formerly a gulf of the sea. Its delta, whose main arms are the Grand and the Petit Rhône, which form the Ile de la Camargue (see BOUCHES-DU-RHÔNE), is growing at the rate of nearly 200 feet annually, owing to the large quantities of sediment carried by the stream. The navigation of the Rhone, owing to the swift current, the shifting of the bed, the numerous islands and the shallow stream, is very difficult even for steamers, and especially on the upstream route. Extensive regulating works have to some extent improved the waterway above the delta, and the shifting and sand-barred mouths of the latter have been obviated by a short canal running from the Gulf of Foz to the main stream, while other canals connect the latter with several ports on the Gulf of Lyons, including Marseilles. See CANALS, *Boat Canals.* Canals also connect the Saône with the Loire, the Seine, and the Rhine.

Consult: Louis Barron, *Les fleuves de la France: Le Rhône* (Paris, 1900); Wood, *In the Valley of the Rhone* (London, 1899); A. Breittmayer, *La Rhône: Sa navigation* (Paris, 1904); R. G. Kingsley, *In the Rhone Country* (New York, 1911). See JEITY.

RHÔNE. A department of southeast France (Map: France, S., J 3) Area, 1104 square miles. It lies almost wholly in the basin of the Rhone and its great affluent the Saône, its eastern boundary being formed by these rivers. The surface is almost entirely mountainous or hilly, the chief level stretches being the valley of the Saône and the district about Lyons. The principal productions are wine and silk. The wines are famous for their excellent quality. About one-tenth of the surface is in vineyards. Silks are manufactured extensively, and numerous other branches of manufacture are actively carried on. Capital, Lyons (q.v.). Pop., 1911, 915,581. Consult C. Lenthéric, *La région du Bas-Rhône* (Paris, 1881), and A. L. Joanne, *Géographie du département du Rhône* (9th ed., ib, 1904).

RHÔNE, BOUCHES-DU-. A department of France. See BOUCHES-DU-RHÔNE.

RHU'BARB (ML. *rhubarbarum, rheubarbarum, reubarbarum, rheum barbarum,* from Gk. *ῥῆον βάρβαρον,* rhubarb, from *ῥῆον, rheon,* rhubarb, and *βάρβαρος, barbaros,* barbarous, foreign), or PIE PLANT (*Rheum*). A large coarse genus of Asiatic herbs of the family Polygonaceæ, closely allied to *Rumex* (dock and sorrel) The rhubarb of commerce, which comes from inland parts of China or Chinese Tartary, is produced by an unknown species.

The leafstalks of rhubarb contain an agreeable mixture of citric and malic acids, and when young and tender are highly esteemed for stewing and preserving, for which purpose the plants are widely cultivated in temperate and cold countries. Several species have been introduced into cultivation for their leafstalks. *Rheum palmatum,* the first species known, and once believed to yield Turkey rhubarb, has roundish green leafstalks and half-palmate leaves. Its stalks are inferior for the table. *Rheum undulatum, Rheum rhaponticum,* and *Rheum hybridum* have broad, heart-shaped, undivided leaves, upon flattened, often reddish leafstalks grooved on the upper side. In some of the finest varieties the flesh is red. In continental Europe rhubarb is grown more as a foliage plant than as a vegetable. Rhubarb is propagated by seed or by dividing the roots. It prefers a light rich soil, which should be heavily manured every year. The plants are placed three or four feet apart, according to the size of the variety. Rhubarb is forced in winter and early spring by having pots or barrels inverted over it, and fresh litter or horse manure heaped around. It is also forced under greenhouse benches and in cellars, the roots being frozen before removal to the heat. As a medicine rhubarb roots are considered to be cathartic, astringent, and tonic. See VEGETABLES.

RHUMB (rŭm) **LINE,** or LOXODROMIC LINE The track of a ship which sails on a constant

compass course. It is a curve on the surface of the terrestrial sphere which has the property of cutting all meridians at the same angle. The rhumb line appears as a straight line on Mercator's projection (see MAP), and it is this property of the projection which makes it so convenient and useful for navigators. See LOXODROME; NAVIGATION; SAILINGS.

RHUS, rŭs. A genus of shrubs and trees. See SUMACH; POISONOUS PLANTS.

RHYL, rēl. A popular tourist and sea-bathing resort in Flintshire, Wales, at the mouth of the Clwyd, 10 miles northwest of Denbigh (Map: Wales, C 3). It has a fine beach, esplanade, promenade pier, aquarium, and winter garden, golf links, etc. Zinc ore is mined in the vicinity. Much municipal activity has been evinced in public improvements to add to the natural attractions. The town owns its waterworks, gas and electric-lighting plants, markets, and cemetery; maintains promenades, marine walks, and recreation grounds; and has installed modern sewage disposal works. Pop., 1901, 8500; 1911, 9005, with a transient summer population of 20,000.

RHYME, or **RIME** (AS., OHG. *rīm*, number, Ger. *Reim*, rhyme). In the broader meaning, a poem, or versified composition, as when we speak of the "Mother Goose Rhymes"; also a synonym for poetry in general. More technically rhyme is the recurrence of the same sound, in a verse or verses, in syllables having corresponding metrical values. Rhymes are of three general types: they may be formed either by the correspondence of the initial sounds of the rhyming syllables, in which case they are called head rhyme or alliteration; or by the correspondence of the vowel element, in which case, if the succeeding consonant sounds differ, we have assonance, while if these consonants are the same in sound, or if there are no consonants, we have true rhymes. Alliteration was the characteristic rhyme of ancient Teutonic poetry, while assonance prevailed in the early Romance literatures. In modern literature both of these types have yielded in large measure to true rhyme, but they have not entirely ceased to be in good form. Often, in modern poetry, they are used in connection with rhyme. Thus, in *The Symphony*, Sidney Lanier combines rhyme and alliteration:

> Woe *him* that cunning trades in *h*earts contrives!
> Base *l*ove good women to base *l*oving drives.
> If men *l*oved *l*arger, *l*arger were our *l*ives;
> And *w*ooed they nobler, *w*on they nobler *w*ives.

And in the same poem rhyme and assonance are combined in:

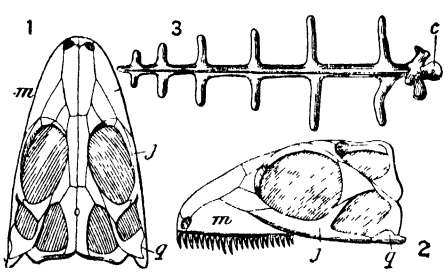
> *Vainly* might Plato's *brain* revolve it;
> *Plainly* the heart of a child could solve it.

The placing of rhyming words in the verse structure varies with the different types of verse composition. Alliteration is characteristically complete in a single verse and in Anglo-Saxon poetry usually consisted of a threefold repetition of the alliterated sound, as in the third and fourth lines of the first quotation above. End rhymes, on the other hand, may be completed within a single verse, but are ordinarily between two or more verses. Not infrequently poems are constructed having both styles of rhyme, as in Shelley's *Cloud:*

> I bring fresh *showers* for the thirsting *flowers*,
> From the seas and the *streams;*
> I bear light *shade* for the leaves when *laid*
> In their noonday *dreams.*

Rhymes, of whatever sort, are in modern poetry always placed upon accented syllables, and end rhymes are characteristically placed either at the end of the verse or at the cæsura, as in the first and third verses here given. They may, however, be placed even at the beginning of the verse, as in the second citation from Lanier's *Symphony*. In complicated structures they are often used with less regard to regularity. In general, however, internal rhymes irregularly placed convey an effect of assonance rather than of true rhyme. As to the relation of rhyming verses, this is determined either by the form of the stanza or in nonstanzaic rhymed composition by some set order, as the couplet. Stanzas are of indefinite variety, and the poet is at liberty to invent forms according to his taste.

Not all languages agree as to the nature of the adequate rhyme. In English, words which rhyme perfectly must agree in all the sound elements succeeding the initial element of the last accented syllable, and in this element they must differ. In French, on the other hand, such a rhyme is only *suffisante*, the *riche* or perfect rhyme having identical *all* the elements in the rhyming syllables. (See *Versification* under FRENCH LANGUAGE:) Thus, *grows* and *rose* form a perfect rhyme in English, *rose* and *arrose* in French. Rarely in English an identical rhyme is used provided the sense be changed (which is also always necessary in French), as *reign* with *rein*, *lo* with *low*, but the change must be more than a mere negation; in no case should *close* and *disclose* be rhymed, nor words having the same root, as *compute*, *dispute*. When a word is repeated to rhyme with itself, as frequently happens in Poe's poems, it has the value of a refrain rather than of a true rhyme, and in all such cases there should be at least one other word rhymed with it. There are a few words in English the pronunciation of which may be altered to suit the needs of rhyme; thus, *wind* (noun) may be rhymed with *blind*, etc., but this is only a form of poetic archaism. As in French, rhymes are masculine and feminine—masculine when the rhymed syllable is also the chief accent of the word, *aver*, *deter; mar*, *tar;* feminine when it is followed by unaccented syllables, *marry*, *tarry; tenderly*, *slenderly*. Sometimes a secondary accent is made to carry the rhyme, but in such cases it is generally rhymed with a word having no great rhetorical stress or having other words rhymed with it. The use of feminine rhymes is not common in English, and they are never to be found in the complicated form to be met with in some other languages. (See RUBAIYAT.) They occur most freely in satirical verse, which often takes great liberties with rhyme. An example from Lowell is:



> Though you brag of your New World, you don't
> half believe in it;
> And as much of the Old as is possible weave in it.

Rhyme was of relatively slight value in verse which depended upon quantity rather than accent and in languages which abounded in elaborate inflections. It was not until the classical Latin gave way to the vulgar speech that rhyme became the rule, first in the early hymns of the Christian Church. Rhyme was elaborately developed among the Persians and Arabs of mediæval times, but its origin is not known.

RHYNCHOCEPHALIA, rĭŋ'kō-sĕ-fā'lĭ-à (Neo-Lat. nom. pl., from Gk. *ῥύγχος*, *rhynchos*, snout + *κεφαλή*, *kephalē*, head). An order of primitive reptiles, represented in modern times by a single survivor, *Sphenodon* or *Hatteria*, which lives on islands off the coast of New Zealand, and in ancient times by a few creatures whose fossil remains are found in Mesozoic and Eocene rocks. This order received its name from the beaklike rostrum on the skulls of some of its typical species. The suborder Proganosauria includes the most primitive forms, in which the teeth are of uniform shape and parts of the skeleton are still cartilaginous. *Palæohatteria* from the Lower Permian of Saxony is the earliest known reptile. It had a lizard-like body about 18 inches long, with a long tail, large head, very large eyes, and numerous large conical teeth that are fused with the jaw bones, and also small teeth on the palate. The legs were strong, and the feet were provided with five clawed toes and adapted to progress on land.

1, skull of *Palæohatteria*, superior aspect; 2, the same, lateral aspect, 3, a dorsal vertebra of *Naosaurus claviger*: c, centrum; j, jugal; m, maxilla; q, quadrate bone.

THE RHYNCHOCEPHALIC SKULL.

Cranium of *Hyperodapedon cordoni* 1, superior aspect; 2, lateral aspect; 3, mandibular symphysis.

A suborder, Pelycosauria, includes several curious though imperfectly known genera in which the anterior teeth are different from the posterior and the dorsal vertebræ are furnished with greatly elongated neural spines.

Allied to the rhynchocephalians and often placed in the group are a number of highly specialized Triassic reptiles, of which the best known is *Hyperodapedon*. They are characterized by more complete ossification of the skeleton, by reduction of the abdominal ribs, and by having uniform marginal teeth.

Consult Von Zittel and Eastman, *Textbook of Paleontology*, vol. ii (New York, 1903).

RHYN'CHONEL'LA (Neo-Lat. nom. pl., from Gk. *ῥύγχος*, *rhynchos*, snout). A genus of brachiopods, scarce but widespread in modern seas, but very abundant anciently, and represented in almost every geological formation from the Ordovician upward. About 600 species have been described, mostly from the Mesozoic rocks, of which the Jurassic and Cretaceous groups are especially prolific. Most of the ancient forms are doubly convex shells with prominent though small ventral beaks, and with surfaces marked by strong, usually angular radial plications, and with a more or less elevated median fold and sinus. The structure of the shell in most genera is nonpunctate, a character by which the species may most readily be distinguished from the closely similar species of Terebratulidæ. Consult Davidson, "Monograph of the Recent Brachiopoda," in *Transactions of the Linnean Society*, vol. iv (London, 1886–88), and Hall and Clarke, *Paleontology of New York*, vol. viii, part ii (Albany, 1894).

RHY'OLITE (from Gk. *ῥύαξ*, *rhyax*, stream, especially of lava, from *ῥεῖν*, *rhein*, to flow + *λίθος*, *lithos*, stone), LIPARITE, NEVADITE. An igneous rock of porphyritic texture and siliceous composition, generally with a crumply banded (rhyolitic) texture, due to the arrangement of its constituent minerals by flowage. Rhyolites are also frequently glassy, vesicular, scoriaceous, or pumiceous. When compact and massive, rhyolites are designated as rhyolite porphyries (formerly called quartz porphyries, and then supposed to be of geological age older than the Tertiary). In chemical composition rhyolites have about the same range as the granites. Varieties rich in oxide of sodium are designated soda rhyolites (pantellerites). Rhyolites are for the most part surface lavas or are intruded in other rocks as dikes or sills. Very extensive areas of rhyolite are found in the Cordilleran mountain system of the Western Hemisphere. Rhyolites when of unusually coarse grain are now designated by the variety name nevadite.

RHYS, rēs, ERNEST (1859–). An English author, editor, and critic, born in London. He was educated at schools in Carmarthen, south Wales, at Bishop Stortford, and at Newcastle-on-Tyne, and became a mining engineer (1877). In 1885 he abandoned this profession for a literary career. In 1887–88 he lectured in the United States. His writings on Welsh subjects are popular in character as contrasted with those of the Celtic scholar Sir John Rhys (q.v.). He edited the "Camelot Series" of popular reprints and translations (65 vols., 1886–91); Dekker's *Plays* for the "Mermaid Series" (1888); *The Lyric Poets* (12 vols., 1894–99); *Literary Pamphlets* (1897); "Everyman's Library" (1906

et seq.); and other works. To various volumes in "Everyman's Library" he contributed valuable introductions, besides serving as general editor of the 600 and more volumes in the series. His writings include: *The Great Cockney Tragedy* (1891); *A London Rose and Other Rhymes* (1894); *Welsh Ballads and Other Poems* (1898); *Frederick Lord Leighton, a biography* (1898, which had been preceded by an earlier study in 1895); two romances, *The Fiddler of Carne*, having a Welsh heroine (1896), and *The Whistling Maid* (1900); *The South Wales Coast* (1911); *Lyric Poetry* (1913); *Romance* (1913); *Rabindranath Tagore* (1915).

RHYS, Sir John (1840–1915). A British Celtic scholar, born in Cardiganshire and educated at Bangor Normal College, Jesus College, Oxford, the Sorbonne, Heidelberg, Leipzig, and Göttingen. He became school inspector for Flint and Denbigh in 1871, fellow of Jesus College in 1881, Hibbert lecturer (1886), and Rhind lecturer on archæology at Edinburgh (1889). In 1877 he had been appointed professor of Celtic at Oxford, and in 1895 he added to his other duties those of principal of Jesus College. Rhys also served on numerous important commissions on education, reforms, and land movements connected with Wales. His best-known works are: *Lectures on Welsh Philology* (1877; 2d ed., 1879); *Celtic Britain* (1882; 2d ed., 1884); *Celtic Heathendom* (1886; 2d ed., 1892); *Studies in the Arthurian Legend* (1891); *Inscriptions and Language of the Northern Picts* (1892); *Rhind Lectures on the Early Ethnology of the British Isles* (1890–91); *Outlines of Manx Phonology* (1894); *Celtic Folk-Lore* (1901); *The Welsh People* (1900; 4th ed., 1909), with D. Brynmor-Jones; *Studies in Early Irish History* (1903); *Celtic Inscriptions of France and Italy* (1906); *Celtic Inscriptions of Gaul and Cisalpine Gaul* (1911–13); *Gleanings in the Italian Field of Celtic Epigraphy* (1914). Professor Rhys also cooperated in the production of several important editions of Welsh texts, and his contributions to Celtic scholarship have been various and important. His studies on folklore, mythology, and religion, although brilliant, have been considered rather bold in conjecture. Professor Rhys was elected a fellow of the British Academy in 1903, was knighted in 1907, and was appointed to the Privy Council in 1911.

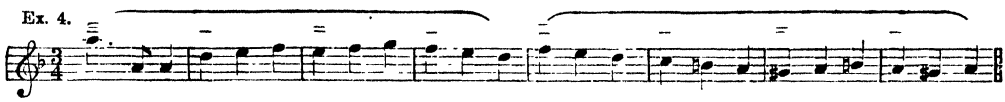
RHYS DAVIDS, Thomas William. See Davids, T. W. Rhys.

RHYTHM (Lat. *rhythmus*, from Gk. *ῥυθμός*, *rhythmos*, rhythm, time, measure, from *ῥεῖν*, *rhein*, Skt. *sru*, to flow). When a succession of discrete auditory, tactual, or visual stimuli is perceived as a succession of groups, we have the perception of rhythm. In this experience the elements so combine that each group appears as a unit, a meaningful whole, much as a series of letters may form a meaningful word. Under analysis the perception of rhythm proves to be a series of sensations which recur at regular intervals and show a regular variation of intensity. Originally the context of the perception (see Perception; Meaning) was doubtless kinæsthetic, and in tactual and visual rhythms kinæsthesis is always present. In auditory rhythms, however, which are more highly developed, kinæsthesis is not invariably observed, and the regular variation of intensity serves of itself to touch off the group meaning. The auditory perception of rhythm is further complicated by two facts: 1. A variation of intensity may be perceived even when the stimuli are uniform in intensity and quality; one hears the ticking of a clock, not as tick, tick, but as *tick*, tick. This "subjective" intensity is a matter of the insistence of certain elements in the stimulus complex; it depends upon a fusion of clearness (see Attention) and some other sensory attribute. 2. An illusion of intensive fluctuation may be set up by change of relative duration, of quality, or of the interval between the recurring stimuli. The subjective reference of these observations has led certain psychologists to regard the rhythmic experience as emotional rather than as perceptive in character. Those who hold this view describe rhythm as a composite feeling, whose components are such partial feelings as strained and fulfilled expectation. The kinæsthesis which accompanies the rhythm is then regarded as a movement expressive of the feeling. See Expression, Expressive Movements.

Rhythm in Music. The regular recurrence of tone groups in which the individual notes are symmetrically arranged according to accent and time value. Rhythm is entirely independent of melody or harmony (qq.v.) and can therefore be indicated by notes without reference to pitch. The following examples illustrate this:

Ex. 1. Polonaise.

Ex. 2 Fandango.



Ex. 3. Beethoven.
(Symphony No. 7.)

In the first example the characteristic rhythmic figure is contained within the limits of a single measure, whereas in the other two examples it fills two measures. It is evident from this that rhythm is not synonymous with accent; for the first beat of every bar has an accent, while in examples 2 and 3, although every bar retains its own accent, there is no special accent or emphasis at the beginning of the rhythmic figure. Accent thus deals with the notes of a single measure; rhythm with groups of notes extending over one or (generally) more measures. Music becomes intelligible only when these larger rhythmic divisions are clearly grasped. A cultivated ear soon tires of constant regularity of rhythm. To avoid monotony, composers resort to various means of breaking the rhythm, such as inserting an odd bar between the regular number of bars composing a rhythmic group, alternating two-bar with three-bar rhythms, or making the weak ending of a phrase coincide with the strong beginning of a new phrase (thus really causing the elision of a bar).

The only simple rhythms are those consisting of a group of notes filling two or three measures (duple and triple rhythm). All rhythms extending over more than three bars are compound. Thus every four-bar rhythm can be resolved into two groups of two bars each. A six-bar rhythm may consist of two groups of three bars each or three groups of two bars each. The Scherzo of

Beethoven's *Ninth Symphony* (see Ex. 4) begins with a theme in quadruple rhythm (two groups of duple rhythm).

Ex. 4.

While every bar retains its own accent (marked —), there is a particular emphasis (marked ≡) upon the first and fifth bars (the beginnings of the rhythmic group) and a less

Ex. 5.

emphasis (marked =) upon the third and sixth bars. The effect produced is the same as if the phrase were written in more moderate tempo as in Ex. 5.

Ex. 6.

After a number of bars Beethoven changes this quadruple to triple rhythm (Ex 6), which produces the effect shown in Ex. 7.

A loose use of language has created a great deal of confusion in regard to the meaning of

Ex. 7.

the term "rhythm." The word is often carelessly employed instead of *accent* or *time*, both of which terms are only subdivisions of rhythm See ACCENT; SYNCOPATION; TIME.

RHYTI'NA. See EXTINCT ANIMALS.

RIAD, rē-äd′, or **RIYAD** (the garden). The Wahabi capital in the Sultanate of Nedjed, central Arabia. It is built on an extensive open plain in a well-cultivated region. In the centre of the city is a large square containing the market place and the great mosque. The city is a resting place for pilgrims on the way from Persia to Mecca and Medina. Riad dates from 1824. Pop. (est.), 30,000.

RIALL, rī′ăl, SIR PHINEAS (1775–1851). A British soldier. He was born in Ireland, entered the British army as an ensign in 1794, and soon rose to be major. In 1804 he was attached to the Fifteenth Foot, served for several years with distinction in the West Indies, and in 1810 was brevetted colonel. Three years later he was promoted major general and was sent to Canada to operate against the forces of the United States. In the following winter he destroyed Black Rock, Buffalo, and other villages on the American border, and during the next summer commanded the troops which opposed the invading army under Gen. Jacob Brown. On July 5 he was defeated in the battle of Chippewa. On July 25 at the battle of Lundy's Lane (q.v.), where he commanded the British forces, he was severely wounded and was taken prisoner. In 1816 he was appointed Governor of Grenada, and administered the affairs of that island for several years. He was promoted lieutenant general in 1825, was knighted in 1833, and was made a full general in 1841. Consult H. J. Morgan, *Sketches of Celebrated Canadians and Persons Connected with Canadian History* (Quebec, 1862).

RIALTO, rē-äl′tō (It., from *rio, rivo,* brook + *alto,* deep, high). The chief bridge of Venice, a graceful structure spanning the Grand Canal by a single marble arch 74 feet in length and 32 feet high. The name is derived from Rivoalto, the island on which Venice was founded. Two rows of shops divide the bridge into a broad road and two narrow side passages. The bridge and adjacent district are referred to in Shakespeare's *Merchant of Venice.*

RIANT, rē′äN′, PAUL EDOUARD DIDIER, COUNT (1836–88). A French scholar and historian, born in Paris. He was known as the foremost scholar of his day on the subject of the Crusades, possessed a keen historical sense, skill in research, and marked scholarship in the interpretation of documents. In 1875 he founded the Société de l'Orient Latin, whose object was the publication of geographical and historical documents appertaining to the Crusades and Palestine. He collected an excellent library for the history of the Crusades, and Scandinavian literature, of which Harvard University obtained the former portion and Yale the latter. Among the numerous volumes written and edited by him are: *Expéditions et pèlerinages des Scandinaves en Terre Sainte au temps des croisades* (1865); *Magistri Thadei Neapolitani Hystoria de Desolacione et Conculcacione Civitatis Accconensis . . . 1291* (1874); *Exuviæ Sacræ Constantinopolitanæ* (2 vols., 1876); *Archives de l'Orient Latin* (2 vols., 1881–84). The *Catalogue de la bibliothèque de feu M. le comte Riant* appeared at Paris in 1896–99 (3 vols.). Consult *Revue de l'Orient Latin,* vol. i (Paris, 1893).

RIANZARES, AUGUSTIN FERNÁNDEZ MUÑOZ, DUKE OF. See MARÍA CHRISTINA (1806–78).

RIAZAN, ryä-zän′y'. A government in central Russia, consisting of 12 districts and bounded by the Government of Vladimir on the north, Tambov on the east and south, and Tula and Moscow on the west (Map: Russia, E 4). Area, 16,261 square miles. It is divided by the valley of the Oka into two parts, of which the northern is low, marshy, and thickly wooded and the southern is slightly elevated, sparsely wooded, and has a rich black soil. Riazan contains deposits of iron, coal, and various clays, of which iron is mined to a considerable extent.

Agriculture, the principal occupation, is greatly hampered by the inadequate size of the peasants' holdings. Rye and oats are the principal cereals raised for export. Stock raising is in a state of decline. The house industry is but little developed, but the manufacturing industries are making considerable progress. The annual value of the manufactures (principally cotton goods and flour) frequently exceeds $11,000,000. Twelve annual fairs greatly promote this government's trade. Pop., 1913, 2,694,800, consisting principally of Great Russians. Riazan was one of the mediæval principalities of Russia and was annexed to Moscow in 1517.

RIAZAN. The capital of the government of the same name in central Russia, near the confluence of the Trubezh with the Oka, 123 miles southeast of Moscow (Map: Russia, E 4). Riazan manufactures candles, tallow, spirits, and metal goods, and has a considerable trade in grain, wood, animals, and salt. It was the capital of the mediæval Principality of Riazan and is the seat of a Greek Catholic archbishop. Pop., 1910, 41,433.

RIAZ PASHA, rē'äz pä-shä' (1836–1911). An Egyptian statesman. When Ismail Pasha became Khedive of Egypt in 1863 he made Riaz one of his ministers. Later he served as vice president of the commission that undertook to straighten out Ismail's financial difficulties to the satisfaction of European creditors. In 1878–79 he was a member of the first Egyptian cabinet. After the deposition of Ismail, Riaz Pasha was Prime Minister of Khedive Tewfik in 1879–81, and in the following year was Minister of the Interior. He again held the premiership from 1888 to 1891, when he resigned after objecting to the appointment of a British judicial adviser to the Khedive. In the following year Riaz accepted the invitation of Abbas II to form a government, but in 1894 he definitely retired on account of ill health. Riaz effected many reforms during his official career, and Lord Cromer in his farewell speech in 1907 praised him highly.

RIB (AS. *ribb*, OHG. *rippi*, Ger. *Rippe;* connected with OChurch Slav. *rebro*, rib, and probably with Ger. *Rebe*, tendril, OHG. *hirnireba*, brain covering, skull). An elastic arch of bone which with its fellows constitutes, with the vertebral column behind and the sternum or breastbone in front, the osseous part of the walls of the chest. In man there are 12 ribs on each side. The first seven are more directly connected through intervening cartilages with the sternum than the remainder, and hence they are termed vertebrosternal or true ribs; while the other five are known as false ribs, and the last two of these, from being quite free at their anterior extremities, are termed floating ribs. The ribs vary considerably both in their direction and size. The upper ribs are nearly horizontal, but the others lie with the anterior extremity lower than the posterior, this obliquity increasing to the ninth rib and then slightly decreasing. They increase in length from the first to the seventh, and then again diminish. The spaces between the ribs are termed the intercostal spaces. On examining a rib taken from about the middle of the series, we find that it presents two extremities (a posterior or vertebral and an anterior or sternal) and an intervening portion, termed the body or shaft. The posterior extremity presents a head, a neck, and a tuberosity, and articulates with the vertebræ. The shaft presents an external convex and an internal concave surface. A little in front of the tubercle the rib is bent inward and upward, the point where this bending takes place being called the

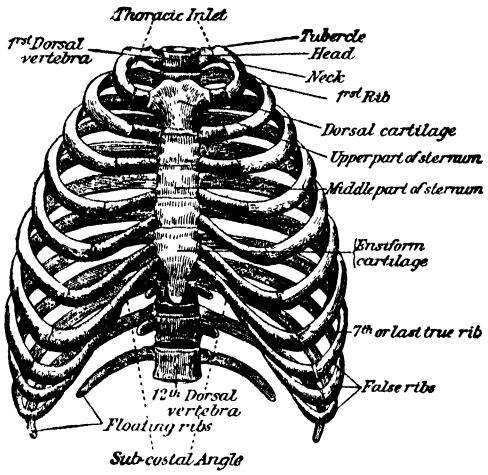


FIG. 1. THORAX, FRONT VIEW.

angle. The upper border of the rib is thick and rounded, while the lower border is marked by a deep groove, which lodges the intercostal vessels and nerve.

The ribs of mammals are mostly connected, as in man, with the bodies of two vertebræ and with the transverse processes of the posterior one. In the Monotremata, however, they articulate with the vertebral bodies only; while in the Cetacea the posterior ribs hang down from the transverse processes alone. Their number on each side corresponds with that of the dorsal vertebræ. The greatest number, 23, occurs in the two-toed sloth, while in the Cheiroptera 11 is the ordinary number. In birds each rib articulates by means of a small head with the body of a single vertebra near its anterior border and with the corresponding transverse process by means of the tubercle. Moreover, each rib pos-

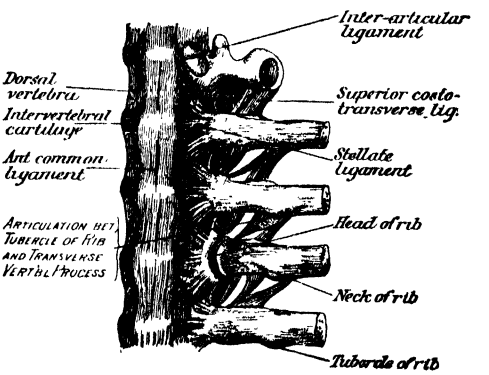

FIG. 2. ARTICULATION OF THE RIBS WITH THE SPINAL COLUMN, FRONT VIEW.

sesses a diverging appendage, which projects backward over the next rib so as to increase the consolidation of the thoracic framework, necessary for flying. The dorsal vertebræ here never exceed 11, and are commonly 7 or 8 in number, and the ribs proceeding from them are connected with the sternum, not by cartilage, as in mam-

mals, but by true osseous sternal ribs, which are regularly articulated at one end with the sternum and at the other with the termination of the spinal ribs. In the chelonian reptiles the ribs (as well as the vertebræ and the sternum) deviate remarkably from the normal type, the lateral parts of the carapace consisting mainly of ankylosed ribs united by dermal plates. In the crocodiles there are only 12 pairs of true or dorsal ribs, while in the other saurians and in the ophidians the ribs are usually very numerous. In the frogs there are no true ribs, the reason probably being that any bony element in their thoracic walls would interfere with the enormous thoracicoabdominal enlargement which these animals periodically undergo at the breeding period. See SKELETON; SPINAL COLUMN.

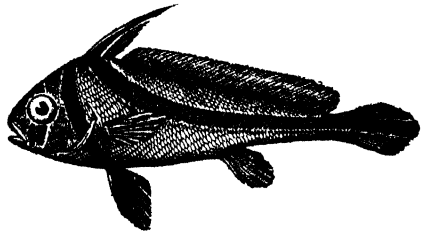
RIB. In general, any one of a series of transverse members of a framed structure. In architecture, a projecting band or molding on an arched or flat ceiling. Ribs were first used in Roman architecture, both to divide the vaulting into bays and to provide a preliminary framework to serve in the construction of the rest of the vault. The dome of Hagia Sophia (532–556 A.D.) is built upon a framework of ribs, but the Byzantine builders only rarely used this form of construction. In mediæval architecture ribs became an essential element of vault construction. (See RIBBED VAULTING.) The Renaissance followed Roman precedents in the main; but the great dome of the cathedral of Florence (1420–64), with its eight huge angle ribs and network of subordinate ribs, blended the Roman and mediæval systems, although the ribs are not visible internally. Modern domes are often built with ribs of metal, covered or filled in with other materials.

RIB, FRACTURE OF THE. The rib may be broken as a result of direct violence such as falls or blows upon the chest or by indirect violence as a result of crushing or squeezing. Severe coughing spells in old people have been known to produce a fracture. Fractures occur in all degrees of severity from mere cracks, which may be overlooked, to compound fractures with laceration of the soft parts and penetration of pleura and lungs by sharp fragments. Where the sharp extremity of a broken rib penetrates the pleura and enters the lung, air escapes into the pleural cavity and into the subcutaneous connective tissue. In the latter event the loose tissues become swollen and puffy and give a crackling sensation when touched. This is surgical emphysema and may extend over a considerable portion of the body. Injury to the lungs and pleura may be followed by abscess or emphysema (q.v.). The treatment for uncomplicated fractures consists in the application of broad strips of adhesive plaster which encircle the injured side from the sternum to the spinal column, thus keeping the fragments in apposition and limiting the respiratory movements.

RIBAUT, rē'bō', or **RIBAULT,** JEAN (c.1520–65). A French navigator and colonizer, born at Dieppe. In 1562 he was given command of an expedition organized by the Huguenot leader, Admiral Coligny, which had for its object the founding of a Huguenot colony in America. With his two vessels he explored the Florida coast, and finally, anchoring at Port Royal, built Fort Charles, near the present Beaufort, S. C. Leaving 26 colonists, he went back to France, from which, on account of the civil wars, he was unable to return for some time. Meanwhile the colony had been abandoned. Another settlement of French Protestants, however, had been made in 1564 under Laudonnière at Fort Caroline, on the St. John's River, and in August of the next year Ribaut came over with seven vessels and assumed command of the colony. The appearance of a Spanish squadron, which had been dispatched with orders to kill all the Protestants in the settlement, drove him to sea. He planned to attack the Spaniards in their new settlement at St. Augustine, but his fleet was wrecked and the project was abandoned. Meanwhile the Spanish leader Menéndez had taken Fort Caroline, on the St. John's River. Over 100 of the garrison were murdered by the Spaniards, as well as others of the French forces who later fell into the hands of Menéndez. Ribaut, traveling towards the settlement, was met by Menéndez, and with most of his party surrendered unconditionally. All but a few were put to death, Ribaut himself meeting his fate bravely. Consult Justin Winsor, *Narrative and Critical History of America*, vol. ii (Boston, 1886), and Francis Parkman, "Pioneers of France in the New World," in *France and England in North America*, part i (ib., 1898).

RIB'BECK, (JOHANN CARL) OTTO (1827–98). A German classical scholar. He was born in Erfurt in Saxony, studied in Berlin under Lachmann, Böckh, and Bopp (1845), and in Bonn under Welcker, the "last Hellene," and with Ritschl (q.v.), whose critical method he closely followed. After receiving his degree in Berlin he went to Italy, where he spent a year. In 1853 he became a member of Böckh's seminar at Berlin, and from 1854 to 1877 taught successively at Elberfeld, Bern, Basel, Kiel, and Heidelberg. He became Ritschl's successor at Leipzig in 1877. Ribbeck's peculiar province was Latin poetry, and his great fame was as a bold textual critic. Besides many contributions to the *Rheinisches Museum*, of which he became an editor in 1876, his more typical works are the valuable collection of Latin comic and tragic fragments (1852–55; enlarged 1871–73; 3d ed., 1897–98); the text of Juvenal (1859), which is very radically reconstructed on the general principles of his essay, *Der echte und unechte Juvenal* (1865), in which Ribbeck held satires 1–9 and 11 to be original and all else of the *textus receptus* to be the result of late additions; the great text of Vergil (1859–62; prolegomena, 1866), based on a minute study of the interrelations and history of the manuscripts, but marred by a subjective and fanciful, if brilliant, criticism, which is also to be found in the Horace of 1869; and an edition of Plautus's *Miles Gloriosus* (1881). But his most valuable works were the *Geschichte der romischen Dichtung* (1889–92; 2d ed., 1897–1900) and the masterly *Life* of Ritschl (1879–81). Mention should also be made of his series of classical character sketches *Alazon* (1882), *Kolax* (1883), and *Agroikos*, and of his collected papers, *Reden und Vortragen* (1899). Consult: C. Wachsmuth, *Worte zum Gedachtniss an Otto Ribbeck* (Leipzig, 1898); Emma Ribbeck, *Otto Ribbeck: ein Bild seines Lebens aus seinen Briefen* (ib., 1901); J. E. Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

RIBBED VAULTING. A form of vaulting in which a framework of ribs forms a sort of skeleton dividing the shell of the vault into compartments which are borne by the ribs. The latter, being first constructed, may be used to



support the centrings for the construction of the compartments or fillings. In some early Romanesque buildings of the eleventh and twelfth centuries in Lombardy, Normandy, and the Rhine provinces, the ribs follow the lines of the groins in quadripartite vaults and are of simple square section. But in the developed Gothic system (thirteenth century and after) the ribs are richly molded, and often decorated with carved rosettes or bosses at their intersections. The French generally retained a simple framework of wall ribs, transverse ribs, and groin ribs, but the English early employed intermediate ribs (tiercerons) to subdivide the compartments, and later added ridge ribs and bridging ribs (see LIERNE RIB), which they later developed into mere decorations. (See FAN VAULTING.) In German and Spanish vaulting purely decorative ribs were also much used after 1300. For the different varieties of ribbed vaulting, see VAULT; see also GOTHIC ARCHITECTURE: GROINED VAULTING.

RIB'BING, SEVED (1845–). A Swedish physician, born in Stockholm. He studied medicine at the University of Upsala (graduating in 1871) and, after a scientific trip through Europe, became hospital physician in Simrishamn in 1872. In the University of Lund he became assistant professor (1879), professor of practical medicine and director of the medical clinic (1888), and rector of the University (1904). Among his writings are: *Öfversigt af pediatrikens utveckling i Sverige* (1878); *Om ileus* (1882); *Om den sexuella hygienen* (1888), his best-known work, which has seen many editions and translations; *Med hvem får man gifta sig enligt halsovårdslarans lagar* (1890); *Våra barns fostran och vård* (1892; 3d ed., 1908); *Terapeutisk receptbandbok* (1894; 3d ed., 1903); *Lifförsäkringslakarens handbok* (1904).

RIBBON. See SILK.

RIBBON (OF. *riban, ruban, rubant*, Fr. *ruban;* perhaps connected with Ir. *ribin*, ribbon, Welsh *rhubin*, streak, Gael. *rib*, hair, rag). In heraldry (q.v.), a diminutive of the ordinary called the bend.

RIBBON FISH. 1. Any of a variety of pelagic fishes characterized by a much elongated and compressed body, especially those of the suborder Tæniostomi, including three families, represented by very few species. They are of very delicate structure, with naked and silvery skin, a long dorsal fin often uniting with the tail fin, a small mouth, and a protractile snout. They are widely distributed from polar to tropical seas, but are nowhere found in abundance, being

GULF RIBBON FISH (*Eques lanceolatus*).

deep-sea fishes and mere occasional visitants of the coasts. Owing to the delicacy of their frame perfect specimens are seldom obtained. Specimens 20 feet long with a depth of 12 inches and a thickness of only an inch or two have been taken. See OARFISH.

2. One of the roncadors (q.v.) of the Gulf of Mexico and West Indies, *Eques lanceolatus*. Its generic name is due to the long dorsal spines, suggesting a rider; and its common name to blackish-brown bands which curiously ornament its yellowish-gray body.

RIBBON GRASS. See CANARY GRASS.

RIB'BONISM. The name given to a movement which originated in Ireland about 1808 and took the form of secret associations of Catholics banded together for the purpose of combating the activity of the Orangemen (q.v.), and known as Ribbon societies. The name was derived from the green ribbon which was the badge of the organization.

RIBBON SNAKE. One of the American garter snakes (*Eutænia saurita*), common from Massachusetts to Louisiana, but rare west of the Alleghanies. It is a light chocolate brown above, with three yellow stripes and greenish below. The only peculiarity in its habits is its fondness for water. Two closely similar species are *Eutænia sackenii* of Florida, which is clear olive with straw-colored stripes, and *Eutænia proxima*, of the Mississippi valley and Texas, which is blackish brown, with dull-yellow stripes. See GARTER SNAKE.

RIBEIRO, rē-bā'ro, BERNARDIM (1482–1552) A Portuguese writer of bucolic prose and verse, who was born at Torrão (Alemtejo) and died in Lisbon. Through family influence he was brought to the attention of King Manoel, who sent him to study law (1506–12) at the University of Lisbon. Upon the completion of his studies the King appointed him his secretary. Both he and his cousin, Joanna Zagalo, because they were not permitted to marry, died insane. Bernardim undertook in 1522 a long journey in Italy, during which he wrote his beautiful pastoral *Saudades*, more often called, from the opening words, *Menina e Moça*, which did not appear until 1554, two years after his death. The best modern edition of the first part of this story is that by José Pessanha (Oporto, 1891). The *Obras de Bernardim Ribeiro* were published at Lisbon in 1645, 1785, and 1852. Consult: Visconde Sanches de Baena, *Bernardim Ribeiro* (Lisbon, 1895); Theophilo Braga, *Bernardim Ribeiro e o Bucolismo* (*Christovam Falcão*) (Oporto, 1897); Carolina Michäelis de Vasconcellos, "Portugiesische Litteratur," in Gröber, *Grundriss der romanischen Philologie*, vol. ii, part ii (Strassburg, 1897); A. F. G. Bell, *Poems from the Portuguese, with the Portuguese Text* (Oxford, 1913); id., *Studies in Portuguese Literature* (ib., 1914).

RIBEIRO-FERREIRA, fâr-rā'ê-rà, THOMÁS ANTONIO (1831–1901). A Portuguese poet and statesman, born at Parada de Gonta and educated for the bar at Coimbra. In 1862 he was elected deputy and in 1881 was made a peer of the realm, entering the Upper Chamber in 1882. In 1870 he became Secretary General of the Portuguese colonies. He received the colonial portfolio in 1878, that of the Interior in 1881, in 1885 and in 1890 was Minister of Public Works, and in 1895 and 1896 served as Minister to Brazil. In prose he wrote for the press and published two volumes of travels, but he was best known as a poet, with a typically Portuguese languor and grace, but much patriotism withal, as in *Dissonancias* (1891). Earlier poems are: *Sons que passam* (1854) and *Vesperas* (1858), both lyric collections; *Don Jaime* (1861; 6th ed., 1880), a national epic; *Delfina do mal* (1868; rev. 1882), a narrative.

RIBERA, rē-bā'rà, JUSEPE DE, called by the Italians LO SPAGNOLETTO (1588–1656). An historical painter and etcher, Spanish by birth and training, but one of the leading masters of the Neapolitan school and the greatest colorist of Italy in the seventeenth century. He was born at Jativa, Province of Valencia, Jan. 12, 1588. First instructed by Ribalta at Valencia, he received most of his training and spent the greater part of his life in Italy. He studied after the works of the great masters in Rome, then especially after Correggio and the Venetians, from whom he derived his vivacity of color. He formed his style, however, chiefly after Caravaggio, of whom he seems to have been an independent follower rather than a direct pupil. After years of vicissitude he settled at Naples, where he secured a patron in the rich picture dealer Cortese, whose daughter he married. Like Caravaggio's pictures Ribera's exhibit a wild, extravagant fancy, but great vigor, and, although imbued with the darkness of shadow masses peculiar to the Neapolitan Tenebrosi (darklings), they show a much finer instinct of the chiaroscuro. He delights in scenes of horror, such as tortures and martyrdoms of all kinds, but occasionally shows also poetic charm, and was the first to combine realism with the Roman Catholic spirit. He painted numerous heads and half figures of hermits, saints, and philosophers with great anatomical exactness. Especially good are his various representations of the "Martyrdom of St. Bartholomew," examples of which are in the museums of Madrid, Berlin, and Dresden. Among his finest paintings are the "Immaculate Conception" (1635), in the convent of the Augustine Recollets at Salamanca, excelling in splendor of color and light and in the charm of the Virgin's figure the representations of this subject by Murillo, Guido Reni, and Rubens; the "Descent from the Cross" (1637), admirable for its delineation of pain, and "Communion of the Apostles," both in San Martino, Naples; the "Adoration of the Shepherds" (1650), in the Louvre; the "Martyrdom of St. Lawrence," in the Vatican; a "Pietà," in the National Gallery, London; "St. Mary of Egypt Praying at her Grave" (1641), in the Dresden Museum, of exceptional charm in form as in color. Of the 50 pictures in the Madrid Museum the best known are: "Jacob's Dream"; "The Immaculate Conception"; "Isaac Blessing Jacob"; "Magdalen"; "St. Rochus"; "Prometheus"; "The Blind Sculptor of Gambazo." Ribera is well represented also in the Academy of San Fernando, Madrid, and in the Escorial. Of singular interest is a half figure of "Homer as Improviser with the Violin," in the Turin Gallery, and his latest work, the "St. Sebastian" (1651), in the Museum of Naples. In New York he is represented by an "Assumption" in the Hispanic Society and by a fine "Lucretia" in the Metropolitan Museum. Of his 26 etchings the best known are "The Drunken Silenus with Satyrs" (1628), the equestrian portrait of "Don Juan d'Austria" (1648), two of "St. Jerome," and "Satyr Scourged by Cupid." Consult: A. L. Mayer, *Jusepe de Ribera* (Berlin, 1907), the best and most complete life; also Lafond, *Ribera et Zurbaran* (Paris, 1902), and C. G. Hartley, *A Record of Spanish Painting* (London, 1904).

RIBHUS, rĭb'ŭz (Skt. *rbhu,* dexterous, from *rabh,* Gk. λαμβάνειν, *lambanein,* to take). In Vedic mythology, a group of three gods who were originally mortals. They are closely associated with Indra and also with Savitar, the sun, while in their appearance they are like the sun and ride in a bright car drawn by fat steeds. They are most frequently mentioned as the artisans of the gods, and accomplish five marvelous feats. Some scholars regard them as the three seasons which are at a standstill during the 12 days of the winter solstice. Consult: Nève, *Essai sur le mythe des Ribhavas* (Paris, 1847); Ryder, *Die Rbhu's im Rgveda* (Gütersloh, 1901); L. D. Barnett, *Antiquities of India* (London, 1913).

RIBOT, rē'bō', ALEXANDER FÉLIX JOSEPH (1842–). A French statesman, born in Saint-Omer (Pas-de-Calais) and educated for the law in Paris. He was one of the founders of the Société de Législation Comparée, was for two years (1875–77) director of criminal affairs in and Secretary of the Department of Justice, and in 1878 was elected a deputy. He became a Moderate Republican, and in his general conservatism was especially prominent as an opponent of Gambetta's radicalism and of the colonial policy of the Ferry cabinet. In 1890 he became Foreign Minister in Freycinet's cabinet, a portfolio which he held also under Loubet. From December, 1892, to March, 1893, he was president of the cabinet. He was active in promoting friendly relations with Russia and England and contributed much to the formation of the Dual Alliance. On Faure's election, in 1895, Ribot was again called to form a cabinet, which, however, lasted for a very short time. In 1905, while accepting the principle of the separation of church and state, he was successful in forcing upon the government important modifications favorable to the Catholic church. Ribot was Minister of Finance in Viviani's second cabinet (formed 1914) and in that of Briand, which succeeded it in October, 1915. In 1906 he was elected to the French Academy. He is the author, among other works, of *Quatre années d'opposition* (1905) and of studies in British political history.

RIBOT, rē'bō', (AUGUSTIN) THÉODULE (1823–91). A French genre, historical, and portrait painter and etcher. He was born at Saint-Nicolas-d'Attez (Eure). After a youth of poverty he went to Paris in 1851, worked for a while under Glaize, and studied Chardin and the great Dutch and Spanish masters in the Louvre. He assimilated something from all of them, yet developed a distinct individuality. In kindred themes he shows almost as great power of expression and mastery of style as Frans Hals and Ribera, but in landscape and marines he lacks the modern conception of light and air. When nearly 40 he began his exhibits at the Salon by a series of still-life pictures and kitchen scenes, painted broadly with strong Rembrandt-like effects of light and shade. These include "Cooks at Dinner Time" (1861) and "Plucking Poultry" (1863). He then turned to religious subjects, which he interpreted with forceful realism. The finest of these, "St. Sebastian," "The Good Samaritan," and "Jesus in the Temple," are in the Luxembourg. His later works were mainly portrait heads, chiefly of old people, which are wonderful studies of wrinkled flesh and intense expression. He was decorated with the Legion of Honor. Ribot also etched about two dozen plates of great strength and distinction. Consult Fourcaud, *Théodule Ribot* (Paris, 1892).

RIBOT, THÉODULE ARMAND (1839–1916). A French psychologist. He was born at Guingamp,

Dec. 18, 1839, and was educated at the Lycée de Saint-Brieure and at the Ecole Normale, Paris, where he received a doctor's degree in 1875. After serving for several years as professor of philosophy at various lycées, he went to Paris and turned to the investigation of experimental and physiological psychology in the histological and physiological laboratories and at the clinics of the insane asylums. In 1876 he founded the *Revue Philosophique*, of which he became the editor. In 1885 he was given charge of a course in experimental psychology at the Sorbonne and in 1888 was called to the chair of experimental and comparative psychology in the Collège de France. Ribot took a leading part in the development of psychology in France, adopting the best methods of both the German and the English psychologists; at the same time his work was characteristically French in breadth of view. Especially valuable are his psychopathological studies and the analytical and comparative treatment of distinctive types or fields of mental phenomena in his later books. His writings, which have seen many editions and the most important of which have been translated into English, include: *La psychologie anglaise contemporaine* (1870); *L'Hérédité psychologique* (1873); *Philosophie de Schopenhauer* (1874); *Psychologie allemande contemporaine* (1879); *Les maladies de la mémoire* (1881); *Les maladies de la volonté* (1883); *Les maladies de la personnalité* (1885); *La psychologie de l'attention* (1889); *Psychologie des sentiments* (1896); *L'Evolution des idées générales* (1897); *Essai sur l'imagination créatrice* (1900); *Essai sur les passions* (1906; 3d ed., 1910); *Problèmes de psychologie affective* (1910); *La vie inconsciente et les mouvements* (1913).

RICARD, JOHN. See RICORD, JOHN.

RICARDO, rĭ-kär'dō, DAVID (1772–1823). An eminent English political economist, born in London. His father, a Jew from Holland, gave him an education in a commercial school in that country. When 14 years of age Ricardo left school to engage in his father's business on the stock exchange, for which he showed remarkable aptitude. At 19 he entered the Church of England and was renounced by his father. Thrown upon the world without resources, he set up as a broker, with such success that he was reckoned a man of wealth by the time he was 25 years of age. It was about this time that he was attracted to the works of Adam Smith, and he began to devote himself to economic studies, though he did not wholly withdraw from business life until 1818. His first publication on economic studies was a pamphlet issued in 1809 and entitled *The High Price of Bullion a Proof of the Depreciation of Bank Notes.* This work created considerable stir and received, as it were, official confirmation in the famous Report of the Bullion Committee in 1811, in the drafting of which Ricardo is reported to have had great influence. A series of pamphlets on financial subjects followed this first venture, and in 1817 appeared his *Principles of Political Economy and Taxation,* on which his fame chiefly rests. In 1819 he entered the House of Commons, and while his diffidence prevented him from becoming a notable speaker, he maintained there a high authority upon all matters pertaining to finance and taxation until his death.

Ricardo exercised a greater influence upon economic thought than any other of the earlier writers except Adam Smith. His writings on taxation are abstract and throw considerable light upon the problems of incidence of taxes. The most complete part of his work is his discussion of currency. His is the first adequate and clear statement of the quantity theory of money. (See MONEY.) The doctrine of comparative costs (see INTERNATIONAL TRADE) is one of his most important discoveries in the realm of international trade. See POLITICAL ECONOMY.

RICASOLI, rē-kä'sō-lē, BETTINO, BARON (1809–80). An Italian statesman, born at Florence. He was a descendant of an ancient Lombard family, studied at Pisa and Florence, and passed the early years of his life on his estate devoted to the study of agriculture, on which subject he wrote a number of useful works. In 1847 he appeared in politics as a leader of the Moderate Liberals and an advocate of Italian unity and was elected mayor of Florence. In 1849 as a member of the executive commission he was instrumental in recalling the Grand Duke Leopold, trusting to the constitutional promises given by the latter. Leopold returned accompanied by the Austrians, and Ricasoli, indignant at this treachery, retired into private life. In 1859 he assumed the leadership of the Liberal movement in Tuscany, and after the flight of the Grand Duke was made Dictator (August 1). In this office he exerted himself for the union of Tuscany with Sardinia, which was brought about in March, 1860. In the same month he was made Governor-General of Tuscany. On the death of Cavour (June, 1861) Ricasoli was called to the head of the ministry. His cabinet, however, could not withstand the Radical assault, and he resigned in March, 1862. He returned to power in June, 1866, and retired in April of the following year, when he was succeeded by Ratazzi. Consult his *Lettere e documenti* (10 vols., Florence, 1888–95) and Ongaro, *Bettino Ricasoli* (Turin, 1861).

RICCATI, rēk-kä'tē, JACOPO FRANCESCO, COUNT (1676–1754). An Italian mathematician, born at Venice. In 1696 he graduated from the University of Padua. Among his contributions to the *Acta Eruditorum* of Leipzig was the famous problem known as Riccati's equation, published in September, 1724. After his death his works were collected and published as the *Opere del conte Jacopo Riccati* (4 vols., 1758; 2d ed., 1765).

RICCI, rĭt'chē, FEDERIGO (1809–77). An Italian dramatic composer, born in Naples. He was educated in music at the Conservatory of San Sebastiano, after which he followed his older brother to Rome. His first great success was won by the opera *La prigione d'Edimburgo* (1837), which was followed by the scarcely less successful *Un duello sotto Richelieu* (1839), *Michelangelo e Rolla* (1841), and *Corrado d'Altamura.* In 1853 he went to St. Petersburg as inspector of the vocal classes in the Theatre School, and about 1870 left that city to superintend personally his own musical productions in Paris. One or two of his operas had been translated and adapted for the French stage, and their success led him to bid for French favor with the more ambitious operas *Docteur Rose* (1872) and *Chi dura vince.* He was disappointed, however, and in 1876 returned to Italy. Additional compositions included masses, cantatas, songs, as well as several other operas. He died at Conegliano.

RICCI, LUIGI (1805–59). An Italian dra-

matic composer. He was born in Naples and, like his brother Federigo, was educated at the Conservatory of San Sebastiano, Naples. He composed several very successful operas which he presented in rapid succession, and in 1836 became maestro di capella at the cathedral of Triest and vocal director of the city theatre. After this much of his work was done in collaboration with his brother until 1859, when he was stricken with disease of the brain and after confinement in the Prague asylum died there. He wrote about 30 operas, of which perhaps *La festa di Piedigrotta* (1852) and *Il diavolo a quattro* (1859), written jointly with his brother, are among the best. His masterpiece, however, was *Crispino e la comare* (1850), one of the best comic operas of Italy and the only one still performed outside of it. Other compositions include masses, sacred and secular songs, and duets.

RICCI, MATTEO (1552–1610). The founder of the Jesuit missions in China and a celebrated astronomer, born at Macerata, Italy. After studying law at Rome he entered the Society of Jesus in 1571. In 1578, while still a scholastic, he went on the mission to India. There he was ordained, and because of his ability in Eastern languages, especially in Chinese, was selected to found the mission in China and proceeded to Macao. After residing in Chow-King, the capital of Canton, and at other places for some years, he resolved to make his way to Peking, and in the dress of a Chinese scholar succeeded in reaching Nanking (1595), but was not allowed to remain long. Later he wrote a series of didactic works in Chinese, one a *Dialogue of Friendship*, in imitation of Cicero, which so pleased the Chinese mandarins that he obtained the permission to go to Peking. He presented to the Emperor a telescope and various astronomical instruments, which were still in the palace when the allies forced an entrance in 1900. After this he was allowed to reside at Nanking. In 1601 he obtained permission to build a church and found a mission in Peking itself. Before long his mathematical teaching and classical Chinese style obtained for him great prestige. He became a special favorite of the Emperor, and through his influence Christianity was introduced into the principal cities of China. There is an important work by him which contains a number of valuable observations on the geography and history of China. Ricci published several works in Chinese which attracted the attention of Chinese literati by the purity of their style. His book *On the Nature of God*, written in Chinese, has been admitted into the number of Chinese classics. Consult biographies by Sainte-Foi (Paris, 1859), Werfer (2d ed., Regensburg, 1870), Natali (Rome, 1900), and De Ursis (ib., 1910).

RICCI, SCIPIONE DE (1741–1810). An Italian bishop, born at Florence. He was ordained a priest in 1766. For some time he was auditor to the Papal Nuncio at Florence, and in 1780 was appointed Bishop of Pistoia and Prato. He attempted to introduce certain reforms in the Church, but though he was supported by the Grand Duke Leopold, brother of Emperor Joseph II and his reform measures were approved by the diocesan Synod of Pistoia in 1786, he was opposed at the general Tuscan Synod, held at Florence in 1787. When Leopold left Tuscany Ricci was forced by the anger of the populace to flee from Pistoia (April, 1790), and he formally renounced his episcopal dignity in June, 1791. In 1794 Pope Pius VI condemned 85 propositions of the Pistoia Synod. Ricci was imprisoned in 1799, but he was released in 1805 by Pius VII after retracting his statements. Consult L. J. A. de Potter, *Vie et mémoires de Ricci* (4 vols., Paris, 1826), and *Memoirs of Ricci*, edited by Thomas Roscoe (2 vols., London, 1829).

RICCI, SEBASTIANO (1660–1734). An Italian decorative painter of the Venetian school, born at Cividale di Belluno. He was a pupil in Venice of Cervelli and worked in various Italian cities. Afterward he visited Austria and England, where he remained 10 years. His works there include the decorations of the chapel at Bulstrode for the Duke of Portland, of the hall at Burlington House, and those in the chapel of Chelsea Hospital. His paintings "The Continence of Scipio" and "The Dinner at Simon's House" are at Hampton Court. Characteristic frescoes are in the Gesuati and other churches in Venice. Ricci was an able decorator, possessing great facility, but also the exaggeration and mannerisms of the baroque.

RICCIARELLI DA VOLTERRA, rīt'chär-ĕl'lē dä vōl-tĕr'rä, DANIELE. See VOLTERRA.

RICCIO, rīt'chō, ANDREA BRIOSCO (c.1470–1532). An Italian sculptor and architect of the Renaissance. In Padua, where he was born, he built the church of Santa Giustina, and for San Antonio in the same city he designed a great bronze paschal candelabrum. In San Fermo, Verona, is another of his masterpieces, the bronze and marble tomb of Girolamo della Torre.

RICCIO, DAVID. See RIZZIO.

RICCIO, rīt'chō, DOMENICO, called BRUSASORCI (1494–1567). An Italian painter of the Veronese school. He was the pupil of Caroto, and was influenced by Titian, Torbido, Parmigiano, and Michelangelo. His importance is chiefly historical; he introduced new and modern methods of composition and of treating color and light. Berenson calls him "the first purely pictorial artist in Italy." His work, however, is unequal and lacks harmony. Most of his works are to be found in his native city. The finest are "Vision of the Madonna," an altarpiece in St. Eufemia; frescoes of landscapes and busts of popes, in the Bishop's Palace; and the historical frescoes depicting the "Coronation Procession of Charles V in Bologna," in the Ridolfi Palace. He is also represented in the Johnson collection, Philadelphia.—Domenico's son FELICE (1540–1605), also called BRUSASORCI, studied under Ligozzi in Florence. A number of his religious paintings are in the Verona churches.

RICCOBONI, rīk'kō-bō'nē, LUIGI (?1674 1753). An Italian actor and dramatist, born at Modena between 1674 and 1677. In 1699 he became director of a company of players, by whose aid he did away with the traditional Italian comedy of masks, and presented the *Pastor fido* and other dramas of importance. Opposition to him at Venice and in the Lombard towns caused him to withdraw to Paris, where from 1716 to 1729 he conducted an Italian theatre in the Hôtel de Bourgogne. He returned thence after a brief residence at Parma (1729–31). His publications include the *Histoire du théâtre italien* (1728–31).

RICCOBONI, MARIE JEANNE LABORAS DE MÉZIÈRES (1714–92). A French novelist, daughter-in-law of Lodovico Riccoboni. She was born in Paris and was at first an actress. She wrote

the once popular novels of society, *Histoire du marquis de Crécy* (1758), *Lettres de milady Catesby* (1759–60), *Ernestine*, etc., and is known for her continuation (1765) of *Marianne*, by Marivaux (q.v.). Her *Œuvres* were published in nine volumes (Paris, 1826), with biographical and critical notices.

RICE (OF. *ris*, Fr. *riz*, from ML. *orysum*, Lat. *oryza*, from Gk. ὄρυζα, *oryza*, ὄρυζον, *oryzon*, rice; connected with Afghan *vrizi*, Skt. *vrihi*, rice). A genus of grasses of which the only important species is the common rice (*Oryza sativa*), one of the most useful and extensively cultivated grains, supplying the principal food of one-half of the human race. It seems to have been originally a native of the East Indies, but has spread to all quarters of the globe, wherever the conditions of warmth and moisture are suitable. It is adapted to subtropical climates rather than tropical or cold temperatures. Rice is an annual, varying from 2 to 5 feet in height. The seed or grain grows on little separate stalks, springing from the main stalk, and the whole appearance of the plant, when the grain is ripe, may be said to be intermediate between that of barley and oats. Rice requires a moist soil, artificially flooded at certain seasons. There are, however, varieties called upland rice that do not require flooding. The cultivation is most extensively carried on in India, China, and other southeastern parts of Asia, Japan, Egypt, the southern countries of Europe, and the South Atlantic and Gulf States, together with Arkansas and California, in the United States. The South Carolina product is of the best on the market. Rice is known in India as paddy—a term also used to designate rice in the husk. See Plate of CEREALS.

In China, where, as in other warm countries, two crops may be obtained in a year, rice is generally sown thickly on very wet land and afterward transplanted to the land which it is finally to occupy. The plants tiller or spread at the root very much, so that each sends up several or many stalks. The rice grounds are carefully weeded, although often so wet that the workmen may sink to their knees.

The origin of the regular production of rice in America is referred to the latter part of the seventeenth century, when a vessel from Madagascar is said to have brought a sack of the grain to Charleston, S. C. This yielded well, the culture spread, and eventually rice became the staple product of that State, until the War of the Rebellion checked it. The mode of cultivation best adapted to the plant in South Carolina has been found to be by irrigation, and it is grown chiefly where the land was formerly overflowed by the tides. The cultivation of rice spread rapidly to most of the Southern States, but of late years Louisiana, Texas, and Arkansas have been the most successful in its cultivation. The prairies of the southern parts of the States have proved to be well suited to the cultivation of rice. The land is irrigated by pumping water from rivers and wells and so regulated as to permit of the use of machinery, as in growing other small grains. The ground is plowed, harrowed, and rolled, and the seed planted with drills. The ground is allowed to dry sufficiently at harvest time to enable the use of binders, and the grain is afterward threshed with machine threshers. It is also grown on lowlands subject to overflow from the river, with due precautions against a possible crevasse. The water is conveyed by ditches and laterals, and i alternately turned on and drained off, as th condition of the plants' progress may demand When the rice is mature the water is drained of and the rice cut and dried. After threshing it i winnowed and placed in sacks, ready for the mil or market. The upland rice is dry-cultivated and is claimed by some planters to be better tha the lowland. It is grown upon high and dr land, but the yield is not so generous as on th low land. The milling of rice consists in remov ing the outer husk or coat. From the threshe the rice is sent to the mills in sacks or in barrels the latter holding 162 pounds each. From thi quantity of rough rice the mills secure 95 pound of clean rice, 8 pounds of polish, 30 pounds o bran, and 29 pounds of waste. The rice polish and rice bran are mixed and sold as a feeding stuff under the name of rice feed or rice meal It is very nutritious.

The production of rice in the United State reaches about 25,000,000 bushels annually. The commercial standard weight of rough rice is 45 pounds per bushel. The principal rice-growing States in decreasing order of production are Louisiana, Texas, Arkansas, California, and South Carolina. In California the first commercial crop was grown in 1912. The 1913 rice crop under the American flag was, Continental United States 715,111,000 pounds, Hawaii 25,800,000, Philippine Islands 1,377,875,000.

The world's recorded production reaches about 100,000,000,000 pounds per annum, of which Asia furnishes approximately 96 per cent, Europe 1 per cent, Africa, South America, and North America 2 per cent. The above figures of 100,000,000,000 pounds do not fully represent world production, as no statistics of the production of China and certain other areas are available. The production in southern China is doubtless large, reports from three provinces placing the product of 1910 at 47,200,000,000 pounds.

Canada rice (*Zizania aquatica*), the wild rice of North America, is a species of another genus of grass quite different from the true rice. It is particularly abundant in the Northwest, growing in miry places or shallow water, often in the margins of lakes. The seeds are about half an inch long, slender, farinaceous, affording very good meal, and used to some extent by the Indians where the plant abounds. Owing to its tendency to scatter its seed its production has not reached any economic importance.

Aside from its use as food (see below) rice is subjected to fermentation in many countries. The beer made from it (sake) is in general use among the Japanese. Several kinds of highly esteemed intoxicating liquors are made from rice by the Chinese. A spirit is also distilled from the lees. Rice starch is made in considerable quantity and is used in laundries and muslin factories. Rice straw is used to make bonnets and also to some extent as a feed for cattle.

Feeding Value. The rice grain is not directly used as a food for farm animals. However, its by-products, chaff meal, bran, and polish, are fed especially in regions where rice is grown. The straw also has a feeding value.

Rice bran and rice meal contain more or less of the germ, and are fed to dairy cows and pigs. According to recent experiments rice meal has practically the same value for pigs as corn meal when fed in addition to skim milk. Rice polish is a fine powder of high nutritive value and is very valuable for cows, pigs, etc. As it is rich in

both nitrogen and potash, it produces a valuable manure. Rice hulls are too woody to be of much food value. They are largely used for packing around breakable articles. Unlike most cereal grains rice is seldom made into bread or cakes, but is eaten boiled. In China, Japan, and other

WILD RICE (*Zizania aquatica*).

countries where the majority of the people cannot obtain animal food, rice, which is rather deficient in protein, is supplemented by special products made from the soy bean (q.v.), which are rich in protein.

Rice flour has the following percentage composition: water, 8.5; protein, 8.6; fat, 6.1; nitrogen-free extract, 51.9; crude fibre, 16.1; ash, 8.8.

RICE, ALICE (CALDWELL) HEGAN (1870–). An American novelist, born at Shelbyville, Ky. Her *Mrs. Wiggs of the Cabbage Patch* (1901) captured the popular fancy with its humanness and its humor and was a great success. The year following its appearance the author married the poet Cale Young Rice (q.v.). In addition to the novel just named she published: *Lovey Mary* (1903); *Sandy* (1905); *Captain June* (1907); *Mr. Opp* (1909); *A Romance of Billy-Goat Hill* (1912); *The Honorable Percival* (1914). Several of these were translated into German, French, Danish, and Swedish, and three (*Mrs. Wiggs, Mr. Opp,* and *The Romance of Billy-Goat Hill*) were dramatized. Both before and after she became a novelist she was favorably known also for short stories contributed to the magazines.

RICE, ALLEN THORNDIKE (1853–89). An American editor, born in Boston, Mass. He graduated at Oxford University in 1875 and in 1876 bought the *North American Review,* of which he subsequently became the editor. In 1879 he promoted the Charnay (q.v.) expedition, which, under the patronage of France and the United States, was sent to investigate the remains of primitive civilization in Central America and Mexico. He was the first to recommend the introduction into the United States of the Australian ballot system. He edited *Reminiscences of Abraham Lincoln* (1886) and was a contributor to *Ancient Cities of the New World* (1887).

RICE, CALE YOUNG (1872–). An American poet and dramatist, born at Dixon, Ky., and educated at Cumberland University and at Harvard (A.B., 1895; A.M., 1896). His verse was published under the titles: *From Dusk to Dusk* (1898); *With Omar* (1900); *Song Surf* (1900); *Nirvana Days* (1908); *Many Gods* (1910); *At the World's Heart* (1914). His plays include: *Charles di Tocca* (1903); *Yolanda of Cypress* (1906); *A Night in Avignon* (1907); *The Immortal Lure* (1911); *Porzia* (1913);—all poetic dramas. In 1915 appeared in two volumes his *Collected Plays and Poems.* For his wife, see RICE, ALICE (CALDWELL) HEGAN.

RICE, DANIEL (1822–1900). An American circus performer, born in New York City. Originally his name was McLaren. He became an acrobat, traveled as a circus clown, and, after winning wide popularity, established a show of his own. He was also very successful financially and devoted considerable sums to charitable and public purposes. During the Civil War he promoted recruiting and subsequently delivered occasional lectures in favor of temperance. He afterward lived in Cincinnati, Ohio, and later in Texas. As a clown probably no other man, except perhaps George L. Fox, won such lasting recognition as did Rice.

RICE, EDWIN WILBUR, JR. (1862–). An American engineer. He was born at La Crosse, Wis., and graduated at the Central High School of Philadelphia in 1880. He then engaged in practice as an electrical engineer, and was superintendent of the Thomson-Houston Electric Company in 1883-88. Becoming connected with the General Electric Company in 1884, he was its technical director until 1894, then vice president until 1913, and thereafter president.

RICE, JAMES (1843–82). An English novelist, born at Northampton. He studied at Queens' College, Cambridge, and was called to the bar at Lincoln's Inn (1871). As editor and proprietor of *Once a Week* from 1868 to 1872 he made the acquaintance of Walter Besant (q.v.), with whom he collaborated on the novels *Ready Money Mortiboy* (1872), successfully dramatized (1874); *The Golden Butterfly* (1876); *The Monks of Thelema* (1877); *The Seamy Side* (1881); etc. Of these perhaps *The Golden Butterfly* and *Ready Money Mortiboy* are the most vigorous. Rice also wrote a gossipy *History of the British Turf* (1879).

RICE, LUTHER (1783–1836). An American clergyman, born at Northboro, Mass. He graduated at Williams College in 1810 and afterward studied theology at Andover Seminary. While at Andover he took part with Adoniram Judson and others in a missionary propaganda which induced Massachusetts evangelical clergymen and philanthropists to found the American Board

of Commissioners for Foreign Missions. (See MISSIONS.) He went to India as a missionary in 1812, and soon after his arrival he left the Congregationalists and joined the Baptist church, as his friend Adoniram Judson had done a few weeks before. He returned to the United States in 1813 and devoted himself to organizing missionary societies and raising funds among the Baptists. Largely through his efforts Columbian University, at Washington, was founded, and for many years he was its treasurer and devoted much energy to its welfare.

RICE, THOMAS D. (1808–60). An American comedian, born in New York City. He was apprenticed to a wood carver, but was attracted to the theatre, where for a time he served as a supernumerary. Soon, however, he turned to negro minstrelsy, in which he became famous in both America and Great Britain. By many he was held to be without equal in his peculiar branch of comic acting. Among his popular performances were the burlesque tragedy *Othello*, the farces *Jumbo Jum* and *The Virginia Mammy*, and *Bone Squash Diavolo*, a travesty on *Fra Diavolo*. Many of his songs, such as "Lucy Long," "Jim Crow," and "Sich a Gittin' Upstairs," held a place among the songs of the people in his day. At the height of his success Rice was noted for his eccentric extravagance, but he died in poverty.

RICE, WILLIAM MARSH (1816–1900). An American millionaire, born in Massachusetts. He accumulated a large fortune in the cotton business in Texas. After his death it was proved that he had been chloroformed by his valet, who had conspired with Albert T. Patrick (q.v.). Practically all of Rice's fortune, estimated at $10,000,000, went to endow Rice Institute (q.v.) at Houston, Tex.

RICE, WILLIAM NORTH (1845–) An American geologist, born at Marblehead, Mass. He graduated at Wesleyan University in 1865 and received the degree of Ph.D. from Yale in 1867. From that year he was professor of geology at Wesleyan, of which university he was acting president in 1907–09. He was also an assistant to the United States Fish Commission in 1873–74, and assistant geologist to the United States Geological Survey in 1891–92. In 1891 he served as president of the American Society of Naturalists. Rice wrote: *Geology of Bermuda* (1884); *Science Teaching in the Schools* (1889); *Twenty-five Years of Scientific Progress and Other Essays* (1894); *Christian Faith in an Age of Science* (1903; 2d ed., 1904); *Manual of the Geology of Connecticut* (1906), with H. E. Gregory; *Problems of American Geology* (1914), with others.

RICE'BIRD'. The name in the Gulf States of the bobolink (q.v.). See JAVA SPARROW.

RICE INSECTS. The rice weevil (*Calandra oryzæ*) is a cosmopolitan insect, which probably originated in India and has been diffused by commerce until it is found in most grain-growing countries. In the southern United States it is known as black weevil. It feeds upon the grain of rice, wheat, corn, barley, rye, oats, and sorghum, and also infests such breadstuffs as crackers and cakes, and is frequently found in flour and meal. It was originally bred from rice, whence its specific name; and it is amenable to the same bisulphide-of-carbon treatment ordinarily applied for other insects injuring stored grain. The rice grub of the southern United States is the larva of a scarabæid beetle (*Chalepus trachypygus*), which looks like the ordinary white grub. It feeds upon the roots of upland rice, but in fields which are frequently overflowed it cannot exist. The so-called water weevil (*Lissorhoptrus simplex*), however, does exist in overflowed fields.

The rice-stalk borer is the larva of a crambid moth (*Chilo plejadellus*). The moth lays its eggs in the early summer upon the rice stalks, and the young larvæ bore into the stalks, working their way gradually towards the roots. It transforms to the pupa stage within the stalk, and after five or six days the moth emerges. It is of a very pale yellowish or straw color, with golden fringes to the front wings, and expands about 1 inch. Stalks inhabited by the borer turn white, and this insect is responsible for a certain amount of the so-called white blast of rice fields. The chinch bug (q.v.) also feeds upon the rice heads, but is seldom abundant enough to do much damage; while in the periods between the overflows the grass worm (larvæ of *Laphygma frugiperda*), when occurring in large numbers, may ravage a field. See GRASS WORM.

Consult *United States Department of Agriculture, Annual Report* (Washington, 1881–82).

RICE INSTITUTE. An institution for higher education founded in 1912 in Houston, Tex. It bears the name of its founder, William Marsh Rice, who on his death left his entire property, valued at about $10,000,000, to the institute. A board of trustees for the foundation of the institute was incorporated as early as 1891, to establish a nonpolitical and nonsectarian institution, to be dedicated to the advancement of letters, science, and art As a nucleus for an endowment fund Mr. Rice at this time gave $200,000 to the board of trustees. During the remainder of his life he increased this fund from time to time. Many years of litigation followed Mr. Rice's death in 1900, and the board of trustees was unable to begin active preparation for the opening of the institution till some time after Edgar Odell Lovett, a professor in Princeton University, was chosen by the trustees as president of the new institute. In 1909 a campus of 300 acres was secured in Houston, 3 miles from the centre of the city, and in 1911 the corner stone of the administration building was laid. This building, the mechanical laboratory, the power house, and the first two wings of the residential hall for men, were ready for occupancy at the beginning of the first academic year. The courses of instruction are for the most part the same as at other colleges of the first rank, special attention being given to the sciences. The degree of A.B. is given for the usual courses. Courses are offered in chemical, electrical, and mechanical engineering. A complete course in any one of these departments will extend over five years. A course of architecture is also given. The institute is coeducational, and there were in all courses, in the autumn of 1915, 384 students. The instructors numbered 40. The endowment is practically $10,000,000. The valuation of grounds and buildings in 1915 was about $1,500,000, and the annual income about $500,000.

RICE LAKE. A city in Barron Co., Wis., about 50 miles (direct) northwest of Eau Claire, on Red Cedar River and on the Chicago and Northwestern and the Minneapolis, St. Paul, and Sault Ste. Marie railroads (Map: Wisconsin, B 3). It has a public library, the county normal school, and five large grade-school buildings.

Lumbering is the chief industry. Rice Lake has adopted the commission form of government. Pop., 1900, 3002; 1910, 3968.

RICH, BARNABE (?1540–1617). An Elizabethan writer. He served in the war with France (1557–58) and thereafter, through most of his life, with the army in Ireland. During his leisure he learned French and Italian and acquired a knowledge of the classics through translations. He claimed to have written 36 books, of which the best known is a series of short stories entitled *Riche his Farewell to Militarie Profession* (1581; reprinted by the Shakespeare Society, London, 1846). From this collection Shakespeare drew the plot of *Twelfth Night*. Afterward Rich issued many romances in the style of the *Euphues*, military reminiscences, and pamphlets against the Papists and tobacco. Consult J. A. A. J. Jusserand, *The English Novel in the Time of Shakespeare;* English translation by E. Lee (New York, 1890).

RICH, CLAUDIUS JAMES (1787–1820). An English traveler and Orientalist, born at Dijon, France, of English parents. He was educated at Bristol, where he showed a remarkable aptitude for Oriental languages. Through friendly influence he received a cadetship in the East India Company service in 1803 and was ordered to proceed via Egypt as secretary to the Consul General to that country, but the vessel in which he traveled was burned in 1804 in the Gulf of Rosas, Spain. He managed to escape, and, after visiting Malta, Italy, Constantinople, Smyrna, and the interior of Asia Minor, everywhere familiarizing himself with the vernaculars, he spent some time in Egypt. Disguised as a Mameluke, he traveled through Palestine and Syria, and, sailing from Basra, reached Bombay in 1807. Four months later (Jan. 22, 1808) he married Governor Mackintosh's daughter and was appointed Resident at Bagdad, where he remained six years. After making a valuable collection of material for a history of the region, in 1811 he visited the site of Babylon, in 1813 sought recuperation from illness at Constantinople, and in 1814 journeyed through the Balkans and visited Vienna and Paris. After his return through Asia Minor to Bagdad, he revisited Babylon, and for his health traveled through Kurdistan in 1820. He definitely established the site of ancient Nineveh (q.v.). He is said to have died of cholera at Shiraz, in Persia, while assisting the sick. His published writings include the *Memoirs on the Ruins of Babylon* (1815; 3d ed., 1818); *Narrative of a Residence in Koordistan* (2 vols., 1836), edited with a biographical sketch by his widow; *Narrative of a Journey to the Site of Babylon in 1811* (1839). His Oriental collection was acquired by the British Museum.

RICH, EDMUND. An archbishop of Canterbury. See EDMUND, SAINT.

RICH, JOHN (1692–1761). An English harlequin and theatrical manager. His father, Christopher Rich, had been a manager of Drury Lane, and after the death of the elder Rich, in 1714, the son opened the new theatre in Lincoln's Inn Fields. It was in 1716 that he introduced the performances in which, under the name of Lun, he himself acted the part of Harlequin (q.v.). Before many years these had developed into the regular English pantomime (q.v.) and had become immensely popular. In 1732 he opened the theatre of Covent Garden, which he continued to manage till his death. Consult John Doran, *Annals of the English Stage from Betterton to Keane* (3 vols., London, 1887).

RICH, PENELOPE, LADY (c.1562–1607). The object of the poetic passion of Sir Philip Sidney's sonnets addressed to Stella. She was a daughter of the first Earl of Essex, who, together with his son Robert, Elizabeth's favorite, received kindly Sidney's offer of marriage. But her guardian, the Earl of Huntingdon, married her, probably in 1581, to Robert, second Baron Rich, apparently against her will. The sonnets in *Astrophel and Stella* (1591), published after this marriage, sneer at the husband's lack of worth and of ability to appreciate her worth—an attitude towards Lord Rich which is taken also by Richard Barnfield, Bartholomew Yonge, and others who wrote poetry to Lady Penelope. But her marital unhappiness did not stop at this stage. In 1595, at the latest, she had formed a liaison with Lord Mountjoy, to whom she bore three sons and two daughters and with whom, after Rich's abandonment of her, which did not occur until after the execution of her brother Robert (1601), she lived openly, even before her divorce in 1605. After her husband's remarriage she married Mountjoy, then Earl of Devonshire, and thus lost her standing at court, where she had been a great favorite.

RICH, ROBERT. See WARWICK, EARL OF.

RICH'ARD I (1157–99), surnamed CŒUR DE LION, or THE LION-HEARTED. King of England from 1189 to 1199. He was the third son of Henry II and his Queen, Eleanor, and was born at Oxford, Sept. 8, 1157. When a mere infant it was decided that he should inherit Aquitaine, and he was betrothed to Alice, or Alicia, the youngest daughter of Louis VII, King of France. Like his brothers, Richard on several occasions rebelled against his father, King Henry II, and was the most prominent figure in the final rebellion, which hastened the death of that monarch. Since the eldest son of Henry II had died, in 1183, Richard succeeded to all the possessions of his father. He had taken the cross in 1187, on the news of the capture of Jerusalem by Saladin. Philip Augustus, King of France, had done likewise, and in 1190 both started on the Third Crusade. Richard, in order to prepare suitably for this Crusade, had borrowed and extorted money wherever possible. The administration of England during his absence was intrusted to William de Longchamp (q.v.), but the prelate was opposed by the King's brother, John Lackland, who gradually usurped the government of the country.

The Crusade proved a failure almost from the start, chiefly on account of the lack of harmony between the two kings. After various delays Richard reached Messina on Sept. 23, 1190. He tarried in Sicily more than half a year and betrothed his nephew Arthur to the infant daughter of King Tancred. The Sicilian throne was at that time claimed by the Emperor Henry VI, and the alliance with Tancred for this reason afterward turned out a very unlucky one for Richard. He fell out with the French King, refused to marry his sister Alice, and on April 10, 1191, sailed from Messina, carrying along with him Berengaria of Navarre, whom he married on May 12, 1191, in the island of Cyprus, where he halted on his way to Palestine. The prodigies of personal valor which he performed in the Holy Land have made the name of Richard the Lion-Hearted famous in romance. After Acre had been captured, on July 12, 1191, Richard exe-

cuted 2700 prisoners of war because the payment of their ransom was delayed. (See CRUSADE.) He quarreled bitterly with Philip Augustus, who went home. After spending months in indecisive contests against Saladin, Richard finally made a truce by which Jerusalem was left in the hands of the Sultan. On Oct. 9, 1192, he set out on his return to England. As he was making his way through the dominions of Leopold, Duke of Austria, he was seized by that prince, who had been insulted by Richard while in the Holy Land, and was handed over to the Emperor Henry VI, who detained him as a captive.

John meanwhile ruled in England, and he and Philip of France had good reasons for wishing that Richard should never return to his kingdom. He was finally released, however, after paying a heavy ransom and agreeing to hold his Kingdom as a fief of the Empire. On March 13, 1194, he found himself once more in England. His brother, John, who had acted so treacherously towards him, he magnanimously forgave, but with Philip Augustus he made war, while he left the actual government to the able administrator Hubert Walter (q.v.). He was on the whole victorious in his war against France, but was killed by an arrow shot from the castle of Chaluz, which he was besieging, and died April 6, 1199. His character has generally been shown by modern historians in a very unfavorable light. Sismondi's words are often quoted: "A bad son, a bad brother, a bad husband, and a bad king." This estimate is somewhat unjust to Richard. He was extremely generous to John; there is no trustworthy evidence that he was a bad husband; as King he chose able ministers and left most of the ruling to them. But he did tax England heavily for his expeditions. He was a poet and well versed in the knightly accomplishments of his age. In the succeeding century he became the hero of many legendary tales, and he has always been viewed in popular literature as a hero of romance.

H. Ramsay, *Angevin Empire* (London, 1903). Sir Walter Scott, in *Ivanhoe* and *The Talisman*, has used some of the best-known legends.

RICHARD II (1367–1400). King of England from 1377 to 1399. He was the second son of Edward the Black Prince and Joan of Kent and was born at Bordeaux on Jan. 6, 1367. Many miraculous stories arose in time concerning his birth, due chiefly to his subsequent unfortunate career. Richard's elder brother died in 1371, and his father in 1376, so that he was placed in the care of his uncle John of Gaunt (q.v.). On June 21, 1377, Edward III died and left to the infant King a country devastated by plague and a people oppressed by heavy taxes due to the war with France (q.v.). Parliament, which had obtained greater power in the last years of Edward III's reign, sought now to secure control of the government, but was opposed by John of Gaunt and his followers. In 1381 took place the Tyler Insurrection (q.v.), which was caused partly by an onerous capitation tax. The speedy suppression of this dangerous rising was due to a considerable extent to Richard's spirit and daring. In 1383 Richard was married to Anne of Bohemia, and in the same year the King began to seek the downfall of the great nobles, who controlled Parliament and prevented the development of the royal power. The next two years were occupied by a war with France, with which country Scotland was allied. For a while Richard conducted the war in Scotland in person, and Edinburgh was burned. In the absence of John of Gaunt in Spain, Richard's youngest uncle, the Duke of Gloucester, put himself at the head of affairs; an attempt which Richard made to free himself from control having been defeated, several of his counselors were put to death, which act was approved by the Parliament of 1388. In 1389, however, Richard by a coup d'état succeeded in throwing off the yoke. Gloucester, Warwick, and Arundel were deprived of their power. These three nobles, together with Henry, Earl of Derby, eldest son of John of Gaunt, and Thomas Mowbray, Earl of Nottingham, had been the nobles who had "appealed" or accused Richard's adherents in 1388. Hence they are known in history as the "lords appellant." In 1394 Richard went to Ireland and received the submission of the four "kings" of Meath, Thomond, Leinster, and Connaught.

The same year the Queen died, and in 1396 a marriage treaty was concluded between Richard and Isabella, infant daughter of King Charles VI of France. Gloucester disapproving of this marriage, which seems to have been unpopular, Richard caused him to be privately arrested and conveyed to Calais, where he either died or was murdered. On the meeting of Parliament the Earl of Warwick was banished and the Earl of Arundel beheaded. A misunderstanding having taken place between Henry, Duke of Hereford (formerly Earl of Derby), and Mowbray, Duke of Norfolk (formerly Earl of Nottingham), the King, desirous to be rid of both, sent the former into banishment for 10 years and the latter for life. But Hereford had been assiduously cultivating the popularity which his cousin had been as assiduously throwing away, and the result became apparent in 1399. On his return in that year from a military expedition in Ireland, Richard found that Bolingbroke (as Hereford was generally known) had in his absence landed in England, that he had placed himself at the head of a formidable army, and that the Duke of York had yielded and gone over to his side. The army which the King had with him in Ireland, also, no sooner landed than it almost entirely passed over to the invader. Meeting the conqueror at Flint Castle, Richard was carried captive in his train to London. On Sept. 30, 1399, he formally resigned his crown. On the following day the resignation was ratified by Parliament, and the crown conferred on Bolingbroke (who had assumed the title of Duke of Lancaster), who was henceforth known as Henry IV (q.v.). By order of the peers Richard was confined secretly in various castles. In the February following his resignation the nation was told that he was dead, and his body, or what was supposed to be it, was brought with much pomp from Pontefract Castle and shown to the people. There were rumors afterward of his being alive and in Scotland. It is probable that he was murdered about Feb. 14, 1400. Richard had ability, but was very extravagant, fond of pleasure, and subject to fits of passion. He had some taste

for literature and was a patron of Gower, Froissart, and Chaucer. His reign is important on account of the development of the Privy Council (q.v.) and the active rôle played by Parliament. Furthermore it was during this reign that the work of Wiclif (q.v.) bore fruit in the rise of the Lollard (q.v.) movement. Consult: H. A. Wallon, *Richard II* (2 vols., Paris, 1864); William Stubbs, *Constitutional History*, vol. ii (6th ed., Oxford, 1897); C. W. C. Oman, *Political History of England*, vol. iv (New York, 1906); K. H. Vickers, *England in the Later Middle Ages* (ib., 1914).

RICHARD III (1452–85). King of England from 1483 to 1485. He was the youngest son of Richard, Duke of York, and was born at Fotheringay Castle on Oct. 2, 1452. His boyhood was passed amid the struggles of the Wars of the Roses, in which he experienced both imprisonment and exile. In 1461, after the accession of his brother Edward IV to the throne, he was made Duke of Gloucester, although but a lad of nine years, and throughout the Wars of the Roses he remained faithful to his brother, rendering him most valuable assistance. He rejected the overtures of Warwick and shared Edward's exile in 1470–71, and in the latter year he commanded the vanguard of the Yorkist's army at the final victories of Barnet and Tewkesbury. For all these services he was richly rewarded. In 1469 he was made High Constable of England and in 1478 Great Chamberlain, besides receiving numerous other grants and offices. He stood highest in the royal councils, proving a capable statesman, and in 1480–82 he conducted successful campaigns against the Scots, and as Warden of the West Marches he brought that country into such subjection that the Parliament of 1483 granted this office to him and his heirs forever.

Upon his death in the same year Edward IV left to Richard the care of his heir, Edward V, then but 13 years old, and the administration of his kingdom. Richard was at the time in the north, but before his arrival at London he was recognized by the royal council as Protector of the realm. He soon overthrew the unpopular party of the Woodvilles, the Queen's relatives, who aimed to control the government, and finally imprisoned Edward V and his younger brother. Parliament thereupon declared that he was the rightful King, on the ground that Edward IV's marriage with Elizabeth Woodville was illegal. A deputation of lords and commons presented these conclusions to Richard, who assumed the crown on June 26, 1483. After his accession the King courted popularity with considerable success. He made a royal progress through the midland and northern counties and was everywhere received with joy and loyalty. While Richard was thus engaged in the north, plots for the rescue of the captive princes were being hatched in the south. To end these conspiracies Richard about this time probably had his prisoners put to death, and the popular belief that he was responsible for their death cost him his crown and his life. The Duke of Buckingham, who was involved in these plots, thereupon planned a rebellion in favor of the Earl of Richmond, the Lancastrian claimant of the throne. A general uprising was planned for October 18, which was to extend throughout southern England and Wales, but the King's adherents repressed the insurrection in the south and cut the bridges over the Severn. The heavy autumn rains prevented Buckingham from crossing the river from the Welsh side, and the same storms frustrated the intended invasion by Richmond. Buckingham was taken prisoner and executed.

The remainder of Richard's brief reign was spent in preparations for the final struggle with Lancaster. By wise laws and politic acts he sought to win the affections of the people and by extensive military preparations to baffle the expected invasion. In order to unite the Yorkist party Richard intended to marry his son and heir to Elizabeth, the eldest daughter of Edward IV, and on the death of his son he proposed marrying her (his niece) himself, but was obliged to renounce this plan on account of popular opposition. On Aug. 7, 1485, the Earl of Richmond landed at Milford Haven and was joined by the Welsh chieftains in his advance on Shrewsbury. Richard hastened to meet him, and the hostile armies faced each other on Bosworth Field. When, however, Richard ordered the attack, he found his troops half-hearted, and the Stanleys, whom he had summoned to his aid from Lancashire, joined the enemy. The result was that Richard was defeated and slain (Aug. 22, 1485), and the Earl of Richmond became King of England as Henry VII.

There has been much discussion over the character of Richard III. The chroniclers of the following reign, from whom we have derived our knowledge of him, wrote to please the Tudors. They pictured him as a monster, both physically and morally, and the genius of Shakespeare has fixed this conception in the public mind. He is said to have been undersized and a hunchback, with his left shoulder lower than the right. His look was said by Polydore Vergil to be full of malice and deceit and by Sir Thomas More to be warlike and hard-favored. But contemporary portraits, of which several survive, show a thoughtful, anxious face and no trace of deformity. A hunchback could not have performed the feats of valor which he accomplished at Barnet, Tewkesbury, and Bosworth. But of his unscrupulous character there can be no doubt, although many of the accusations of his enemies are unfounded. He and his brother Clarence were said to have caused the death of Edward, the heir of the house of Lancaster, after the battle of Tewkesbury. But even if this be true there were many similar executions in the Wars of the Roses. There is nothing to prove that he caused the murder of Henry VI or had any part in the accusation and conviction of his brother Clarence. From all these deaths Edward IV, and not Richard, was chief beneficiary. The murder of his two nephews in the Tower was, however, quite generally ascribed to Richard's orders.

Bibliography. Important source material is to be found in Polydore Vergil, *Anglicæ Historiæ Libri XXVI* (Basel, 1534; Leyden, 1861); Sir Thomas More, *History of King Richard III* (Cambridge, 1833); and *Letters and Papers of the Reigns of Richard III and Henry VII*, edited by James Gairdner in the "Rolls Series" (London, 1861–63). The best modern account of his reign is by James Gairdner, *Life and Reign of Richard III* (Cambridge, 1898). For a defense of Richard's character, and especially from the charge of murdering the princes, see Sir C. R. Markham, *Richard III: His Life and Character* (London, 1906).

RICHARD II. An historical tragedy by Shakespeare, written probably in 1595 and en-

tered on the *Stationers' Register* in 1597. Excepting the adapted plays on Henry VI, it is the earliest of the historical plays and the first printed. It was probably the play acted the night before Essex's rebellion in 1601. The suggestive deposition scene made it unpopular at court, and it was suppressed by the censorship, being first printed in the Fourth Quarto in 1608. Several older plays on Richard II had been written, but were not used by Shakespeare. The chief source of the tragedy was Holinshed's *Chronicle*, and its model was Marlowe's *Edward II.* Among the historical plays it stands as a prologue to the dramas of Henry IV and V.

RICHARD III. An historical tragedy by Shakespeare, written about 1595 and entered in the *Stationers' Register* in 1597, shortly after *Richard II.* An older play, *The True Tragedy of Richard III*, was published in 1594, but from this Shakespeare took only two lines. He followed the *Chronicle* (1577) of Holinshed, who took the sombre picture of Richard from Sir Thomas More's *History of Richard III.* Traces of a weaker hand can be detected, and it is supposed that Marlowe helped in the early part of the play, which was finished and later revised by Shakespeare. Historically it follows closely on Henry VI and completes the series dealing with the Wars of the Roses.

RICHARD, Earl of Cornwall (1209–72). King of the Romans (of Germany) from 1257 to 1272. He was the second son of King John of England by Isabella of Angoulême. In 1225 he was created Earl of Cornwall by his brother Henry III. In the same year he led a successful expedition into Gascony. In 1240 he went on a crusade, but accomplished little because hindered by lack of support from the military orders. He received many grants from the King at various times, and amassed enormous wealth, mainly through the possession of the tin mines of Cornwall, which gave him great power in political matters. In 1253 and 1254 he was Regent of England. (See Henry III.) In 1257 Richard was elected by some of the German princes King of Germany, Alfonso X of Castile (q.v.) being elected by a rival party. Richard was crowned at Aix-la-Chapelle. He gradually won recognition throughout the Rhineland, but not elsewhere. In 1259 he was forced to return home to raise money, and took an oath to observe the Provisions of Oxford (q.v.). In the great struggle which took place between Henry III and his nobles, Richard at first acted the part of a mediator; subsequently, however, he took a decided part with his brother against the party which was headed by Simon de Montfort, and on May 14, 1264, he was taken prisoner by that leader at the battle of Lewes. Montfort shut him up in Kenilworth Castle, from which he was released after the battle of Evesham in 1265. The murder of his eldest son, Henry of Almaine, by the son of Simon de Montfort, hastened his death (April 2, 1272).

W. C. Davis, *England under the Normans and Angevins* (New York, 1905); T. F. Tout, *History of England, 1216–1377* (id., 1905).

RICHARD, rē'shär', François Marie Benjamin, Cardinal (1819–1908). A French Roman Catholic prelate, born at Nantes. He was educated at Saint-Sulpice, was ordained a priest in 1844, served as vicar-general of the diocese of Nantes in 1850–70, was consecrated Bishop of Belley in 1872, was made Coadjutor Bishop of Paris in 1875, became Archbishop of Paris in 1886, and received the cardinal's hat in 1889. He opposed the Church and State Separation Law of 1906, and he was nearly 90 when his archiepiscopal palace was claimed by the government. Cardinal Richard did his utmost to check the Modernist movement.

RICH'ARD, Henry (1812–88). A Welsh politician and peace advocate. He studied at Highbury College, and from 1835 to 1850 was a Congregational minister in London. From 1848 to 1885 he was secretary of the Peace Society, and his efforts in behalf of the principle of arbitration earned him the name of the Apostle of Peace. After 1868 he was a member of Parliament for the Merthyr boroughs. There he was instrumental in bringing about election reforms and in carrying through a motion in favor of international arbitration in 1873. His publications include: *Defensive War* (1846; 2d ed., 1890); *The Kagosima Incident and our Intercourse with Japan* (1863; 2d ed., 1863); *Memoirs of Joseph Sturge* (1864); *Letters on the Social and Political Condition of the Principality of Wales* (1866; 2d ed., 1884); *The Recent Progress of International Arbitration* (1884).

RICHARD DE BU'RY. See Bury, Richard de.

RICHARD OF CIRENCESTER (?1335–?1401). An early English chronicler. Little is known of his life. He was probably born about 1335, and in 1355 was a monk in the Benedictine monastery of St. Peter's, Westminster, where he spent his life, and died in 1400 or 1401. He devoted himself to the study of early British and Anglo-Saxon history and antiquities, and is said to have visited many libraries and ecclesiastical establishments in England in the prosecution of his investigations. In 1391 he obtained a license from his abbot to make a pilgrimage to Jerusalem. Richard's principal work is the *Speculum Historiale de Gestis Regum Angliæ*, in four books, covering the period 447–1066. It is a compilation and not very carefully done. Consult the edition from the copy in the public library, Cambridge, by Mayer in the *Rolls Series* (2 vols., London, 1863–69). A treatise on the ancient state of Great Britain, *Ricardus Corinensis de Situ Britanniæ* (Copenhagen, 1757), was long accepted as a genuine work of Richard, but is now conceded to have been a forgery by Charles Bertram (1723–65).

RICHARD OF SAINT VICTOR (?–?1173). A scholastic and mystical theologian, born in Scotland. He entered the cloister of the Augustinian canons of Saint-Victor, near Paris, under its first abbot, who died in 1155. There he was a pupil of the mystic Hugo of Saint-Victor (q.v.), and rose to be prior in 1162. His numerous writings, collected in Migne, *Patrologia Latina*, cxcvi, may be divided into exegetical (in which he follows the allegorical and mystical interpretation), dogmatic, and miscellaneous. In the second the masterpiece is the six books on the Trinity; in the third appear his letters. Consult: Kaulich, *Die Lehren des Hugo und Richard von Saint Victor* (Prague, 1864); J. B. Hauréau, *Histoire de la philosophie scholastique*

(Paris, 1872–80); and the literature under MYSTICISM.

RICHARDS, ELLEN HENRIETTA (SWALLOW) (1842–1911). An American sanitary chemist, born at Dunstable, Mass. She graduated at Vassar in 1870 and then studied for three years at Massachusetts Institute of Technology, where from 1876 till her death she was an instructor, first in the woman's laboratory and after 1884 in the department of sanitary chemistry. At the same time she held various positions as chemist. She made special researches in oils, relative to spontaneous combustion and explosion. In 1875 she had married Robert Hallowell Richards (q.v.). Mrs. Richards wrote: *Chemistry of Cooking and Cleaning* (1882); *Food Materials and their Adulterations* (1886); *The Cost of Living* (1899); *Air, Water, and Food* (1900); *The Art of Right Living* (1905); *Sanitation in Daily Life* (1907); *Euthenics, the Science of Controllable Environment* (1910). Some of these went through several editions.

RICHARDS, HERBERT MAULE (1871–). An American botanist, brother of Theodore William Richards. Born at Germantown, Pa., he was educated at Harvard (S.B., 1891; S.D., 1895), studied at Leipzig in 1895–96, and traveled in China, Japan, Straits Settlements, and Malay Archipelago in 1899–1900. He served as an instructor at Radcliffe College in 1892–95 and 1897–98 and also at Harvard in 1897–98, and at Barnard College was tutor (1896–97), instructor (1898–1902), adjunct professor (1902–06), and professor of botany thereafter. Richards became associate editor of the *Bulletin* of the Torrey Botanical Club, of the *American Naturalist*, and of *Physiological Researches*. His investigations deal largely with the structure and development of algæ and fungi and with plant reactions.

RICHARDS, JOHN MORGAN (1841–). A business man and writer, born at Aurora, N. Y., but for most of his life a resident of England. He was engaged in various commercial enterprises in the United States until 1867, when he removed to London, becoming chairman of John Morgan Richards and Sons, Limited. From 1888 to 1905 he was the owner of the London *Academy*. His books are: *With John Bull and Jonathan* (2d ed., 1905); *Sixty Years of an American's Life in England and the United States* (1905); *Life and Letters of Mrs. Craigie* (*John Oliver Hobbes*) (1911).

RICHARDS, JOSEPH WILLIAM (1864–). An American metallurgist, born at Oldbury, England. He graduated at Lehigh University in 1886, returned there, after courses in Heidelberg and Freiburg, as assistant professor of mineralogy and metallurgy; and became professor there in 1903. He was a member of the United States Assay Commission (1897) and became a prominent legal expert in chemical and metallurgical cases. In 1902–03 he served as the first president of the American Electrochemical Society. After 1907 he added to his duties at Lehigh those of professor of electrochemistry at the Franklin Institute. In 1915 he was appointed a member of the new United States Naval Advisory Board. He wrote *Aluminum* (1887; 3d ed., 1896); *Metallurgical Calculations* (3 vols., 1906–08); and translated from the Italian Federigo Giolitti's *Cementation of Iron and Steel* (1915).

RICHARDS, LAURA ELIZABETH (1850–). An American author, daughter of Samuel Gridley and Julia Ward Howe and sister of Henry Marion Howe (qq.v.). She was born in Boston and was married to Henry Richards in 1871. Her many writings, consisting largely of stories, juvenile and other, include: *Sketches and Scraps* (1881); *Captain January* (1890; 150th thousand, 1902); *Melody* (1893; 64th thousand, 1898); *When I was your Age* (1893); *Snow White* (1900); *The Merryweathers* (1904); *Letters and Journals of Samuel Gridley Howe* (2 vols., 1906–09); *The Wooing of Calvin Parks* (1908); *Florence Nightingale* (1909); *Aboard the Mary Sands* (1911); a volume on her father and mother, *Two Noble Lives* (1911); *The Little Master* (1913); *Three Minute Stories* (1914). In 1915 Mrs. Richards and her younger sister, Maud Howe Elliott, published *Julia Ward Howe*.

RICHARDS, ROBERT HALLOWELL (1844–). An American mining engineer, metallurgist, and educator, born at Gardiner, Me. In 1868, with the first class to leave the institution, he graduated from the Massachusetts Institute of Technology, and there he taught for 46 years, becoming professor of mineralogy and assaying in 1871, head of the department of mining engineering in 1873, and in 1884 professor also of metallurgy. He retired in 1914. The laboratories which he established at the Institute were the first of their kind in the world. Professor Richards invented a jet aspirator for chemical and physical laboratories and a prism for stadia surveying. But it was in the field of ore dressing that he became especially distinguished. He determined the curves of material settling in water, thereby establishing the fundamental principles of sorting ore by means of jigs and other machines. He invented separators for Lake Superior copper, Virginia iron, and three for ores of the western United States. Richards served as president of the American Institute of Mining Engineers in 1886. He is author of more than 100 monographs or articles, but his most notable work is a monumental treatise, *Ore Dressing* (4 vols., 1903–09). He published also *A Text Book of Ore Dressing* (1909). His wife was ELLEN HENRIETTA RICHARDS (q.v.).

RICHARDS, THEODORE WILLIAM (1868–). An American chemist, born in Germantown, Pa., a son of William Trost Richards. He was educated at Haverford College and at Harvard (A.B., 1886; Ph.D., 1888). After further study, with Nernst at Göttingen, with Ostwald at Leipzig, and at the Technical School in Dresden, he returned to Harvard, where he served as assistant professor of chemistry from 1894 to 1901 and thereafter as professor; he was also chairman of the chemical department in 1903–11 and director of the Wolcott Gibbs Memorial Laboratory after 1912. Richards redetermined with great precision the atomic weights of many of the chemical elements, measured the compressibilities of a number of elements and compounds, and rendered valuable experimental services in thermometry and especially in calorimetry. Among many high honors which came to him were the Nobel prize in chemistry for 1914 (in recognition of his work in atomic weights); the Davy medal of the Royal Society; a medal from the British Chemical Society (before which he was Faraday lecturer in 1911); the Willard Gibbs medal of the American Chemical Society and the presidency of this body in 1914–15; his selection as exchange professor

to Berlin in 1907; and election to the National Academy of Sciences. He also received numerous honorary degrees from American universities, and abroad from Oxford, Cambridge, Manchester, Berlin, Prague (Royal Bohemian), and Christiania. Consult J. Koppel, *Experimentelle Untersuchungen über Atomgewichte von Theodore William Richards* (Leipzig, 1909).

RICHARDS, THOMAS ADDISON (1820–1900). An American landscape painter and illustrator, born in London. He came to the United States in 1831 with his parents and settled in Georgia, but removed to New York City in 1845, where he studied at the National Academy of Design. In 1858 he was made director of the Cooper Union School of Design for Women, and in 1867 became professor of art in the University of New York. He was elected a National Academician in 1851. Richards belonged to the Hudson River school. He is best known, however, for his landscape illustrations drawn on wood, the first of the kind in America. Among the works on travel and art for which he supplied text and drawings are: *Georgia Illustrated* (1842); *The Romance of American Landscape* (1854); *Pictures and Painters* (1870).

RICHARDS, WILLIAM (1792–1847). An American missionary. He was born at Plainfield, Mass., graduated at Williams College in 1819, and at the Theological Seminary at Andover in 1822. In the same year he was sent as a missionary to the Sandwich Islands, and by the close of 1830 the native church numbered nearly 300 communicants. In 1838 Mr. Richards was released from mission work to become interpreter, translator, and chaplain to the King. He visited England and several other foreign courts as special ambassador to secure the acknowledgment of the independence of the islands. After his return in 1845 he became Minister of Public Instruction, having care of all schools, Catholic and Protestant, and occupying a seat in the King's Privy Council. Consult Sprague, *Annals of the American Pulpit* (New York, 1866).

RICHARDS, SIR WILLIAM BUELL (1815–89). A Canadian jurist. He was born in Brockville, Ontario, where he practiced law, after being called to the bar in 1837. He was elected a Reform (Liberal) member of the Canada Legislative Assembly in 1848 and was Attorney-General in the Hincks-Morin ministry from 1851 till 1853, when he was appointed a puisne judge of the Court of Common Pleas in Upper Canada. He was Chief Justice of that court in 1863–68, Chief Justice of Upper Canada in 1868–75, and first Chief Justice of the Supreme Court of Canada from its foundation in 1875 until his retirement in 1879. He was knighted in 1878.

RICHARDS, WILLIAM TROST (1833–1905). An American landscape and marine painter, born in Philadelphia. He was a pupil of Weber in his native city, and afterward traveled and studied in Europe. He exhibited at the Royal Academy and the Salon and became an honorary member of the Academy of Design. Richards tried to introduce Pre-Raphaelite principles into American art, and his early landscapes are marred by too great insistence on detail. The marines, which he painted later, while equally accurate, are more harmonious and better constructed. His works include: "On the Coast of New Jersey" (1883), in the Corcoran Gallery, Washington; "The Bell Buoy," in the Pennsylvania Academy; "A Rocky Coast"; and 85 other water colors, in the Metropolitan Museum, New York.

RICH'ARDSON, SIR BENJAMIN WARD (1828–96). A British physician. He was born at Somerby, Leicestershire, and studied at Glasgow, receiving the degree of M.D. in 1854 at St. Andrews. After establishing himself in London he held several hospital positions and served on the staff of the College of Physicians. He was knighted in 1893. The *Journal of Public Health and Sanitary Review* was founded by him in 1862 and the *Asclepiad* (of which he was editor until his death) in 1885. Richardson contributed many articles to medical literature, especially on the subjects of hygiene, temperance, and the history of medicine. Among his works are: *Hygienic Treatment of Pulmonary Consumption* (1857); *The Cause of the Coagulation of the Blood* (1858), Astley Cooper prize essay; *On the Medical History and Treatment of Teeth* (1860); *For and Against Tobacco* (1865); *Health and Life* (1880); *The Field of Disease* (1883); *The Health of Nations* (1887); *Vita Medica* (1897). His *Disciples of Æsculapius* was published by his daughter, Mrs. George Martin, in 1900.

RICHARDSON, CHARLES FRANCIS (1851–1913). An American literary critic and historian. He graduated at Dartmouth College in 1871, was on the editorial staff of the *Independent* (1872–78) and the *Sunday-School Times* (1878–80), editor of *Good Literature* (1880–82), and afterward until 1911 was professor of Anglo-Saxon and English language and literature in Dartmouth College. His books include: *A Primer of American Literature* (1878); *The Cross* (1879), a volume of poems; *The Choice of Books* (1881); *American Literature* (2 vols., 1887–88); *The End of the Beginning* (1896), a romance; *A Study of English Rhyme* (1909). In 1902 he edited the Arnheim edition of Poe's works

RICHARDSON, CLIFFORD (1856–). An American chemist, born at Worcester, Mass. He graduated at Harvard in 1877. He was assistant chemist in the United States Department of Agriculture in 1878–87, then for seven years inspector of asphalt and cement in the United States engineering department, superintendent for an asphalt company in New York in 1896–1900, and proprietor of the New York Testing Laboratory in 1900–10. Thenceforth he was a consulting expert on asphalt, bitumen, and cement. His publications include: *On American Cereals* (1883); *Adulterations of Condiments and Spices* (1887); *On the Nature and Origin of Asphalt* (1898); *The Constitution of Portland Cement* (1904); *The Modern Asphalt Pavement* (1905; 2d ed., 1908); *Asphalt Construction for Pavements and Highways* (1913).

RICHARDSON, ERNEST CUSHING (1860–). An American librarian and author, born at Woburn, Mass. He graduated at Amherst in 1880, pursued special courses at Washington and Jefferson College, and studied also at Hartford Theological Seminary. Here he taught and was librarian from 1883 until 1890, when he was appointed librarian at Princeton. He served as president of the American Library Association in 1904–05. His writings include: *Classification, Theoretical and Practical* (1901); *Writings on American History* (1902); *Some Old Egyptian Librarians* (1911); *The Begin-*

nings of Libraries (1914); *Biblical Libraries* (1914); and other works upon literary and theological subjects, besides numerous articles on library work.

RICHARDSON, HENRY HOBSON (1838–86). An American architect, born at Priestley's Point, St. James's Parish, La., Sept. 29, 1838. His mother was a granddaughter of Joseph Priestley (q.v.). He graduated at Harvard in 1859, traveled in Europe, studied architecture at the Beaux-Arts, during a portion of his course was employed in the offices of a government architect, and, having returned to the United States in 1865, he began the practice of his profession in 1866 as a member of the firm of Gambrill and Richardson of New York City. In 1875 he removed to Brookline, Mass. He was a member of the American Institute of Architects, of the American Academy of Arts and Sciences, of the Archæological Institute of America, and an honorary and corresponding member of the Royal Institute of British Architects. Among the more important structures designed by him are Trinity Church, Boston, voted by architects one of the 10 most notable buildings in the United States, and, also in Boston, the church known formerly as the Brattle Square Church (Unitarian) and now as the First Baptist, especially remarkable for a fine tower ornamented with a frieze of colossal sculptures; parts of the State Capitol at Albany, N. Y.; Sever and Austin halls, in Cambridge, Mass., for Harvard University; the Allegheny County buildings, at Pittsburgh, Pa.; the Chamber of Commerce, Cincinnati, Ohio; the library of the University of Vermont at Burlington; the public libraries of Woburn and Quincy in Massachusetts; and many notable private residences and commercial and public buildings in the Eastern States. He established the successful use in American architecture of the Romanesque styles of southern France, Auvergne in particular. Repose of manner and a mastery of carved detail and of effects of contrast are characteristic of his work. His distinguishing qualities are breadth, unity, strength, and simplicity; his principal defects an occasional carelessness of technique and a tendency towards an exaggerated expression of power by violent contrasts of treatment. His influence on architecture in the United States was very great, and his work was hailed as giving promise of the development of a distinctive American style. Such, indeed, it was for some years; but in spite of his imitators, his style was too personal to endure long after his death, and its influence declined before the powerful impression produced by the neoclassic buildings of the Columbian Exhibition at Chicago in 1893. In his Brookline workrooms he trained many students. Richardson died of a chronic malady at the age of 47 (April 27, 1886). Consult Mrs. Schuyler Van Rensselaer, *H. H. Richardson and his Works* (Boston, 1888). See Plate of BOSTON, Trinity Church.

RICHARDSON, JAMES (1806–51). An English traveler. See BARTH, HEINRICH; OVERWEG, ADOLF.

RICHARDSON, SIR JOHN (1787–1865). A British Arctic explorer and naturalist, born at Dumfries, Scotland. He studied medicine at Edinburgh, and, having entered the royal navy in 1807 as assistant surgeon, was present at the battle of Copenhagen. He served on the coast of Africa, on the Baltic and North Sea stations, in Canada, and in 1815 in Georgia. He was surgeon and naturalist to Sir John Franklin's (q.v.) polar expeditions of 1820–22 and 1825–27. In the latter journey he traced the continental coast line of America through 20 degrees of longitude and 2 degrees of latitude, discovered a new land and two straits, and did much scientific work. In 1846 Richardson was knighted. Appointed to command the search for Franklin, Richardson, accompanied by Dr. Rae, left Liverpool in March, 1848. After great hardships the party reached Fort Confidence on Great Bear Lake. Richardson spent the winter in scientific observations, and in 1849, leaving Dr. Rae in command, returned to England. The journal of this expedition was published as *An Arctic Searching Expedition* (1851). After 1855 Richardson devoted himself to literary work at Grasmere. Besides contributing largely to the accounts of Franklin's expeditions (1823 and 1828), he published *Fauna Boreali-Americana* (1829–37) and *The Polar Regions* (1861).

RICHARDSON, JOHN (1796–1852). A Canadian journalist and novelist. He was born near Niagara Falls, Ontario, served as a volunteer in the War of 1812, and was made prisoner at the battle of the Thames. After his liberation he joined the British army, went to England in 1815, afterward lived partly in Paris, fought in Spain in 1835 in behalf of the Queen Regent against the Carlists, and in 1838 returned to Canada as special correspondent of the London *Times*. In 1840–42 he edited (after founding) the *New Era* at Brockville, and the *Native Canadian* at Kingston he edited in 1843–45. He afterward lived in the United States, where he did newspaper work until his death. Among his publications are: *Wacousta: An Indian Tale* (1833); *Ecarté, or the Salons of Paris* (1834); *The Canadian Brothers* (1840); *War of 1812* (1842); *Eight Years in Canada* (1847); *Tecumseh* (1853).

RICHARDSON, MAURICE HOWE (1851–1912). An American surgeon, born at Athol, Mass., and educated at Harvard (A.B., 1873; M.D., 1877). He settled in Boston. In 1879 he joined the medical faculty of Harvard, becoming professor of clinical surgery in 1903 and Moseley professor of surgery in 1907. Richardson was a prolific writer and a noted surgeon.

RICHARDSON, OWEN WILLANS (1879–). An American physicist. Born at Dewsbury, England, he was educated at Trinity College, Cambridge (B.A., 1900; M.A., 1904), where he was a fellow in 1902–08, and studied also at the University of London (B.Sc., 1900; D.Sc., 1903). After 1906 he occupied the chair of physics at Princeton University. His discoveries in connection with the electronic and kinetic theories of matter are important. Richardson contributed many papers to the *Philosophical Magazine*, the *Physical Review*, and the *Transactions* of the Royal Society of London (of which body he was elected fellow in 1913). He is author of *Electron Theory of Matter* (1914).

RICHARDSON, RUFUS BYAM (1845–1914). An American classical scholar, born at Westford, Mass. He graduated from Yale College in 1869, studied in the Yale Divinity School (1869–72) and in Europe (1872–74), and received the degree of doctor of philosophy at Yale in 1878. Later he held the chairs of Greek at Indiana University (1880–82) and at

Dartmouth College (1892–93). From 1893 to 1903 he was director of the American School of Classical Studies at Athens; during this period he excavated the ancient gymnasium at Eretria and began the excavations at Corinth (qq.v.). For reports on these excavations, consult *American Journal of Archæology* (1892–1902). His publications include also an annotated edition of Æschines, *Oration against Ctesiphon* (1889); *Vacation Days in Greece* (1903); *History of Greek Sculpture* (1910).

RICHARDSON, SAMUEL (1689–1761). An English novelist, born in Derbyshire. His father was a joiner, who desired to educate his son for the Church; but this he could not afford, so at the age of 16, with such an education as a country school could furnish, the young man went to London, where he became apprentice to one John Wilde, a printer. In 1719 he started as a printer on his own account, first in Fleet Street and soon afterward in Salisbury Court, and, on finding his success assured, he married Martha, daughter of Allington Wilde—not Richardson's former master. In 1754 he became master of the Stationers' Company and in 1760 he purchased the half interest of the patent of King's printer. He died July 4, 1761.

Till he had turned 50 Richardson's relations with literature, except in the way of printing, were of the most slight and amateur kind; but in 1740, a year after two booksellers, Rivington and Osborne, had proposed to him that he should write a volume of familiar letters as patterns for youths and maidens in the country, Richardson surprised the world with his *Pamela*, which had instant and great success. Hughes may have given Richardson a hint for his *Pamela* in a story told in the *Spectator* (375). Its continuation, to which the author was stung by the issue of a pretended sequel, entitled *Pamela in High Life*, was, however, pronounced much inferior. *Pamela* suggested to Fielding his *Joseph Andrews*, originally conceived as a parody of Richardson's somewhat prudish moralities. The satire was not appreciated by Richardson, and he never forgave Fielding. In 1747–48 Richardson issued, in eight volumes, *The History of Clarissa Harlowe*—by common consent his masterpiece—a work which in its progress to completion aroused the most intense interest. His third and last great work, *The History of Sir Charles Grandison*, was published in 1753. As a whole this is less interesting, and in his representation of the life of the fashionable classes, of which he had no clear personal knowledge, the writer succeeds but indifferently.

Richardson's method of minute elaboration is somewhat wearisome. But there are singular sources of attraction in the depth and simplicity of Richardson's sentiment, his profound knowledge of the heart, and his mastery of elemental emotion, and in virtue of the overwhelming effects of pathos in which the interest of his *Clarissa* culminates, a place must be assigned him among the potent masters of genuine tragic passion. His specialty lies in subtle analysis of the feminine heart, and in this particular field he has hardly been surpassed. It seems to have been his instinct to cultivate a curious sort of passionless confidential intimacy with women; throughout life he was the centre of a circle of female friends and admirers, who came to him with their little delicate secrets, as to a kind of lay father confessor; and the fruits of his nice observation of them he has given us to the full in his novels. Richardson is thus the first outright psychologist in English prose fiction. He also created great character types, as Lovelace and Clarissa. His popularity was very great, both in England and on the Continent. He shaped the novel for a half century, and is still a force. Consult his works edited by Leslie Stephen (12 vols., London, 1883); and by W. L. Phelps with *Life* (19 vols., New York, 1901–02); also: *Compendium*, edited by Barbauld (6 vols., London, 1804); Texte, *Jean-Jacques Rousseau et le cosmopolitisme littéraire au XVIIIème siècle* (Paris, 1895), translated into English as *Jean Jacques Rousseau and the Cosmopolitan Spirit in Literature* (London, 1899); C. L. Thomson, *S. Richardson: A Biographical and Critical Study* (ib., 1900); Austin Dobson, *Richardson* (New York, 1902); Leslie Stephen, *Hours in a Library*, vol. i (ib., 1907). The chief authority for Richardson's life is Mrs. A. L. Barbauld's biography, which gives Richardson's *Correspondence* (6 vols., London, 1804). See NOVEL.

RICHARDSON, TOBIAS GIBSON (1827–92). An American surgeon. Born at Louisville, Ky., he studied medicine under Samuel D. Gross and at the University of Louisiana, graduating M.D. in 1848. He was early connected with the University of Louisville as lecturer in anatomy, then moved to Philadelphia and later to New Orleans, where he held the chair of surgery from 1858 until his death. Well known as a practicing surgeon, he was the first successfully to extirpate the parotid gland (1851). In 1878 he served as president of the American Medical Association. Richardson published, among other works, *Elements of Human Anatomy* (1854; 2d ed., 1867). Consult *In Memory of T. G. Richardson* (New Orleans, 1893).

RICHARDSON, WILLIAM ADAMS (1821–96). An American jurist, born at Tyngsboro, Mass. He graduated at Harvard in 1843 and was admitted to the bar in 1846. In 1855 he was appointed to revise the Massachusetts Statutes, and subsequently edited the annual supplements to the State General Statutes. In 1869 he became Assistant Secretary of the United States Treasury, in 1871 visited Europe as agent for the sale of the United States funded loan, and in 1873 became Secretary of the Treasury. In 1885 he was appointed Chief Justice of the Court of Claims, and at one time he was a professor in the Georgetown University Law School. He published: *The Banking Laws of Massachusetts* (1855); *Practical Information Concerning the Debt of the United States* (1872); *National Banking Laws* (1872); *History of the Court of Claims* (1882–85).

RICHARDT, rē'kärt, CHRISTIAN ERNST (1831–92). A Danish poet and dramatist, born in Copenhagen, noted for deep and refined feeling and spiritual and patriotic fervor. He was a pastor from 1872 to 1892. His comedy *The Declaration* (1851) was followed by *Short Poems* (1861); *Pictures and Songs* (1874); *Fifty Poems* (1878); *King and Constable* (1878), a musical drama; *Spring and Autumn* (1884), poems; *Miscellaneous Poems* (1891). *The Holy Land* (1870; 3d ed., 1889) was the fruit of a trip to the Orient. His *Samlede Digte* (Collected Poems) were published in three volumes in 1895.

RICHE, GASPARD CLAIR FRANÇOIS MARIE. See PRONY, G. C. F. M., BARON DE.

RICHEBOURG, rēsh'bo͝or', EMILE (1833–98). A French author, born at Meuvy. He went to Paris in 1850 and was encouraged to write verse by Béranger (q.v.). He became known as a *feuilletonist* and writer of many novels that show more fertility of imagination than literary distinction. Among them are: *Les contes enfantins* (1858); *Cœurs de femmes* (1864); *Les francstireurs de Paris* (1872); *L'Enfant du faubourg* (1876); *Un calvaire* (1880); *Les millions de M. Joramic* (1885). Richebourg wrote also two dramas, *Les nuits de la place royale* and *Un ménage à la mode.*

RICHELIEU, rē'shĕ-lo͞o' *or* -lyē'. A river of Canada (also called Chambly, St. John, and Sorel). It is the outlet of Lake Champlain and flows northward into Lake St. Peter, a widening of the St. Lawrence, at Sorel, and has a straight course of 80 miles, ranging from 1000 feet to 1½ miles in width, through a picturesque and historic country (Map: Quebec, G 6). It is navigable to Chambly, whence a canal to St. John avoids the rapids lying to the south.

RICHELIEU, ARMAND DE VIGNEROT DU PLESSIS. See AIGUILLON, A. DE V. DU PLESSIS RICHELIEU, DUC D'.

RICHELIEU, rēsh'lyē', ARMAND EMMANUEL DU PLESSIS, DUKE DE (1766–1822) A French statesman, grandson of Marshal Richelieu (1696–1788), born in Paris and educated at the College of Plessis. He left France at the beginning of the Revolution, entered the Russian service, under Suvarov, and became lieutenant general. Alexander I made him Governor of Odessa in 1803, but after a brilliant administration there he returned to France in 1815 to form a new ministry under Louis XVIII. His influence with the allied powers enabled him to secure the withdrawal of their troops from France, and he was chief of cabinet until 1818, when he resigned on account of his unsuccessful attempt to change the electoral law, according to his promise to the powers He was recalled in 1820, retired within two years, and died shortly afterward, the last of his name.

RICHELIEU, ARMAND JEAN DU PLESSIS, DUKE DE, CARDINAL (1585–1642). An eminent French statesman, born in Paris, Sept. 5, 1585. He was educated for the army at the Collège de Navarre, but turned to the study of theology in order that he might succeed his elder brother as Bishop of Luçon. This he was able to do on the latter's retirement in 1606, and on April 16, 1607, the youthful prelate was consecrated at Rome in the presence of Pope Paul V. He devoted himself with earnestness to the work of his diocese and was successful as a preacher and administrator. As one of the representatives of the clergy at the States-General in 1614 he attracted the notice of the Queen mother, Maria de' Medici, was made one of the court almoners, and later, in 1616, entered the Royal Council as Secretary for War and Foreign Affairs. The overthrow of Concini and the party of the Queen mother and the rise of the royal favorite, De Luynes, to power, sent Richelieu temporarily back to his bishopric. Reconciled to her son, mainly through the diplomacy of Richelieu, after the death of De Luynes in 1621, Maria de' Medici obtained for the latter a cardinal's hat, and in 1624 he was recalled to the council. He soon became the chief Minister of State and retained that post until the end of his life—the real head of France in everything but name.

The new Minister's first important measure was the arrangement of a marriage between the King's sister, Henrietta Maria, and the Prince of Wales, afterward Charles I. This assured friendly relations with England. It was necessary for Richelieu to suppress the Huguenots as a political faction, to reduce the disturbing nobles to obedience, and to restore the prestige which France had won under Henry IV in the affairs of Europe. While carrying out the first of these objects he made alliances with and gave encouragement to the Dutch and German enemies of the Catholic house of Austria. He regarded the Protestants at home or abroad wholly with the eye of a statesman, and had no religious prejudices. As the power of the Cardinal increased Maria de' Medici became antagonistic. The King trusted him implicitly, but never liked him personally, and always was restive under the mastery of this greater mind. Richelieu's policy was directed towards a unified system of administration in France, and in foreign affairs his chief aim was to humble the power of the Austrian and Spanish Hapsburgs. Richelieu was instrumental in bringing Gustavus Adolphus (q.v.) into Germany, and during the later years of the Thirty Years' War France was an active ally of the Protestant cause in the field. (See THIRTY YEARS' WAR.) In 1628 the rebellious Huguenots were put down and La Rochelle was taken after a siege of 15 months, during which Richelieu commanded in person with great ability In Italy France combated Austria and Spain in the War of the Mantuan Succession (1628–31), and Richelieu's diplomacy secured the recognition of the claims of Charles of Nevers. The ill will of the court nobles whom Richelieu's influence had deprived of power over the weak King showed itself in frequent conspiracies against the Cardinal. Gaston of Orléans, brother of Louis XIII, played a leading part in these plots, which Richelieu punished relentlessly The so-called conspiracy of Chalais ended in death for some of the leaders and imprisonment for others. A second great conspiracy, headed by the Queen mother, reached its crisis on Nov. 11, 1630, when Richelieu himself had almost given up the struggle. The King refused him an audience, but Louis having withdrawn to Versailles, the Cardinal succeeded in seeing him there, overcame the influence of his enemies, demonstrated his necessity to France, and irrevocably fixed his ascendancy. The day became known, from the discomfiture of the conspirators, as the day of dupes. In 1631 the Duke of Montmorency (q.v.) rose against the Cardinal, only to perish on the scaffold. In the last years of his life Richelieu crushed the rising of the Count of Soissons and defeated the conspiracy of Cinq-Mars (q.v.). The later administration of Richelieu formed an important epoch in the history of the constitution of France and in her foreign relations. By a succession of vigorous and effective measures he succeeded in breaking down the political power of the great families of France and making the King an absolute ruler. The policy of war against Austria and Spain vindicated itself in its ultimate results, which, however, Richelieu did not live to see.

There is no question but that Richelieu was unscrupulous in the means that he used. There is equally no question that he used these means with a singleness of purpose for what he believed to be the good of France and his King.

His policy was successful in developing the greatness and the power of France, but burdensome impositions were necessary to meet the enormous expenditures it entailed, and the unchecked absolutism that he fastened upon the country was in the long run a misfortune. The variety and scope of his talents were remarkable. His writings fill several volumes, and some of them have much merit. Of the later ones his *Testament politique* and his *Mémoires* are most important. He also indulged in lighter literary diversions and in the drama, but left nothing noteworthy. He was a liberal patron of literature, and to him France owes the founding of the French Academy. (See INSTITUTE OF FRANCE.) The Palais Cardinal, later known as the Palais Royal, was his Paris residence. He was as capable a military commander as he was a churchman, a civil administrator, and a diplomat.

Bibliography. His *Mémoires sur la règne de Louis XIII*, in "Collection Petitot" (Paris, 1823 et seq.); *Lettres, instructions diplomatiques, etc.*, edited by Georges d'Avenal (8 vols., ib., 1853–77); *Mémoire d'Armand du Plessis de Richelieu*, edited by Armand Baschet (ib., 1880); also: Anaïs de Raucou (called Bazin), *Histoire de France sous Louis XIII* (4 vols., Paris, 1840); Jules Caillet, *L'Administration en France sous le ministère du cardinal de Richelieu* (new ed., 2 vols., ib., 1863); Aimé Martineau, *Le Cardinal de Richelieu* (ib., 1865); Leopold von Ranke, in *Französische Geschichte*, vols. ii, v (3d ed., Stuttgart, 1877–79); M. RICHELIEU, LOUIS FRANÇOIS ARMAND DU PLESSIS, DUKE DE FRONSAC and DUKE DE (1696–1788). A marshal of France, born in Paris, a grandnephew of the great Cardinal. He took an active part in court intrigues and was comrade and assistant to Louis XV in his love affairs. As a soldier he distinguished himself at Fontenoy. He was made marshal in 1748, Governor of Guyenne in 1755, and won great renown in the taking of Port Mahon, Minorca, in 1756. He succeeded Marshal D'Estrées as commander in Hanover, where he enriched himself by pillage and permitted his troops to do the same. His later days, as his earlier, were occupied with the dissipations of the royal circle at Paris. He was a witty, if not a wise, man, and the friend and protector of Voltaire, but better known for his patronage of Du Barry and for his flippancy. His memoirs were edited by Soulavie in 1793, and he is prominent in most other memoirs of the period.

RICHEPIN, rēsh'păN', JEAN (1849–). A French poet, novelist, and dramatist. He was born at Médéah in Algeria, Feb. 4, 1849. For a while he was a sailor, and he served as a rifleman in the Franco-German War. He at first studied medicine and then entered the Ecole Normale in Paris. After an apprenticeship in journalism, fiction, and drama he published (1876) *La chanson des gueux*, for the frank immorality of which he was fined 500 francs and imprisoned one month. In prison he wrote *Les morts bizarres* (1877). Among his works are the poems *Les caresses* (1877), *Les blasphèmes* (1884), *La mer* (1886), *Mes paradis* (1893), *La bombarde* (1899); the novels *La Glu* (1881), *Braves gens* (1888), *Flamboche* (1895), *Contes espagnols* (1901), *L'Aile, roman des temps nouveaux* (1911); and the plays *Nana Sahib* (1882), *Monsieur Scapin* (1886), *Le flibustier* (1888), *Par le glaive* (1892), *Le chemineau* (1897, presented in New York as *The Harvesters* in 1904), *Don Quichotte* (1905), *La route d'émeraude* (1909). In 1905 appeared *Selections from Jean Richepin*, with introduction and notes by Cameron. Richepin is to be counted among the romantics. In the field of drama his work is especially notable. In 1908 he was elected to the French Academy.

RICHER, rē'shā', EDMOND (1560–1631). A French theologian, born at Chaource, Aube. He was made a doctor of theology by the Sorbonne, and taught belles-lettres, rhetoric, and philosophy in the college of Cardinal Lemoine, of which he became director in 1594. The following year, while also syndic of the Sorbonne, he came forward as the chief opponent of the Jesuits, who in their turn attacked his work *De Ecclesiastica et Politica Potestate* (1611), and he was forced to resign his academic offices. He was summoned to appear before the Inquisition at Rome, and was imprisoned on his return to Paris, but was released upon his retraction and became canon of Paris. He made his defense in *Historia Conciliorum Generalium* (1683) and *Histoire du syndicat de Richer* (1753), both published posthumously. He also wrote *De Analogia, Causis Eloquentiæ et Linguæ Patriæ Locupletandæ Methodo* (1601), and other works.

RICHER, PAUL (1849–). A French neurologist, born at Chartres. He was educated in Paris, from 1882 to 1895 was director of the laboratory connected with the Salpêtrière clinic of nervous diseases, and in 1898 was elected to the Academy of Medicine. In 1903 he became professor of anatomy at the Ecole des Beaux-Arts. He wrote *Etudes cliniques sur l'hystéro-épilepsie ou grande hystérie* (1881, crowned by the Institute; 2d ed., 1883, under the title *Etudes cliniques sur la grande hystérie ou hystéro-épilepsie*). But he is perhaps better known for his connection with art and anatomy. A pupil of Charcot and a draftsman of some ability, he published, in collaboration with his master, *Les démoniaques dans l'art* (1886) and *Les difformes et les malades dans l'art* (1889); and, alone, an *Anatomie artistique* (1890), which was crowned by the Academy of Fine Arts and by the Academy of Sciences; *Paralysies et contractures hystériques* (1892); *Physiologie artistique de l'homme en mouvement* (1895); *Nouvelle anatomie artistique du corps humain* (1906).

RICHET, rē'shā', ALFRED (1816–91). A French surgeon, born at Dijon. He studied in Paris and rose rapidly in his profession, became a member of the Academy of Medicine in 1865, did good service in the ambulance corps in the siege of Paris, in 1873 was made Commander of the Legion of Honor and in 1883 member of the Academy. Long professor of clinical surgery (1864–91), he wrote *Traité pratique d'anatomie médico-chirurgicale* (1857; 4th ed., 1873) and, among special treatises, *Leçons cliniques sur les fractures de la jambe* (1875).

RICHET, CHARLES ROBERT (1850–). A French physiologist, son of Alfred Richet. He was born and educated in Paris, was a prominent member of the French Biological Society after 1881, and received in 1879 a prize from the Institute for his monograph, *Propriétés chimiques et physiologiques du suc gastrique.* In 1887 he succeeded Béclard as professor of physiology in the medical faculty of the University of Paris, and in 1899 was chosen a member of the Academy of Medicine. Richet was awarded the Nobel prize in medicine for 1913. His works include: *La circulation du sang* (1879), a translation of Harvey on the circulation of the blood; *L'Homme et l'intelligence* (1884; 2d ed., 1887); *Essai de psychologie générale* (1888; 2d ed., 1891; Russ. trans., 1889; Pol., 1890); *Physiologie* (1893–1902); and, with others, a *Dictionnaire de physiologie* (1895–1906). Richet is best known for his research into the phenomenon which he called anaphylaxis (q.v.). This he had first explained with Portier in 1902 (See also SERUM THERAPY and consult his *L'Anaphylaxie,* 1911; Eng. trans., 1913) He wrote besides on international peace and other subjects.

RICH'FIELD. A village in Hennepin Co., Minn., adjoining the city of Minneapolis on the north, on the Dan Patch Electric Line. It is purely a farming community and has fine greenhouses Pop., 1910, 2673.

RICHFIELD. A city and the county seat of Sevier Co., Utah, 150 miles south of Salt Lake City, on the State Canal and on the Denver and Rio Grande Western Railroad (Map: Utah, B 4). It contains a Carnegie library, fine high and grade school buildings, a county courthouse, and the Sevier State Tabernacle (Mormon). Farming, dairying, and the raising of live stock, sheep, and sugar beets are carried on extensively, and there are sugar and plaster factories. Pop., 1900, 1969; 1910, 2559.

RICHFIELD SPRINGS. A village in Otsego Co., N. Y., 35 miles southeast of Utica, near Canadarago Lake, on the Delaware, Lackawanna, and Western and the Otsego and Herkimer railroads (Map: New York, E 5). There are mineral springs, frequented for their medicinal properties. Beautiful scenery and attractive drives are to be noted here. There are manufactures of milk products and knit goods. Settled in 1758, Richfield Springs began to be known as a resort in 1820. Pop., 1900, 1537; 1910, 1503; 1915 (state census), 1623.

RICH HILL. A city in Bates Co., Mo., 85 miles south by east of Kansas City, on the Missouri Pacific and the Kansas City, Fort Scott, and Memphis railroads (Map: Missouri, B 3). It is situated in the mineral belt of southwest Missouri, in the region noted for its extensive coal fields. Rich Hill carries on considerable trade in farm produce and live stock and has manufactories of vitrified brick and tile. Pop., 1900, 4053; 1910, 2755.

RICHLAND CENTER. A city and the county seat of Richland Co., Wis., 60 miles west of Madison, on the Chicago, Milwaukee, and St. Paul Railway (Map: Wisconsin, C 5). It is a trading centre, with manufactures of excelsior and other lumber products, condensed milk and cheese. There are a courthouse, city auditorium, and a Carnegie library. Pop., 1910, 2652.

RICH'MOND. A city of the State of Victoria, Australia, constituting a suburb of the city of Melbourne (q.v.). Pop., 1901, 37,722; 1911, 38,643.

RICHMOND. A town in Surrey, England, 8 miles west-southwest of London, on the right bank of the Thames (Map: England, F 5). It is a favorite summer resort for Londoners. The rich scenery of the vicinity is seen with advantage from the terrace, which stretches along the brow of the hill, on the slopes and summit of which the town is built. The banks of the Thames are studded with villas, and around the town are numerous nurseries and kitchen gardens. As Schene or Sheen, Richmond was a royal residence from the time of Edward I until the reign of James II. To the southeast of the town is Richmond Park, presented to the citizens of London by Charles I in 1634. Richmond was not incorporated until 1890, but had been favored with a progressive vestry which established a water supply, public baths, and a free library. The municipality has a fine town hall, artisans' dwellings, technical school, and isolation hospital. Pop., 1901, 31,672; 1911, 33,221. Consult *Victoria History of the County of Surrey,* vol. iii, edited by H. E. Malden (London, 1911).

RICHMOND. A town and the county seat of Richmond County, Quebec, Canada, on the St. Francis River and on the Grand Trunk Railway, 76 miles by rail east of Montreal (Map: Quebec, H 6). St. Francis College and a Roman Catholic convent are located here. The town has a variety of manufactures. It is connected with Melbourne by a free highway bridge. Pop., 1901, 2057; 1911, 2175.

RICHMOND. A city in Contra Costa Co., Cal., 8 miles by water from San Francisco, on the Atchison, Topeka, and Santa Fe and the Southern Pacific railroads. It has 6 miles of natural deep-water frontage on the western side of San Francisco Bay, and an inner harbor is being constructed (1915) at the southern side of the city. Richmond is the oil centre of the Pacific coast, the Standard pipe lines having their terminus here and the company's fleet of 60 vessels making this its home port. There is also here the largest refinery in the West. The Santa Fe system has large shops and yards, and the Pullman car shops are situated here. Other industrial establishments include pipe and steel works, extensive porcelain-ware and bathtub factories, one of the largest wineries in the world, a furniture factory, brickworks, foundries, machine works, stone quarries, and manufactories of carbon products, chemicals, novelties, matches, etc. The city's most prominent structures are the Carnegie library, splendid school buildings, and the new city hall. Richmond's growth has been unusually rapid, the population in 1915 being locally estimated at 22,000. Pop., 1910 (U. S. census), 6802.

RICHMOND. A city and the county seat of Wayne Co., Ind., 69 miles east of Indianapolis, on the Whitewater River, here crossed by iron bridges, and on the Pittsburgh, Cincinnati, Chicago, and St. Louis, the Grand Rapids and Indiana, the Chesapeake and Ohio of Indiana, and the Ohio Electric railroads (Map: Indiana, H 5). It is the seat of Earlham College (Orthodox Friends), opened in 1847, and has the Morrison-Reeves Library (public) with 30,000 volumes, and the Richmond Law Library. The Eastern Indiana Hospital for the Insane is here, also Reid Memorial Hospital, and homes for

orphans and for aged women. There are fine public school buildings. Glen Miller Park comprises about 135 acres. The yearly meeting of the Orthodox Friends of Indiana is held in Richmond. The city is the commercial centre of a fertile agricultural region, and is important also for its manufactures. The chief products include threshing machines, traction engines, grain drills, office furniture, lawn mowers, automobiles, caskets, kitchen cabinets, wire fence, ventilating appliances, underwear, gloves, pianos, flour, sawed lumber, etc. Pop., 1900, 18,226; 1910, 22,324; 1915 (U. S. est.), 24,314

RICHMOND. A city and the county seat of Madison Co., Ky., 50 miles southeast of Frankfort, on the Louisville and Nashville Railroad (Map: Kentucky, F 4). It has Madison Female Institute and the Eastern Kentucky State Normal School. There are flouring and planing mills, railroad shops, and three tobacco warehouses. Farming, tobacco raising, and horse breeding are chiefly pursued. Pop., 1900, 4653; 1910, 5340.

RICHMOND. A city and the county seat of Ray Co., Mo., 45 miles east by north of Kansas City, on the Atchison, Topeka, and Santa Fe Railroad (Map: Missouri, C 2). It is situated in a region engaged in agriculture, cattle raising, and coal mining, and has flour and lumber products. Pop., 1900, 3478; 1910, 3664.

RICHMOND. The largest city of Virginia and a port of entry, the State capital and county seat of Henrico County, 116 miles south by west of Washington, D. C. (Map: Virginia, G 4). It is situated on the James River, 127 miles from the Atlantic Ocean, at the head of tidewater. The rapids here have a fall of 100 feet in 6 miles and furnish an immense water power. A canal extends around the rapids, but is not now navigable; it is used to supply water power for the city. Several bridges span the James, which flows through the city. There are steamship lines to Atlantic coast ports, and the railroad facilities comprise the Southern Railway, the Atlantic Coast Line, the Seaboard Air Line, the Chesapeake and Ohio, the Norfolk and Western, the Richmond, Fredericksburg, and Potomac, and other roads.

The site of Richmond is of great natural beauty. It is regularly laid out on a succession of low hills that rise from the banks of the James, the highest point reaching an altitude of 250 feet above the sea. The area is about 25 square miles. The parks and cemeteries of Richmond and its monuments are of especial interest. The public park system, with an aggregate of 639 acres, includes Joseph Bryan Park of 263 acres, the magnificent gift to the city of Mrs. Joseph Bryan and her five sons; William Byrd Park with 300 acres on the western bounds of the city; Monroe, Gamble's Hill, Jefferson, Marshall, and Chimborazo parks, besides the Capitol Square. Capitol Square, on Shockoe Hill in the heart of Richmond, is 12 acres in extent. Here is situated the State capitol (1785–96), modeled, at the suggestion of Thomas Jefferson, after the Maison Carrée at Nîmes. In the capitol are busts and portraits of many eminent men, including the celebrated marble statue of Washington by the French sculptor Houdon in the rotunda. There are also in the square the new State Library, used mainly as an office building, the Governor's mansion, and the old Bell house. Prominently placed on the grounds, near the capitol, is a splendid monument to Washington. Statues of Henry Clay and "Stonewall" Jackson by Hart and Foley respectively, and bronze statues of William Smith, the war governor, and of Kuniar McGuire, a distinguished surgeon, further adorn Capitol Square.

In Monroe Park are a statue of General Wickham and one of Joseph Bryan, widely known as a man of affairs and a philanthropist. Gamble's Hill Park is noteworthy for the splendid view it affords. It overlooks the famous Tredegar Ironworks and the river with the historic Belle Isle and other islands. On the hill, in Libby Hill Park, stands the Confederate Soldiers and Sailors Monument. This elevation commands a fine view of the James and its islands and bridges. In Chimborazo Park (29 acres) was a well-known Confederate hospital. A fine road leads from this park to the National Cemetery at Seven Pines, 5 miles southeast of the city. At the east end of the stately Monument Avenue, 160 feet wide, stands the statue of Gen. J. E. B. Stuart; farther on the statue of Gen. Robert E. Lee in Lee Circle. Several squares west of here stands the great Jefferson Davis Monument. The Jefferson Monument and the Howitzer Monument also are worthy of note. Hollywood Cemetery is the most interesting in Richmond. There lie many famous persons, as well as 18,000 Confederate soldiers, in honor of whom is a rough pyramidal monument of granite. Other cemeteries are Shockoe Hill, the oldest in Richmond, Riverview, Mount Calvary, and Oakwood, the last having several thousand Confederate graves. The National Cemetery contains 6553 graves, 5700 of unknown dead.

The city hall, facing Capitol Square on the north, is a handsome structure of granite with a tower 180 feet high. The Sacred Heart Cathedral (Roman Catholic), presented by Mr. and Mrs. Thomas F. Ryan, is the country's third finest cathedral. Other edifices are the Chamber of Commerce, State Penitentiary, Soldiers' Home, and the union depot of the Chesapeake and Ohio, the Southern, and the Seaboard Air Line. Among historic buildings are the Old Stone House, the oldest in Richmond; St. John's Church (1740); the White House of the Confederacy, now a repository for Confederate relics; General Lee's residence, the home of the State Historical Society; the Masonic Temple, dating from 1785; and Chief Justice Marshall's house. The Valentine Museum has more than 100,000 archæological specimens, many objects of historic interest, and an art collection. Richmond is the seat of Richmond College (q.v.), opened in 1832; Union Theological Seminary (Presbyterian), opened in 1812; and the Medical College of Virginia. The institutions for colored students include the Hartshorn Memorial College and Virginia Union University (Baptist), opened in 1899. The private schools of the city and the Mechanics' Institute are of very high reputation. The State Library, with nearly 100,000 volumes, is the largest in the city. Other important collections are the Rosemary Public Library, the State Law Library, and the Virginia Historical Society Library. The position which Richmond has long held in the medical world has brought about the establishment of a number of excellent hospitals, the Grace, the Memorial, the Stuart Circle, St. Luke's, the Johnston, Sillis, the Virginia, the St. Elizabeth, the Sheltering Arms, and others.

Richmond is an important industrial and commercial centre, with a great wholesale, jobbing, and retail trade. The jobbing trade in the year 1914 totaled about $80,000,000 and the retail trade about $34,000,000. Bank clearings for 1914 aggregated over $420,000,000. Plans are under way for deepening the channel of the James from Richmond to the sea, so as to provide a minimum depth of 22 feet at mean low tide. This improvement will add considerably to the commercial advantages of the city. As an industrial centre Richmond ranks first in the State, its tobacco and iron interests being of primary importance. It is one of the leading tobacco markets in the United States, the tobacco industry being represented by stemming and rehandling establishments and by manufactories of chewing and smoking tobacco, snuff, cigars, and cigarettes. The iron interests include foundries and machine shops, locomotive works, car-axle and railroad-spike works, and nail, horseshoe, and agricultural-implement works. Flour and fertilizers also are manufactured extensively. Other products are boxes, carriages and wagons, lumber (cedar, woodenware, hubs, and spokes, etc.), tin roofing, tin tags, baking powder, paper, twine, meat juice, trunks and bags, hats, etc. The various industries in the census year 1914 possessed $37,000,000 capital and the output was valued at $98,177,000.

The municipal government is vested in a mayor, serving four years, a bicameral council, and administrative officers and five commissioners (the administrative board). Richmond spends annually for maintenance and operation about $3,227,000, the chief items being: interest and redemption of debt, $833,335; the gas works, $402,384; schools, $713,035; the police department, $223,461; the fire department, $253,395; streets and sewers, $1,290,870; charitable institutions, $48,000. The actual income for the fiscal year 1915 was more than $5,000,000. The water works and the gas works are the property of the municipality. The gas plant cost $1,373,000 and now has 142 miles of mains. The waterworks system cost $4,192,000 and includes 191 miles of mains. There are two reservoirs with a storage capacity of 53,000,000 gallons and a daily pumping capacity of 32,000,000 gallons, and a settling-basin system with a holding capacity of 200,000,000 gallons. The net debt of the city in 1912 was about $9,129,327; the assessed valuation of real and personal property was $148,768,790

The population of Richmond in 1800 was 5737; in 1850, 27,570; in 1870, 51,038; in 1880, 63,600; in 1890, 81,388; in 1900, 85,050; in 1910, 127,628

In 1609 Capt. John Smith bought from the Indians a tract of land near the site of Richmond and founded a settlement which he called None Such. In 1645 Fort Charles was built in the vicinity, and near here in 1676 Nathaniel Bacon (q.v.) defeated the Indians in the battle of Bloody Run. By grants in 1675 and 1687 Col. William Byrd obtained possession of the land in this district, and in 1733 his son, Col. William Byrd, laid out a town which he named Richmond. In 1742 Richmond was incorporated. In St. John's Episcopal Church in 1775 Patrick Henry made his famous speech, closing with the words, "give me liberty or give me death." Richmond became the capital of the State in 1779, and in 1782 it was chartered as a city. On Jan. 5, 1781, a small English force under Gen. Benedict Arnold entered the place and destroyed all the warehouses and public buildings. In 1788 the convention which ratified the Federal Constitution for Virginia met in St. John's Church. The Virginia Resolutions of 1798–99 were passed at Richmond, and here, in 1861, Virginia formally adopted the Act of Secession. From May, 1861, to April, 1865, Richmond was the capital of the Confederacy, and as such was the objective point of the Federal forces, which fought 15 pitched battles and at least 20 skirmishes in the effort to capture it. On April 2, 1865, it was evacuated by the Confederates, who, by order of General Ewell, set fire to the warehouses and destroyed the greater part of the business portion of the city. The Federal forces entered the place on the day after its evacuation. Consult "Richmond since the War," in *Scribner's Monthly* (New York, 1877); Wood, *The Industries of Richmond* (Richmond, 1886); W. W. Henry, "Richmond," in L. P. Powell (ed.), *Historic Towns of the Southern States* (New York, 1900).

RICHMOND, CHARLES ALEXANDER (1862–). An American university chancellor. He was born in New York, where he attended the city college for one year, and graduated from Princeton in 1883 and from the seminary there in 1888. Ordained to the Presbyterian ministry, he then held pastorates at Aurora, N. Y., in 1888–94, and at Albany, N. Y., from 1894 to 1909. Thereafter he was president of Union College and chancellor of Union University. Chancellor Richmond received the degree of D.D. from Hamilton College in 1904 and that of LL.D. from Rutgers College in 1909, from New York University in 1910, and from Princeton in 1915. He is author of *The Four Winds* (1902) and *Safeguards of American Democracy* (1913).

RICHMOND, CHARLES LENNOX, third DUKE OF (1735–1806). An English diplomat and statesman. He was born in London and succeeded to the peerage on the death of his father, the second Duke, in 1750. He was educated at Westminster School, later proceeding to Leyden University, where he graduated in 1753. He entered the army, saw active service in France, and was mentioned for his bravery at the battle of Minden in 1759, where he served as colonel of his regiment. He was appointed a lord of the bedchamber in 1760, but, disagreeing with George III, resigned and joined the opposition ministry. In 1765 he was sent to Paris as Ambassador Extraordinary, became a Privy Councilor, and the following year was appointed Secretary of State for the South. He was a strong supporter of the American Colonies in their demands for redress of grievances; in 1770 he introduced conciliatory resolutions which were carried by a majority, and in 1775 during a debate on American affairs defended the attitude of the colonists, declaring that their resistance was "neither treason nor rebellion, but perfectly justifiable in every possible political and moral sense." In 1778 he moved the resolution for the withdrawal of the troops from America. In 1782 he received the appointment of master general of ordnance with a cabinet seat, and was created Knight of the Garter.

RICHMOND, LEGH (1772–1827). An English writer and evangelical divine, born in Liverpool. He graduated at Trinity College, Cam-

bridge (1794), and was curate of Brading and Yaverland in the Isle of Wight and after 1805 chaplain to the Lock Hospital, London, and rector of Turvey in Bedfordshire. He was an earnest evangelical preacher. Between 1809 and 1814 he contributed to the *Christian Guardian* three village tales, reprinted together in 1814 as *The Annals of the Poor*. Of one of these, *The Dairyman's Daughter*, 4,000,000 copies had been issued in 19 languages before 1849. Richmond published also *Fathers of the English Church* (1807–12). Consult the *Life* by T. S. Grimshaw (London, 1828; ed. by G. T. Bedell, Philadelphia, 1846) and T. Fry, *Domestic Portraiture* (London, 1833).

RICHMOND, SIR WILLIAM BLAKE (1843–). An English historical and portrait painter. He was born in London and studied at the Royal Academy Schools. Originally a follower of Burne-Jones, after a visit to Italy he adopted the style of the classic genre made popular by Leighton and Alma-Tadema. His paintings include "Amor Vincit Omnia" and "An Audience in Athens" (1885, in the Birmingham Gallery). He was Slade Professor at Oxford from 1878 until 1883, became a Royal Academician in 1895, and was knighted in 1897. He designed and superintended the mosaic decoration of the interior of St. Paul's Cathedral, London, but is perhaps seen at his best in his fresh and delicate pictures of children.

RICHMOND COLLEGE. A corporate name which includes two coördinate colleges at Richmond, Va., Richmond College for men and Westhampton College for women. Richmond College was founded in 1832 and Westhampton College was opened in September, 1914, with the same standards of education and essentially the same curriculum and requirements for degrees. The two institutions are under one board of trustees and one president, but each institution has its separate dean. The same faculty of men give instruction in both. There are in addition several women instructors, who teach only in the college for women. The two institutions are strictly coördinate, each with its own institution, and not coeducational. Richmond College for men includes a college of liberal arts and a law school. The total number of students in attendance in the coördinate colleges in 1915 was 424. The faculty numbered 43. The productive funds in the same year amounted to $1,125,000. The value of the grounds and buildings was $1,250,000 and the annual income was about $110,000. The library contains about 25,000 volumes. The institution is under Baptist control. The president in 1915 was F. W. Boatwright, M.A., LL.D.

RICHTER, rĭk'tẽr, AEMILIUS LUDWIG (1808–64). A German jurist, born at Stolpen, Saxony, and educated at Leipzig. His *Corpus Juris Canonici* (1833–39) led to his being appointed assistant professor of law in Leipzig, and subsequently he held the chair of Church law at Marburg and then at Berlin. He also served as councilor in chief of the consistory and Privy Councilor of the government. Richter is considered the founder of a new school of Church law—the so-called Berliner Kanonisten-Schule. His publications include: *Beitrage zur Kenntnis der Quellen des canonischen Rechts* (1834); *Canones et Decreta Concilii Tridentini* (1853); *Lehrbuch des katholischen und evangelischen Kirchenrechts* (1842; 8th ed., by Dove and Kahl, 1886), which is considered a most important contribution to Church law literature. Of the *Kritische Jahrbücher für deutsche Rechtswissenschaft*, which he founded in 1836, he was editor until 1848.

RICHTER, EUGEN (1838–1906). A German politician, born in Düsseldorf and educated at Bonn, Heidelberg, and Berlin. In 1864 his election as burgomaster of Neuwied was not confirmed, because of his liberal views. He was elected to the North German Diet in 1867, to the Prussian House of Deputies in 1869, and in 1871 to the Reichstag, where he was a leader of the Progressists and later of the Liberals. Intensely individualistic, he attracted attention by his opposition to state control of railroads, increase of war budgets, an Imperial colonial policy, and protectionism. Richter's opposition to Bismarck was particularly bitter. His political attitude sometimes placed him in opposition to his own party, and the *Freisinnige Zeitung*, founded by him in 1885, was on many subjects, especially on social reform, in direct contradiction to the other papers of the party. He wrote: *Politisches A B C Buch* (1879; 10th ed., 1903); *Die Irrlehren der Sozialdemokratie* (1890); *Sozialdemokratische Zukunftsbilder* (1891; in English, 1892); *Jugenderinnerungen* (1892); *Im alten Reichstag, Erinnerungen* (1894).

RICHTER, FRANZ XAVIER (1709–89). A German composer, born at Holleschau (Moravia), one of the most important of the Mannheim symphonists. (See MUSIC, HISTORY OF, *XIX.*) He joined the Mannheim Orchestra in 1747, and from 1769 till his death was musical director at the Strassburg Cathedral. He wrote an oratorio, *La Deposizione della Croce* (1748), 28 masses, numerous motets and psalms, 69 symphonies, and much chamber music.

RICHTER, GUSTAV (1823–84). A German figure and portrait painter, born in Berlin. He began his studies at the academy there under Eduard Holbein, then was a pupil of Cogniet in Paris, and studied in Rome until 1849. The technical qualities of his "Raising of Jairus's Daughter" (1856, National Gallery, Berlin), painted for King Frederick William IV, aroused great enthusiasm on its exhibition, but both this and a large oil painting, "Building of the Pyramids" (1859–72, Maximilianeum, Munich), ordered by the King of Bavaria, suffer from theatrical pathos. Recognizing the limitations of his talent, Richter confined himself thereafter to single figures and portraiture, in which he was more successful. The first of a series of portraits of aristocratic beauties was that of Princess Carolath (1872). Of several family groups, reflecting the artist's own domestic happiness, two called "Evviva!", the painter with his first-born, and "Maternal Happiness," the painter's wife (youngest daughter of Meyerbeer) with their second son, were among the gems of the exhibition in 1874. His maturest works combine thorough characterization with real pictorial qualities. Fine examples are: "Banker's Wife" (1876), Countess Károlyi (1878), and, best of all, the well-known ideal portrait of Queen Louise (1879, Cologne Museum). Mention should be made also of the portraits of Emperor William I (1876, 1877), Empress Augusta (1878), and General Count von Blumenthal (1883, unfinished, National Gallery, Berlin).

RICHTER, HANS (1843–1916). An Austrian musical conductor, born in Raab, Hungary, where his father was kapellmeister. In

1853 he became a chorister in the court chapel at Vienna and began his musical studies at the conservatory. From the year 1866 dated his intimacy with Wagner, who in 1868 secured him the appointment of chorus master at the Munich Opera. Two years later he conducted *Lohengrin* at Brussels, and from 1871 to 1875 served as kapellmeister at the Budapest National Theatre. He conducted the concerts of the Vienna Gesellschaft der Musikfreunde for several seasons, gave many important concerts, and in 1876 conducted the *Nibelungen* performances at Bayreuth. In 1877 he commenced the annual Richter concerts, in London, which were among the most important musical events of the season. In 1897 he settled in Manchester as conductor of the Symphony Orchestra, also conducting the Wagner performances at Covent Garden, London. In 1911 he returned to Vienna. He conducted also the Lower Rhenish festivals and many important English festivals. Oxford gave him an honorary degree.

RICHTER, JOHANN PAUL FRIEDRICH, usually called by the name he chose himself, JEAN PAUL (1763–1825). The most widely known of German humorists. He was born at Wunsiedel, a town in Upper Franconia, and spent the impressionable years of his boyhood in the country at Joditz and Schwarzerbach, going in 1779 to attend the Gymnasium at Hof. Soon his father died, leaving his wife and Jean Paul to be cared for by Jean Paul's grandparents at Hof. On their death the mother and son were penniless and had to make what shift they could while Jean Paul studied at the Gymnasium. In 1781 he went to Leipzig to study theology, but he soon fell under the influence of Rousseau and of English humorists and satirists. He had earlier begun to make a collection of jests and anecdotes. Finding no opening as a teacher, he turned to literature. The *Encomium Moriæ* of Erasmus set him to writing his *Lob der Dummheit*, but this book was not published till after his death. In his anonymously published *Grönländische Prozesse* (1783–84) he satirized authors, women, theologians, ancestral pride, etc., but his satire fell rather flat. Poverty soon drove him to flee from Leipzig to avoid his creditors (1784). The next years he spent in reading, hack writing, and desultory rambling. Then some parents were induced to trust him with the education of their children, and for nine years he practiced his original pedagogic theories, writing the while some clever satires, *Auswahl aus des Teufels Papieren* (1789), the more famous idyls *Schulmeister Wuz* (1793), *Quintus Fixlein* (1796; trans. by Carlyle, 1827), with its appendix, *Fälbels Reise* (1796), and the novels *Die unsichtbare Loge* (1793) and *Hesperus* (1794; trans., 1865). *Hesperus* attracted the attention of Charlotte von Kalb, who, in 1796, invited Richter to Weimar, where Goethe received him with cool politeness, as did Schiller at neighboring Jena, his influence being contrary to their own aspirations for a classical German literature. Herder's welcome was warm, and Charlotte von Kalb tendered her heart with her hand, Weimar society being in those days still "imperfectly monogamous."

In the first flush of his good fortune Richter wrote *Blumen-, Frucht- und Dornenstücke, oder Ehestand, Tod und Hochzeit des Armenadvokaten Siebenkäs* (1796–97; trans., 1844, 1871, 1877), said by Meredith to be the finest bit of humorous writing in German, and *Das Kampanerthal* (1797). He fascinated the Weimar ladies with his conversation and still more by his sympathetic listening smile. He returned to Hof, only to take wing for longer flights to Weimar, Leipzig, and Berlin, where he married Caroline Mayer (1801). After three years of wedded wandering he settled in Bayreuth. Here he passed the rest of his life, 21 years, in somewhat eccentric quiet. The rather unsuccessful novel *Titan* (1801–03), showing the influence of Goethe's *Wilhelm Meister*, had already appeared. The first fruit of Bayreuth was the uneven and unfinished *Flegeljahre* (1804–05), with passages of charming description, humorous satire, and delicate fancy that suggest Laurence Sterne. This is Richter's last work of pure imagination that one is not glad to forgive and forget. But in his last years he made valuable contributions to pedagogy in *Levana* (1807), to art in his *Vorschule der Aesthetik* (1804), and to politics in his *Dämmerungen für Deutschland* (1809) and *Fastenpredigten* (1810–12), continued with redoubled scorn in 1817. *Levana*, though disconnected and unfinished, was full of fruitful suggestion, especially in its portions dealing with the education of women. Goethe praised it warmly for "the boldest virtues, without the least excess." The *Aesthetik* is valuable chiefly for its keen analysis of humor and happy praise of wit. It closes with a glowing eulogy of Herder and is a fragmentary development of his theory. The political papers, the most virile and practical of Richter's works, were bold denunciations of Napoleon and the German sycophants, whereas those of 1817 held up to even more merited shame the German princes who mocked the promises by which they had regained power. Disease troubled the peace of Richter's last years. He traveled much, and might to advantage have written less. He died in Bayreuth, Nov. 14, 1825. An *Autobiography* appeared in 1826. Though once quite popular and prized by many good judges of literary work, Richter is difficult and therefore very little read, nor did he exert a lasting influence on German literature.

Richter's complete works were published in 60 volumes (Berlin, 1879); selected works by Freye and Berend, 8 volumes (Berlin, 1908–10); the selections in 6 volumes by P. Nerrlich in the Kürschner's *National-Literatur* (1884–87) are also good. Material for Richter's biography is to be found in the autobiographical *Wahrheit aus Jean Pauls Leben* (Breslau, 1826–33; continued by Otto and Förster); R. O. Spazier, *Biographischer Kommentar* (5 vols., Leipzig, 1833); *Correspondence of Richter with C. Otto* (Berlin, 1829–33); *Correspondence of Richter with his Wife and Otto*, edited by P. Nerrlich (Berlin, 1902); F. J. Schneider, *Jean Pauls Jugend* (ib., 1905). Of interest are: Thomas De Quincey, *Life of Richter* (London, 1845); selections from his writings by Lady Chatterton (ib., 1859); P. Nerrlich, *Jean Paul, sein Leben und seine Werke* (Berlin, 1889); Carlyle, *Miscellaneous Essays*, vols. i, iii (new ed., Boston, 1901), interesting, but not wholly trustworthy; Johann Volkelt, *Die Kunst des Individualisirens in den Dichtungen Jean Pauls* (Halle, 1902); Münch, *Jean Paul, der Verfasser der Levana* (Leipzig, 1907); Berend, *Jean Pauls Aesthetik* (Berlin, 1909).

RICHTER, JULIUS (1862–). A German theologian, born at Gross Ballerstedt, near Osterberg. He studied theology at the universities

of Leipzig and Berlin and held several pastorates in the Province of Brandenburg. Later he became professor at Berlin and was vice chairman of the continuation committee of the Edinburgh World Missionary Conference. He founded and edited the *Evangelische Missionen* and became editor of the *Allgemeine Missions Zeitschrift* and of the *Jahrbücher der vereinigten deutschen Missionskonferenzen*. His writings include: *Indische Missionsgeschichte* (1906; Eng. trans., *History of Indian Missions*, 1908); *Allgemeine evangelische Missionsgeschichte* (1908; Eng. trans., *History of Protestant Missions in the Near East*, 1910); *Die Bedeutung der norddeutschen Missions Gesellschaft für das Missionsleben Deutschland* (1911); *Weltmission und theologische Arbeit* (1913); *Das deutsche Kolonialreich und die Mission* (1914).

RICHTER, LUDWIG (1803–84). A German landscape painter, etcher, and draftsman, most important as an illustrator. He was born in Dresden, the son of the engraver Karl August Richter (1778–1848), who first instructed him. After his return from a sojourn in Rome (1823–26), he was appointed instructor in drawing at the porcelain factory in Meissen and in 1836 at the Dresden Academy, where he continued as professor from 1841 to 1877. The interest of his uneventful life centres within the circle of his art. As a painter Richter aimed at a thorough blending of the figure element with the landscape and may be judged by the following examples: "Harvest Procession in the Campagna" (1833) and three others in the Leipzig Museum; "Ferry at the Schreckenstein" (1836) and "Bridal Procession in Springtime" (1847), in the Dresden Gallery; "View in the Riesengebirge" (1839), in the National Gallery, Berlin. Among his 240 etchings are about 140 views in Saxony, others of Salzburg, Rome, and the Campagna His individuality is most completely revealed in his 3000 or more drawings for woodcuts, of which art he was one of the most influential revivers. Of special charm are his illustrations for *The Vicar of Wakefield* (1841), for Musäus' *Volksmärchen* (1842) and for numerous other fairy tales, for the *Goethe Album* (1855), for Schiller's *Glocke* (1857), and those cyclical publications which reveal the most brilliant side of the artist's inexhaustible fancy, such as *Beschauliches und Erbauliches* (1851); *Kinderleben* (1852); *Fürs Haus* (1858–61); *Der gute Hirt* (1860); *Unser täglich Brot* (1866); *Bilder und Vignetten* (1874). Their great popularity is due to the sunny character of his art and to its *gemüt*, for the drawing is weak and generalized, though not untrue to nature. An eye disease put a stop to the practice of his art in 1874; he was pensioned in 1877, and died at Loschwitz, near Dresden. Consult his autobiography, *Lebenserinnerungen eines deutschen Malers*, edited by his son Heinrich (12th ed., Frankfort, 1905); the monographs by J. F. Hoff (Dresden, 1877), Johannes Erler (Leipzig, 1897), and V. Mohn (Bielefeld, 1898); Atkinson, in *Art Journal* (London, 1885); Lützow, *Die vervielfaltigende Kunst der Gegenwart* (Vienna, 1886).

RICHTHOFEN, rĭkt'hō'fen, FERDINAND, BARON (1833–1905). A German traveler, geologist, and geographer, born at Karlsruhe in Silesia. He studied in Breslau and Berlin, traveled in eastern Asia and Oceanica (1860–68), and after a short stay in California explored Japan and China. In 1875 he was named professor of geography at Bonn, in 1883 at Leipzig, and in 1886 at Berlin. In 1902 he became director of the newly founded Institut für Meereskunde, in the German capital, and editor of its publications. For a number of years he was president of the *Gesellschaft für Erdkunde*. His chief works include: *Geognostische Beschreibung der Umgebung von Predazzo* (1860); *China* (1877–83); *Atlas von China* (1885); *Methoden der heutigen Geographie* (1886); *Schantung und seine Eingangspforte Kiautschou* (1898); *Ueber Gestaltung und Gliederung einer Grundlinie in der Morphologie Ostasiens* (1900); *Geomorphologische Studien aus Ostasien* (1901). In English he published: *The Comstock Lode* (1865); *Principles of the Natural System of Volcanic Rocks* (1867); *Letters to the Shanghai Chamber of Commerce* (1869–72).

RICH'WOOD. A town in Nicholas Co., W. Va., 150 miles south of Clarksburg, on the Cherry River and on the Baltimore and Ohio Railroad (Map: West Virginia, D 3). It contains two hospitals. There are lumber and paper mills and a tannery. Timber and coal abound in the vicinity. Pop., 1910, 3061.

RICIMER, rĭs'ĭ-mẽr (?–472). A Roman general of the Western Empire. His father was a Suevian chief and his mother a sister of Wallia, King of the Visigoths. He was brought up at the Roman court, rose rapidly in the army, and defeated the Vandals in a naval battle near Corsica and later in a land fight near Agrigentum (456). Soon after this he attacked Avitus, who had been proclaimed Emperor of the West, and defeated him at Piacenza. In 461 he deposed Majorianus and crowned Libius Severus, and, after managing the Empire himself during an interregnum of a year and a half, brought Anthemius to the throne (467). But in 471 he quarreled with Anthemius and, having meanwhile attacked and sacked Rome (472), he deposed the Emperor and installed Olybrius About a month after this Ricimer died of the plague. He had been the real power in Italy for 16 years. Consult *Cambridge Medieval History*, vol. i (New York, 1911).

RICINUS, rĭs'ĭ-nŭs. See CASTOR OIL; CASTOR-OIL PLANT.

RICK'AREES, or **ARICARAS,** à-rē'kà-ràz. See ARIKARA.

RICK'ERT, HEINRICH (1863–). A German philosopher, born at Danzig. He was educated at the universities of Berlin, Zurich, and Strassburg. In 1891 he became a lecturer at Freiburg, where he was promoted to associate professor in 1894 and full professor of philosophy in 1896. According to William James, Rickert holds reality to be whatever agrees with truth, and truth to be that which is founded solely on our primal duty. His publications include: *Zur Lehre von der Definition* (1888); *Der Gegenstand der Erkenntniss* (1892; 3d ed., 1914); *Die Grenzen der naturwissenschaftlichen Begriffsbildung: eine logische Einleitung in die historischen Wissenschaften* (2 vols., 1896–1902; 2d ed., 1913); *Kulturwissenschaft und Naturwissenschaft* (1899; 2d ed., 1910); *Fichtes Atheismusstreit und der kantischen Philosophie* (1899); *Psychophysiologische Kausalität und psychophysiologische Parallellismus* (1900); *Geschichtsphilosophie* (1905; 2d ed., 1907); *Zwei Wege der Erkenntnistheorie* (1909); *Zur Begriff der Philosophie* (1910); *Die Eine, die Einheit, und der Eins* (1911);

Lebenswerte und Kulturwerte (1911); *Urteil und Urteilen* (1912); *Vom System des Wertes* (1913).

RICK'ETS, or **RACHITIS**, rȧ-kī'tĭs (from *wrick*, MDutch *wricken*, Dutch, LG. *wrikken*, to move to and fro). A disease of nutrition, the chief feature of which is an alteration in the growth of the bones by which they become enlarged at their extremities and so soft that they are bent and distorted by muscular action and the weight of the body. It is essentially a disease of children, occurring as a rule between the ages of one and two years. The causes are improper and insufficient food and bad hygienic surroundings. The faults of diet from which infants are likely to develop rickets are: (1) deficient quality of milk from ill health and malnutrition of the nursing mother or unduly prolonged lactation; (2) the substitution for the mother's milk of artificial foods which contain a high percentage of starch and too little fatty and proteid matter.

The symptoms develop gradually and almost imperceptibly. The child is restless at night, and during sleep perspires profusely about the head and neck. It is very sensitive to pressure upon the limbs, often screaming when merely touched. The muscles are soft and flabby, and gastric indigestion and intestinal disturbances set in, accompanied by swelling of the abdomen and colic. Characteristic and remarkable changes in the bones develop. The joints become thickened and nodules form at the junction of the ribs with the costal cartilages, constituting what is called the rosary or beading of the ribs. Defective ossification is also seen in the skull, where the fontanels are large and slow in closing. Dentition is delayed and irregular and the teeth are subject to early decay. As the disease progresses the bones grow softer and various deformities of the head, spine, limbs, chest, and pelvis are brought about by muscular contraction and the superincumbent weight of the body. The child becomes pigeon-breasted and bow-legged (See LEG.) The nervous system may be seriously affected, and rickety children are peculiarly liable to convulsions and to a spasmodic affection of the larynx known as *laryngismus stridulus*.

Rickets is a recoverable disease in the sense that it does not directly cause death and the process of bone softening ceases after a time, although it may have produced permanent deformity. Rickety children are especially prone to severe attacks of bronchitis and bronchopneumonia, by which death is often brought about. The treatment is essentially hygienic and dietetic. The child should be suitably clothed and receive an abundant supply of fresh air and proper food. Starchy materials, for the digestion of which the infant's secretions are not yet prepared, should be excluded from the diet, and cow's milk, to which lime water and a little cream may be added, should constitute the sole food. As the infant approaches the second year, beef juice, chicken broth, or gravy may be added to the dietary, and at a later age a little meat, eggs, and custard may be given. The most valuable medicine is cod-liver oil, given two or three times a day after a meal, in doses proportioned to the child's age. Phosphorus, sirup of the iodide of iron, and preparations of lime such as the lactophosphate are also of value in certain cases. While the bones are soft walking should be discouraged. Deformities of the limbs remaining after the disease is cured may, if extreme, be remedied by surgical procedures.

RICK'ETTS, JAMES BREWERTON (1817–87). An American soldier, born in New York City. He graduated at West Point in 1839, and after receiving his commission as lieutenant of artillery served in the Mexican War. At the outbreak of the Civil War he participated in the defense of Washington and at Bull Run was wounded and taken prisoner. On his release in 1862 he returned to duty with the grade of brigadier general and took part in the second battle of Bull Run. Later he led a division in the northern Virginia, Maryland, and Richmond campaigns, and at Antietam lost a third of his troops. He participated in the Virginia campaign in the spring of 1864, but in July was ordered north to join in the defense of Washington, which was then threatened by General Early, and participated, under Sheridan, in the pursuit of Early through the Shenandoah valley. At Cedar Creek, where he commanded a corps, he received a wound which disabled him for the winter. He was brevetted major general in the regular army in 1865, and from July, 1865, until April, 1866, when he was mustered out of the volunteer service, he commanded a district in Virginia. In 1867 he was retired from the regular service with the rank of major general.

RICKETTS, PALMER CHAMBERLAINE (1856–). An American engineer and educator. He was born at Elkton, Md., and graduated C.E. in 1875 from Rensselaer Polytechnic Institute, where he was thenceforth instructor (1875–82), assistant professor (1882–84), and professor (1884) of technical mechanics, director (1892–1901), and president and director after 1901. In the meantime he served also as a consulting engineer to railroads and other corporations. Besides his contributions to the technical press Ricketts is author of a *History of Rensselaer Polytechnic Institute* (1895; 2d ed., rev., 1914).

RICK'MAN, THOMAS (1776–1841). An English architect and writer on architecture. He was professor of architecture in the Liverpool Academy, and is chiefly known from the fact that in his work, *Attempt to Discriminate the Styles of Architecture in England from the Conquest to the Reformation* (1817), he first gave to the periods of English mediæval architecture the names Norman, Early English, Decorated, and Perpendicular, which have been used ever since. He designed a large number of churches.

RICKSHA, RICKSHAW. See JINRIKISHA.

RICO, rē'kō, MARTIN (c.1850–1908). A Spanish landscape, marine, and figure painter, born in Madrid, where he was a pupil of Federico de Madrazo. He obtained a scholarship enabling him to study in Paris and in Rome, where he spent some time with Fortuny, who chiefly influenced him. While Rico's paintings possess some of his master's sparkle and brilliancy, they lack his richness and depth of color. Many of his best works in oil and water color are in galleries and private collections in America. They include: "Grand Canal, Venice," Metropolitan Museum, New York; "Banks of the Adige," Corcoran Gallery, Washington; "Gathering Oranges, Toledo," and four others in the Walters Gallery, Baltimore; "Plaza and Street, Toledo," Senator Clark's collection, New York.

RICOCHET, rĭk'ō-shā' (of uncertain etymol-

ogy). In military fire tactics this term describes a method of gunfire in which the gun is fired at a low angle and the missile rebounds from the flat surface over which it is traveling. In shelter trenches, rifle pits, redoubts, and other field fortifications, rocks and stones are very carefully covered with earth to avoid the possibility of deflecting the enemy's fire. When spherical projectiles were used in naval guns they were allowed to strike short and ricochet rather than run any risk of going over the enemy, for spherical projectiles are not deflected laterally by striking the surface of water at a low angle nor do they tend to rise after ricochet. Rifled projectiles are sharply deflected upon striking water and they frequently rise from the water surface at an angle very much greater than the striking angle; consequently ricochet is avoided in modern gunfire. See GUNNERY.

RICORD, rĭk'ord, or **RICARD,** rĭk'ard, JOHN. An American lawyer who went to Hawaii in October, 1843, and the next year was appointed Attorney-General of the island kingdom In 1845 the Hawaiian Legislature authorized him to draft a series of acts organizing the five executive departments of the government: Interior, Foreign Affairs, Finance, Public Instruction, and Attorney-General. It also adopted changes in the constitution of 1840 affecting the Privy Council and the judiciary, which he proposed. In 1846 and 1847 it accepted the statute laws that he drew up, and these continued until the revolution to be the basis of Hawaii's civil code. His services in shaping Hawaiian institutions during their formative period were very valuable. He left the islands in 1847.

RICORD, rē'kôr', PHILIPPE (1800–89). A French surgeon, born in Baltimore, Md. He went in 1820 to Paris, where he graduated in medicine in 1826. After practicing in the provinces he returned in 1828 to the capital, where for many years he was surgeon in chief to the hospital for venereal diseases and to the Hôpital du Midi He won a world-wide reputation in his special field. For his suggestions on the cure of varicocele and on the operation of urethroplasty he received in 1842 one of the Montyon prizes. He also demonstrated the difference between gonorrhœa and syphilis. In 1862 he was appointed physician in ordinary to Prince Napoleon and in 1869 consulting surgeon to the Emperor. For his services in the ambulance corps during the siege of Paris he was made Grand Officer of the Legion of Honor in 1871. Among his numerous works are: *De l'emploi du speculum* (1833), in which he describes the speculum invented by him; *De la blennhorrhagie de la femme* (1834); *Du chancre* (1837); *Traité pratique des maladies vénériennes* (1838; 4th ed., 1866; Eng. trans., *A Practical Lecture on Venereal Diseases,* 1842; 13th ed., 1854); *Lettres sur la syphilis* (1851; 3d ed., 1863; Eng. trans., 1853); *Leçons sur le chancre* (1858; 2d ed., 1860; Eng. trans., 1859).

RIDDER, rĭd'ẽr, HERMAN (1851–1915). An American newspaper publisher. He was born and educated in New York City, his parents having been German immigrants. At the age of 11 he became an errand boy, was employed by a life-insurance company two years later, and in 1871 became an insurance agent. He established the *Katholisches Volksblatt* in 1878 and the *Catholic News* in 1886. Ridder became trustee, treasurer, and manager in 1890 and president in 1907 of the New York daily *Staats-Zeitung,* through the columns of which he conducted a pro-German campaign in the United States during the European War. In 1908 he was treasurer of the Democratic National Committee. He became a trustee of the Mutual Life Insurance Company and was a president of the American Newspaper Publishers' Association.

RID'DING, GEORGE (1828–1904). An English bishop and educator, born at Winchester College, of which his father was a fellow. He studied at Balliol College, Oxford (M.A., 1853), and in 1851 became a fellow of Exeter College, where he was a tutor in 1853–63. In the latter year he became second master at Winchester, and in 1867 succeeded his father-in-law, George Moberly, as head master. In 1884 Ridding was appointed the first Bishop of Southwell His publications include: sermons, *The Revel and the Battle* (1897); *Litany of Remembrance* (1905); *Church and Commonwealth* (1906); *Church and State* (1912), the last three edited by his widow.

RID'DLE (AS. *rædels, rædelse,* from *rædan,* to counsel, interpret, read, Goth. *ga-rēdan,* OHG. *rātan,* Ger. *raten,* to counsel: perhaps connected with Lat. *reri,* to think, or with OChurch Slav. *raditi,* to be anxious, Skt. *rādh,* to be successful). The definition in obscure terms of a well-known object which the person addressed is required to name. In modern times the enigma usually makes a witticism or pun, but anciently it had a character more serious. The themes of riddles were often natural objects, like the sun, moon, wind, or rainbow, and the presentation had something of a mythologic character. Knowledge of this sort was considered to imply a measure of wisdom which was in accordance with the early inclination to express truth in a mystical manner rather than in straightforward and simple speech. Thus, Samson, in order to show his intelligence, propounded a riddle to the Philistines. Riddle guessing was often made to form a game, in which one side asked questions and the other side responded; and such contest might be the subject of wagers. According to mythology the stake was often life or honor. Such was the case in the riddle proposed by the Sphinx to Œdipus: "What is that which has four feet in the morning, two at noon, and three at night?" to which the answer was: "Man." Similarly in Old Norse poetry Odin enters into a riddling contest with the giant Vafthrudnir, in which the latter perishes. In the "Alvissmal" the prize of the contest is the daughter of the god Thor. Of these contests we have a survival in the English ballad of the elfin knight, where a maid saves herself from an evil spirit by guessing his riddles.

RIDDLE, ALBERT GALLATIN (1816–1902). An American lawyer and author, born at Monson, Mass. He was taken by his parents in 1817 to Geauga Co., Ohio, where he was educated in the common schools. Admitted to the bar in 1840, he served in the State Legislature in 1848–49. In 1848 he called together the first convention of Free-Soilers in Ohio. In 1859 he defended the Oberlin slave rescuers, and in 1861–63 was in Congress as a Republican. In 1864 he removed to Washington, and was afterward engaged by the State Department to assist in prosecuting John H. Surratt for his part in the assassination of President Lincoln. In 1877 he was appointed law officer of the District of

Columbia. For a time Riddle was head of the law department at Howard University, Washington. He wrote several stories of early Ohio life, such as *Bart Ridgely* (1873) and *The Sugar-Makers of the West Woods* (1885); a *Life of Benjamin F. Wade; Recollections of War Times, 1860–65.*

RIDDLE, MATTHEW BROWN (1836–1916). An American theologian, born in Pittsburgh. After his graduation at Jefferson (now Washington and Jefferson) College, Pennsylvania, in 1852, he studied at the Western and New Brunswick theological seminaries until 1859 and then went to Heidelberg. He was adjunct professor of Greek in Jefferson College (1857–58), pastor of Dutch Reformed churches in New Jersey (1862–69) professor in Hartford Theological Seminary (1871–87), and professor of New Testament exegesis and then of New Testament criticism in the Western Theological Seminary, Allegheny, Pa. He was a member of the American Committee for New Testament Revision, was also a reviser of the Westminster Confession of Faith, prepared *Notes on the International Sunday-School Lessons* (1877–81), and did much editorial work.

RIDEAL, rī-dēl′, SAMUEL (1863–). An English chemist, born in Brixton. He was educated at Dulwich College, at the Royal School of Mines, and at University College, London, where he became assistant in the chemical laboratory and fellow in 1887. He became well known as an expert on water and sewage purification, a subject which he took in 1902 for the Cantor lectures, delivered before the Society of Arts. Rideal wrote: *Practical Organic Chemistry* (1889; 2d ed., 1898); *Disinfection and Disinfectants* (1895; 3d ed., 1904); *Water and its Purification* (1897; 2d ed., 1902); *Sewage and the Bacterial Purification of Sewage* (1900; 3d ed., 1906); *Glue and Glue Testing* (1900; 2d ed., 1914); *Water Supplies: Their Purification, Filtration, and Sterilization* (1914), with Eric K. Rideal

RIDEAU, rē′dō′. A waterway formed by the lake, river, and canal of the same name in the Province of Ontario, Canada (Map: Ontario, J 4). The lake is situated from 42 to 60 miles south-southwest of Ottawa and is drained by the Rideau River, which falls into the Ottawa River at the city of Ottawa. The canal, built between 1826 and 1834 for military purposes, connects Ottawa with Kingston on Lake Ontario by way of the river and lake and by connections with Mud Lake and the Cataraqui River. It is 126¼ miles long, has a navigable depth of 4½ feet and 47 locks. Its importance has declined since the advent of railways.

RIDEING, rīd′ing, WILLIAM HENRY (1853–). An American journalist and writer, born in Liverpool, England. After coming to the United States in 1869 he was at various times on the staff of papers in Newark, Boston, Springfield, and New York. In 1881 he became associate editor of the *Youth's Companion.* In addition he was also editor of the London *Dramatic Notes* (1881–82) and from 1888 to 1899 associate and managing editor of the *North American Review.* His publications include: *A-Saddle in the Wild West* (1879); *Stray Moments with Thackeray* (1880); *Boys in the Mountains* (1882); *Boys Coastwise* (1884); *Thackeray's London* (1885); *The Boyhood of Living Authors* (1887; new ed., *The Boyhood of Famous Authors,* 1908); *In the Land of Lorna Doone* (1895); *At Hawarden with Mr. Gladstone and Other Transatlantic Experiences* (1896); *How Tyson Came Home* (1904); *Many Celebrities and a Few Others* (1911), reminiscences.

RIDER. An American political term denoting a legislative measure which, if left to stand alone, is likely to be rejected by the other branch of the Legislature or vetoed by the Executive, but in order to be carried through is attached to an appropriation or other bill whose enactment is assured. The practice is an encroachment upon the independence of the executive, especially in the case of the President, who is not allowed to veto parts of an appropriation bill. A rule of the United States House of Representatives in 1888–89 prohibited the tacking of riders to appropriation bills.

RIDGAWAY, rīj′ä-wā, HENRY BASCOM (1830–95). An American Methodist Episcopal minister and educator, born in Talbot Co., Md., and educated at Dickinson College. After holding various pastorates he was appointed in 1882 professor in the Garrett Biblical Institute (Evanston, Ill.), of which he became president two years afterward. He published biographies of *Alfred Cookman* (1871); *Bishop Edmund S. Janes* (1882); *Bishop Beverly Waugh* (1883); *Bishop Matthew Simpson* (1885); also, *The Lord's Land* (1876).

RIDGE, MAJOR (c.1770–1839). A noted Cherokee chief, born at Hiwassee town, near the present Columbus, in east Tennessee. Having been formally initiated as a warrior at the age of 12, he took an active part in the border warfare along the Tennessee frontier. Shortly after 1794 he was elected to a seat in the tribal council. He opposed cessions of tribal territory in 1804 and 1805, and took a firm stand against the doctrines of the Shawano prophet, who preached resistance to the government. In the Creek War of 1813–14 he led a detachment of Cherokee volunteers to the aid of General Jackson and rendered effective service, whence he was called Major. Together with 19 others he signed the Treaty of New Echota, in 1835, which bound the entire Cherokee nation to remove beyond the Mississippi. The treaty was opposed by John Ross and by the entire Cherokee council, but notwithstanding repeated protest it was carried through, and the entire tribe was deported to the Indian Territory, losing nearly 4000 by death on the journey, which occupied all the winter of 1838–39. On June 22, 1839, a few months after their arrival, Major Ridge, his son John, and Elias Boudinot, three principal signers of the treaty, were killed at their homes by men sent for the purpose, in accordance with an old Cherokee law which fixed the death penalty for attempting to sell tribal lands without the consent of the entire nation.

RIDGE, WILLIAM PETT (c.1860–). An English novelist, born at Chatham, near Canterbury, and educated in the Birkbeck Institution. He is best known for his humorous stories of lower-class life. His books include: *A Clever Wife* (1895); *Secretary to Bayne, M. P.* (1897); *Mord Em'ly* (1898); *A Breaker of the Laws* (1900); *Lost Property* (1902); *The Wickhamses* (1906); *Thanks to Sanderson* (1911); *The Remington Sentence* (1913); *The Happy Recruit* (1914); *The Kennedy People* (1915).

RIDGE'FIELD. A town in Fairfield Co., Conn., 16 miles by rail south of Danbury, on the New York, New Haven, and Hartford Rail-

road (Map: Connecticut, B 4). It is essentially a residential place and summer resort, containing beautiful homes of many New Yorkers. There is a tablet commemorating the battle fought here between the Continental soldiers and a British marauding party in April, 1777. Pop., 1900, 2626; 1910, 3118.

RIDGE'WAY, WILLIAM (1853–). A British archæologist. He was born in King's County, Ireland, and was educated at Trinity College, Dublin, and at Cambridge. In 1883 he accepted the chair of Greek at Queen's College, Cork, and in 1892 that of archæology at Cambridge, where he became a fellow of Gonville and Caius. He was Gifford lecturer in natural religion at Aberdeen (1909–11), Stokes lecturer in Irish archæology at Dublin (1909), Hermione lecturer in art at Dublin (1911), and president of the Royal Anthropological Institute (1908–10) and of the anthropological section of the British Association (1908). Among his varied and valuable writings are: *Origin of Metallic Currency and Weights Standards* (1892); *The Early Age of Greece* (1901), in which he argues that the Homeric Achæans came from central Europe, where the Iron age had dawned as early as 2000 B.C., and that the Homeric or Achæan period was later than the Mycenæan (or Pelasgian); *The Origin and Influence of the Thoroughbred Horse* (1905)—he believes it came from North Africa; *Who Were the Romans?* (1907), an attempt to prove the Sabine origin of the patricians; *The Oldest Irish Epic* (1907); *The Origin of Tragedy* (1910); *Minos the Destroyer* (1910).

RIDGE'WOOD. A village in Bergen Co., N. J., 5 miles northeast of Paterson and 22 miles northwest of New York, N. Y., on the Erie Railroad (Map: New Jersey, D 2). The village has good schools It is wholly a residential place. Pop., 1900, 3298; 1910, 5416; 1915 (State census), 6729.

RIDG'WAY. A borough and the county seat of Elk Co., Pa., 119 miles east by south of Erie, on the Clarion River and on the Pennsylvania and the Buffalo, Rochester, and Pittsburgh railroads (Map: Pennsylvania, D 3). The courthouse and high school are noteworthy buildings. There are a public hospital and a fine Y. M. C. A. Ridgway is the centre of a lumbering district, and is interested chiefly in manufacturing leather, iron, clay, and lumber products, silk goods, railroad snow plows, dynamos, and machine tools. Coal and natural gas abound in the vicinity. Pop, 1900, 3515; 1910, 5408.

RIDGWAY, ROBERT (1850–). An American ornithologist, born at Mount Carmel, Ill. He was zoölogist on the United States geological exploration of the fortieth parallel, under Clarence King, in 1867–69. In 1880 he was appointed curator of the division of birds in the United States National Museum at Washington, and he became one of the founders and in 1898–1900 was president of the American Ornithologists' Union. He collaborated with Baird and Brewer in *A History of North American Birds* (3 vols., 1875) and in *The Water Birds of North America* (1884). His other publications include: *A Nomenclature of Colors for Naturalists* (1886); *A Manual of North American Birds* (1887; 2d ed., 1896); *The Birds of North and Middle America* (5 vols., 1901–11); *Color Standards and Color Nomenclature* (1912).

RIDING. See HORSEMANSHIP.

RID'ING (from Icel. *þriðjungr*, third part, from *þriði*, third, from *þrīr*, three; the loss of the initial *th* is due to the faulty division of *North-thriding*, *South-thriding* as *North-riding*, *South-riding*), or TRITHING. A term applied to the administrative districts into which Yorkshire, England, is divided, termed respectively East, West, and North Riding. Other counties besides York had and still have subdivisions other than the common hundred. In Kent the hundreds are grouped together in lathes or lests, and in Sussex in rapes. Lincolnshire, England, and Long Island, in America, were formerly divided into ridings. Consult William Stubbs, *Constitutional History of England*, vol. i (6th ed., Oxford, 1897).

RIDINGER, rē'dĭng-ĕr, JOHANN ELIAS (1698–1767). A German animal draftsman, etcher, and painter. He was born at Ulm and studied there under Christoph Resch and Johann Falk and then under Rugendas in Augsburg, where he was appointed director of the academy in 1759. His hunting scenes and delineations of animals were in great demand. In them he displays imagination and profound knowledge of animals, but they are more interesting from the standpoint of natural history or the chase than from that of art. His oil paintings are very rare and he is best known through his drawings, etchings, and engravings, a complete list and description of which may be found in the artist's *Life* by Thienemann (with three supplements, Leipzig, 1856–76).

RID'LEY, NICHOLAS (c.1500–55). Bishop of London and one of the leading English reformers. He was educated at Pembroke Hall, Cambridge, at the Sorbonne, Paris, and at Louvain. He came under the notice of Archbishop Cranmer and received various appointments from him. After 1536, the year of the death of his uncle Robert, who had paid the expenses of his education and who was an orthodox Roman Catholic, Ridley openly espoused the reformed faith. By the end of the reign of Henry VIII he had renounced his belief in the doctrine of transubstantiation, and he influenced Cranmer in the same direction. He was named Bishop of Rochester in 1547. He took part in the depositions of Bishops Bonner and Gardiner, and himself became in 1550 Bonner's successor as Bishop of London. He also took part in the first revision of the Prayer Book in 1548, and assisted in drawing up the 41 articles, afterward reduced to 39. On the death of Edward VI he warmly espoused the cause of Lady Jane Grey (q.v.), but when this proved a speedy failure he was compelled to submit to Queen Mary. Ridley was at once committed to the Tower, and though every opportunity was given him to recant, he refused. In 1554 he was removed to Oxford for trial, found guilty in 1555 of the capital offense of heresy, and on Oct. 16, 1555, he was burnt at the stake, together with Latimer, in front of Balliol College. Ridley's *Works*, which are chiefly polemical, have been published, together with a *Life*, by Henry Christmas, for the Packer Society (London, 1841).

RID'PATH, JOHN CLARK (1841–1900). An American historian and educator, born in Putnam Co., Ind. He graduated in 1859 at Asbury (now De Pauw) University, where he became professor of English literature (1869), of belles-lettres and history (1871), and vice president (1881). He resigned in 1885. His writings consist largely of popular presentations of

American history. Revisions or later editions of two of his works appeared as *New Complete History of the United States* (12 vols., 1911) and *Ridpath's History of the World* (9 vols., 1913). He also published biographies of James Otis, James A. Garfield, and James G. Blaine, and wrote verse and monographs on monetary subjects, and he served as editor in chief of a *Library of Universal Literature* (25 vols., 1898).

RIEBECKITE, rē'bĕk-īt (named in honor of Emil *Riebeck*, a German traveler of the nineteenth century). One of the numerous varieties of amphibole. It is a sodium-iron silicate crystallizing in the monoclinic system, has a vitreous lustre, and is black in color. It occurs among the older rocks, such as granite and syenite, especially on the island of Socotra, in the Indian Ocean.

RIECKE, rēk'e, EDUARD (1845–). A German physicist. He was born in Stuttgart, was educated at the Technical High School there, where he studied mining, and at Tübingen and Göttingen, where he devoted himself to mathematics and physics. He served as a lieutenant during the Franco-Prussian War and in 1871 became a docent and in 1873 professor of experimental physics at the University of Göttingen. He did important work in various fields of physics, particularly electricity, heat, and hydrodynamics, for which he received an honorary degree in science from Cambridge University. His great publication was his *Lehrbuch der Physik* (1896; 5th ed., 1912), of which there is a Japanese version. He was an editor of the *Physikalische Zeitschrift* (Leipzig, 1899 et seq.).

RIEDEL, rē'dĕl, KARL (1827–88). A German musician. He was born at Kronenberg, near Elberfeld, studied at Krefeld with Karl Wilhelm, and entered the conservatory at Leipzig, in which he became a teacher of piano and theory. In 1854 he established a society for the performance of ancient Church music which became famous as the Riedel-Verein under his leadership and that of Kretschmar. Upon the death of Brendel, Riedel became president of the Allgemeiner deutscher Musikverein. His compositions, mostly chorales for male voices, are vigorous and original; but his real claim to fame rests on his gift of organization, his thoroughness, and especially his masterly editing of such old works as those of Prätorius, Schütz, Franck, and Eccard.

RIEDESEL, rē-dā'zel, FRIEDRICH ADOLPH, BARON (1738–1800). A German soldier in America, born at Lauterbach, Hesse. He studied at Marburg, served under Prince Ferdinand of Brunswick during the Seven Years' War, and in 1776 took command of 4000 Brunswick troops hired by Great Britain for service against the American Colonies. He landed at Quebec in June, joined Burgoyne's expedition, fought bravely at the first battle of Saratoga (Sept. 19, 1777), and surrendered with his commander (October 17). He remained a prisoner for over two years, together with his wife. He was exchanged in 1780, put in command of the British forces on Long Island, and returned to Germany in 1783. He was made a lieutenant general in 1787, and commanded the Brunswickers in Holland.—His wife, FRIEDERIKE CHARLOTTE LUISE (1746–1808), left an interesting account of their American adventures. The *Memoirs, Letters, and Journals of Major-General Riedesel during his Residence in America* (Albany, 1868) and *Letters and Journals* by Lady Riedesel (ib., 1867), both translated and edited by Stone, are among the most valuable material for the history of Burgoyne's campaign.

RIEFSTAHL, rēf'stäl, WILHELM (1827–88). A German landscape, genre, and architectural painter, born at Neustrelitz, Mecklenburg. He was a pupil of Wilhelm Schirmer at the Berlin Academy, and subsequently traveled in Rügen, Westphalia, the Rhine country, and Switzerland, whence he took the landscape settings for his genre scenes. These are rather ponderous, but are good in color and are conscientiously painted in a manner typically German. Good examples are: "Devotions of Passeier Shepherds in the Fields" (1864, gold medal, Berlin), "All Souls' Day at Bregenz" (1869), and "Child's Funeral," all in the National Gallery, Berlin, and "Wedding Procession in Bavarian Alps" (1866), in the Metropolitan Museum, New York. He also painted Italian scenes with architectural backgrounds, such as "Funeral Procession in Front of the Pantheon" (1871), Dresden Museum. Riefstahl was director of the Karlsruhe Art School (1875–77), and then removed to Munich.

RIEGER, rē'gĕr, FRANZ LADISLAUS, BARON VON (1818–1903). A Bohemian statesman, born at Semil and educated for the bar at Prague. He entered the government service. Prosecution for political ideas increased his popularity, and in 1848 seven districts elected him deputy. He became one of the leaders of the Slavic party in the Austrian Reichsrat. During the reactionary period which followed the revolution he took no further part of importance in politics until 1860. In the meantime he occupied himself with the pen as a political weapon, writing *Slavcs d'Autriche* (1860), and with Kober founding the Bohemian encyclopædia, *Slownik naučny* (1859–74). In 1861, with his father-in-law, the historian Palacky, he became a leader of the Czech National party, both as a member of the Bohemian Diet and as a deputy to the Vienna Reichsrat. In 1863 he dictated the policy of abstention, by which the Reichsrat was left without a Czech representation, and he thenceforth led, with the aid of the Ultramontanes and Feudalists, the agitation for Bohemian autonomy. During the Taaffe régime, after the Czechs had reëntered the Reichsrat, Rieger supported the government and became the head of the Old Czechs. His conservatism alienated the more radical wing of the National party (Young Czechs), who gradually gained supremacy, both in the Bohemian Diet and the Austrian Reichsrat. In 1897 he was made Baron and called into the Austrian House of Peers.

RIEGER, URBAN. See RHEGIUS, URBANUS.

RIEGO Y NÚÑEZ, rē-ā'gō ē nōō'nyāth, RAFAEL DEL (1785–1823). A Spanish revolutionist, born at Oviedo in Asturias. He joined in the patriot movement against France which followed the usurpation of the Spanish throne by Joseph Bonaparte. Captured by the French, he was a prisoner until 1814, when he visited Germany and England. He was leader of the military insurrection which broke out in January, 1820, and which brought about the restoration of the Spanish constitution of 1812. He became field marshal and captain general of Aragon, and in 1823 was president of the Cortes. He ardently opposed French intervention, met the soldiers of the Holy Alliance at the head

of the Army of Malaga, was wounded, taken prisoner, and handed over to the royal authorities. He was tried as a traitor and put to death at Madrid, Nov. 7, 1823. A hymn, written by Riego's fellow prisoner in France, Colonel Reart, of the Walloon Guards, but called the "Hymn of Riego," became a popular revolutionary song and is now one of the national anthems. Consult Riego, *Memoirs of Riego and his Family* (London, 1824), and Nard and Piral, *Vida militar y política de Riego* (Madrid, 1844).

RIEHL, rēl, ALOIS (1844–). A German philosopher, born at Bozen, Tirol. He studied at Vienna, Innsbruck, and Munich, and was appointed professor of philosophy at Graz in 1878. Afterward he held similar chairs at Freiburg, Kiel, and Halle. He belongs to the German group of positivists. Riehl is well known as a logician, as a critic of modern English logic, and as author of *Beitrage zur Logik* (1892; 2d ed., 1912). His philosophical criticism is to be found in *Der philosophische Kritizismus* (1876–87; 2d ed., 1908); *Moral und Dogma* (1871); *Ueber wissenschaftliche und nichtwissenschaftliche Philosophie* (1883); *Giordano Bruno* (1889; 2d ed., 1900); *Friedrich Nietzsche* (1897; 4th ed., 1905); *Zur Einfuhrung in die Philosophie der Gegenwart* (1903; 2d ed., 1904); *Kultur der Gegenwart* (1906); *Fichtes Universitatsplan* (1910).

RIEHL, WILHELM HEINRICH (1823–97). A German historian of civilization and novelist, born at Biebrich and educated at Marburg, Tübingen, Bonn, and Giessen. In 1846 he entered journalism on the staff of the *Karlsruher Zeitung*, then founded the *Badischer Landtagsbote*, and after his election to the German National Assembly in 1848 edited the *Nassauische allgemeine Zeitung*. In 1854 he went to Munich as professor of economics, and five years afterward was transferred to a chair of history of literature. He is better known as the author of valuable works on the history of civilization and of novels and tales based on these same historical studies, but of much literary excellence, especially in the short story. Riehl's works include: *Naturgeschichte des Volkes* (1851–69; in many editions); *Die Pfalzer* (1857); *Kulturstudien aus drei Jahrhunderten* (1859; 5th ed., 1896); *Musikalische Charakterkopfe* (1853–77); *Aus der Ecke* (1875; 3d ed., 1890); *Lebensratsel* (1888); *Religiose Studien eines Weltkindes* (1894); and posthumously a romance, *Ein ganzer Mann* (1897).

RIEHM, rēm, EDUARD KARL AUGUST (1830–88). A German Protestant theologian. He was born at Diersburg, Baden, studied at Heidelberg and Halle, and in 1853 became a vicar at Durlach. In the following year he was appointed garrison preacher at Mannheim. A lecturer at Heidelberg from 1858, he became professor there in 1861, and in the following year took up the same duties at Halle. His publications include: *Die Gesetzgebung Mosis im Lande Moab* (1854); *Der Lehrbegriff des Hebraerbriefs* (1858–59; 2d ed., 1867); *Die besondere Bedeutung des alten Testaments fur die religiose Erkenntnis* (1864); *Hermann Hupfeld* (1867); *Die messianische Weissagung* (1875; 2d ed., 1883; Eng. trans., 1890); *Der Begriff der Suhne im alten Testament* (1877); *Der biblische Schöpfungsbericht* (1881); *Zur Revision der Lutherbibel* (1882); *Handworterbuch des biblischen Altertums* (2 vols., 1884; 2d ed., 1892–94); *Einleitung in das alte Testament* (1889); *Alttestamentliche Theologie* (1889).

RIEKA, rē-yä'kä. See FIUME.

RIEL, rē-ĕl', LOUIS (1844–85). Leader of the so-called Riel's Rebellion in Canada. He was born at St. Boniface, Manitoba, Oct. 23, 1844, and was of Indian and French-Canadian descent. He is said to have been educated for the priesthood in a Roman Catholic seminary at Quebec, but he did not take orders. He first came into prominence as the leader of the rebellion that broke out in 1869. In that year upon the purchase of the Northwest Territory from the Hudson's Bay Company by the Canadian government the metis, or half-breeds, of that section became alarmed lest they should lose some of their rights and especially the title to their lands, and formed a council to insist upon their claims. Of this council Riel was secretary and John Bruce president, but Riel was the actual leader of the movement. On November 2 the malcontents refused to allow William McDougall, who had been appointed Lieutenant Governor, to enter the Territory, and on the same day Riel took possession of Fort Garry. The council then issued a proclamation to the settlers, calling upon them to send representatives to a convention, which on December 1 issued a Bill of Rights and later formed a provisional government, of which Riel became President. A considerable number of persons who opposed the new government were seized and imprisoned, and by Riel's order one of these, named Thomas Scott, was executed. Attempts at a peaceful settlement of the difficulties having failed, the Dominion government determined to put down the rebellion by force of arms. Accordingly in the summer of 1870 Colonel Wolseley (afterward Sir Garnet Wolseley, commander in chief of the British army) was dispatched with a force of about 1400 men to the seat of trouble. Finding resistance hopeless, with some of his associates Riel fled to the United States, where he remained for some time. In 1873 and again in 1874 his friends elected him to the Dominion Parliament for the district of Provencher, and in the latter year, despite the fact that a reward of $5000 had been offered for his capture, he attempted to take his seat, but was expelled, and in October a warrant of outlawry was issued against him. In 1877 he was confined for a time in a lunatic asylum in Quebec, but the next year he was again at large and is thought by some to have entered into a conspiracy with the Fenians for the conquest of the Northwest. Later he went to Montana, whence in 1884 he was invited by French half-breeds living near the forks of the Saskatchewan to come and assist them in forcing the government to settle their claims to certain land grants and to give them certain other rights. Riel accepted their invitation, and in the following March was made President of the provisional government, which was established at St. Laurent. Troops, however, were dispatched against the rebels, and the main stronghold at Batoche was taken by General Middleton. Riel himself was soon afterward captured, and in July was brought to trial at Regina for high treason. His lawyers pleaded in his defense that he was insane, and this plea was to a certain extent borne out by peculiar religious ideas that he had announced; but he was nevertheless condemned to death and on

Nov. 16, 1885, was hanged. Consult Alexander Begg, *History of the Red River Troubles* (Toronto, 1871), and id., *History of the Northwest* (ib., 1895).

RIEMANN, rē'mȧn, GEORG FRIEDRICH BERNHARD (1826–66). One of the foremost German mathematicians of the nineteenth century, particularly in the field of geometry. He was born at Breselenz, near Dannenberg, in Hanover. He studied mathematics at Göttingen and Berlin and received his doctor's degree at the former university in 1851, his thesis being a well-known contribution to the theory of functions, *Grundlagen fur allgemeine Theorie der Funktionen einer veranderlichen complexen Grösse.* Three years later he was made privatdocent at Göttingen, then (1857) adjunct professor, and finally (1859), on the death of Dirichlet, full professor. His introduction of the notion of geometric order into the theory of Abelian functions and his invention of the surfaces which bear his name led to great and rapid advance in the function theory. To him is due also (1854) a new system of non-Euclidean geometry, ranking with that of Lobatchevsky and Bolyai (see GEOMETRY), a system which he made known in his thesis *Ueber die Hypothesen, welche der Geometrie zu Grunde liegen* (published posthumously, Leipzig, 1867). Riemann's writings, besides those already mentioned, are: *Vorlesungen über Schwere, Elektrizitat und Magnetismus* (1876; 2d ed., 1880; both posthumous); *Partielle Differentialgleichungen* (1869; 4th ed., 1900–01; both posthumous); *Mechanik des Ohres; Elliptische Functionen, Vorlesungen mit Zusatzen* (1899); and his *Gesammelte mathematische Werke und wissenschaftlicher Nachlass,* edited by H. Weber and Dedekind (1876; 2d ed., 1892; Fr. trans., 1898). He also contributed several memoirs on surfaces, which were published in the *Annalen* and in *Crelle's Journal.* For the life of Riemann, consult his *Gesammelte mathematische Werke* (Leipzig, 1902) and Ernst Schering, *Bernhard Riemann, zum Gedachtniss* (Göttingen, 1867); for an elementary explanation of Riemann's surfaces, consult H. Durège, *Elements of the Theory of Functions,* English translation by Fisher and Schwatt (New York, 1901), and Gustav Holzmüller, *Einfuhrung in die Theorie der isogonalen Verwandtschaften und der Conformal-Abbildungen* (Leipzig, 1882).

RIEMANN, HUGO (1849–). A German writer on music, born at Grossmehlra, near Sondershausen. He was educated in musical theory by Frankenberger and studied the piano with Barthel and Ratzenberger. He also studied law, philosophy, and history. After serving in the Franco-German War he entered the Leipzig Conservatory. Both as conductor and as teacher at Bielefeld he was notably active until 1878, when he became university lecturer on music at Leipzig. As the much desired appointment at the conservatory did not follow, he went to Bromberg in 1880 as teacher of music, and from 1881 to 1890 he was teacher at the Hamburg Conservatory. After a short period at the Sondershausen Conservatory he went in 1890 to the conservatory at Wiesbaden. Near the close of 1895 he returned to Leipzig as lecturer at the university. In 1901 he became professor and in 1908 director of the newly established Collegium Musicum. His activity in all fields of musical research was amazing, yet he was no mere compiler, but a profound original investigator, and in the field of harmony and phrasing a true reformer, whose ideas are now generally accepted. His *Musiklexicon,* first published in 1882 and revised every few years (8th ed., 1916), has been translated into every civilized language and is a standard authority. Among his other works the most important are: *Handbuch der Harmonielehre* (1887); *Geschichte der Musiktheorie im 9.–19. Jahrhundert* (1898); *Geschichte der Musik seit Beethoven* (1901); *Handbuch der Musikgeschichte* (4 vols., 1901–14); *Grosse Kompositionslehre* (3 vols., 1902–03). He edited numerous older works and modern piano works with phrasings according to his system.

RIEMENSCHNEIDER, rē'men-shnī'dĕr, TILMAN, called MEISTER DILL (TILL) (1468–1531). One of the chief German sculptors of the Renaissance. He was born at Osterode, in the Harz Mountains. It is not known where or under whom he studied, but his work certainly shows the influence of Schongauer and probably of Syrlin. In 1483 he appears at Wurzburg as a journeyman carver, in 1485 as a citizen, in 1505–07 as city architect; in 1509 he was chosen one of the three members of the upper council and in 1520 burgomaster. During the religious troubles of the following years Riemenschneider was one of the leaders of the reforming element which sided with the peasants during the Peasant War. After the definite victory of the Bishop of Würzburg over the peasants in 1525 he was imprisoned, tortured on the rack, and expelled from the council, and from this time until his death in 1531 he lived in retirement. His principal works in stone include the monument to Eberhard of Grumbach, in the church of Rimpar (near Würzburg); "Adam and Eve" (1493), on the south portal of the Liebfrauenkirche at Würzburg, and the statues of Christ, John the Baptist, and the Apostles on the buttresses of the same church (1500–06); a madonna and the tomb of John Trithemius in the Neumünsterkirche (1493); the portrait statues of the Bishops Rudolf of Scheerenburg and Lorenz von Bibra in the cathedral. His masterpiece is the monument to the Emperor Henry II and his wife Kunigunde in Bamberg Cathedral (1495–1513). Other well-known works are the "Bewailing of the Body of Christ" (1508), a group in the church of Heidingsfeld, and his last work (1525), a high relief of the same subject in the church of Maidbrunn.

Outside of his native land Riemenschneider is most widely known for his wood carvings, many of which were executed after his designs by his numerous pupils and followers. This was particularly the case in his last years. Chief among them are a series of large altars with reliefs and figures: the altars of the San Grail and the Virgin in St. Jakob, Rothenburg, and two others in the Marienkapelle; those at Creglingen, Detwang, Heilbronn, and Bibra, in the National Museum, Munich, and the Germanic Museum, Nuremberg; besides a remarkable polychrome madonna in a rosary in the Pilgrims' Chapel near Volkach. In the Altman collection, Metropolitan Museum, New York, is his "Bust of a Young Man." Although Riemenschneider's art lacks virility and dramatic power, it nevertheless charms by its sincerity and spirituality. The figures are slender, with drooping shoulders and stooping attitudes; the

costume is contemporary, with draperies and proportions not always correctly treated.

Bibliography. The best monograph on Riemenschneider is by Eduard Tönnies (Strassburg, 1900); others are by A. Weber (Würzburg, 1888) and Streit (Berlin, 1888), with heliotypes of all his works.

RIEMER, rē'mēr, FRIEDRICH WILHELM (1774–1845). A German scholar and literary historian, born at Glatz. He studied theology and philology at Halle, was a tutor in the family of Wilhelm von Humboldt (1801–03), and then for nine years lived with Goethe as his literary assistant and his son's tutor. In 1812 he became professor at the Weimar Gymnasium, from 1814 to 1820 he was assistant librarian, and from 1837 to his death he was librarian in chief at Weimar. Riemer published some mediocre poetry and a Greek lexicon (1802–04), but is best known for his contributions to Goethe literature: *Mittcilungen uber Goethe* (1841), his edition of Goethe's correspondence with Zelter (1833–34), and his own letters published in two volumes called *Briefe von und an Goethe* (1846) and in *Aus dem Goethehause* (1892, edited by Heitmüller).

RIENZI, rē-ĕn'zē, COLA DI (c.1313–54). A Roman popular leader. He was born at Rome, son of a tavern keeper. Until his twentieth year he lived among the peasants of Anagni; then he returned to his native city, where he studied grammar and rhetoric and read the Latin classics. The assassination of his brother by a Roman noble finally determined him to deliver the city from the barons. He assumed the significant title of consul of orphans, widows, and the poor. In 1343 he was appointed by the heads of the Guelph party spokesman or orator of a deputation sent to the papal court at Avignon to beseech Clement VI to return to Rome in order to protect the citizens from the tyranny of their oppressors. Here he formed a close friendship with Petrarch, through whose assistance he obtained a favorable hearing from his Holiness, who appointed him notary to the city chamber. In April, 1344, Rienzi returned to Rome; but reform, he found, was impossible without revolution. During three years he loudly and openly menaced the nobles, who, thinking him mad, took no steps to crush him. At last on May 20, 1347, surrounded by 100 horsemen and accompanied by the Papal Legate, Rienzi delivered a magnificent discourse to a gathering of the people on the Capitol, and proposed a series of laws for the better government of the community, which were unanimously approved. The aristocratic Senators were quickly driven out of the city, and then Rienzi took the title of tribune of liberty, peace, and justice and chose the Papal Legate for his colleague.

Rienzi dispatched messengers to the various Italian states, requesting them to send deputies to Rome to consult for the general interests of the peninsula and to devise measures for its unification. These messengers were everywhere received with enthusiasm, and on Aug. 1, 1347, 200 deputies assembled in the Lateran Church, in Rome, where Rienzi declared that the choice of an Emperor of the Holy Roman Empire belonged to the Roman people, and summoned Louis the Bavarian and Charles of Luxemburg, who were then disputants for the dignity, to appear before him. The Pope was indignant at the transference of authority from himself to his subjects; the people groaned under the heavy taxes necessary to support the cost of Rienzi's government; and the barons gathered together their forces and renewed their devastations. After ineffectual resistance Rienzi resigned his functions and withdrew from Rome, in December, after but seven months of power. In the solitudes of the Neapolitan Apennines Rienzi joined an order of Franciscan hermits and spent nearly two years in exercises of piety and penitence. Ambition made him readily listen to a brother-monk who declared that Rienzi was destined, by the help of the Emperor Charles IV, at Prague, to introduce a new era of happiness into the world. Rienzi went at once to Prague and announced to the Emperor that in a year and a half a new hierarchy would be established in the Church and under a new Pope Charles would reign in the west and Rienzi in the east. Charles put the prophet in prison, and then informed the Pope of the matter. In July, 1351, Rienzi was transferred to Avignon, where proceedings were opened against him, and he was condemned to death in August, 1352, but his life was spared and the next two years were spent in easy confinement in the French papal city.

Meanwhile at Rome the great families were more factious, more anarchical, more desperately fond of spilling blood than ever; and at last Innocent VI sent Cardinal Albornoz to reestablish order. Since the Pope thought Rienzi might help to accomplish this purpose, Rienzi was released from prison and accompanied the Cardinal to Rome. In August, 1354, having borrowed money and raised a small body of soldiers, he made a sort of triumphal entry into Rome and was received with universal acclamations. But misfortune had debased his character; he abandoned himself to good living, and his once generous sentiments had given place to a hard, mistrustful, and cruel disposition. The barons refused to recognize his government and fortified themselves in their castles. The war against them necessitated the incurring of heavy expenses. In two months, Rienzi's rule becoming intolerable, an infuriated crowd surrounded him in the Capitol and put him to death. Consult: Felix Papencordt, *Cola di Rienzo und seine Zeit* (Hamburg, 1841); Auriac, *Etude historique sur Nicole Rienzo* (Amiens, 1885); Emmanuel Rodocanachi, *Cola di Rienzo* (Paris, 1888); Ferdinand Gregorovius, *History of the City of Rome in the Middle Ages*, vol. vi (Eng. trans. by A. Hamilton, London, 1898); Gabriele d'Annunzio, *La vita di Cola di Rienzo* (Milan, 1913).

RIENZI, DER LETZTE DER TRIBUNEN. An opera by Richard Wagner (q.v.), first produced at Dresden, Oct. 20, 1842; in the United States, Feb. 5, 1886 (New York).

RIES, rēs, HEINRICH (1871–). An American economic geologist, born in Brooklyn, N. Y. He was educated at Columbia University (Ph.B., 1892; Ph.D., 1896), where he was an assistant in mineralogy in 1896–97, and at the University of Berlin (1897–98). At Cornell he served as instructor (1898–1902), as assistant professor (1902–05), and thereafter as professor of economic geology, becoming head of the geological department in 1915. In 1915–16 he lectured at Columbia. He was also a member of juries of awards at various American expositions. Ries was a contributor to the *International Year Book* and to the NEW INTERNATIONAL ENCYCLO-

PÆDIA. His publications include: *Economic Geology of the United States* (1905; 3d ed., rev., 1911); *Clays of Texas* (1908); *Clays: Their Occurrence, Properties, and Uses* (1906; 2d ed., 1908); *History of Clay-Working Industry in the United States* (1909), with Henry Leighton; *Building Stones and Clay Products* (1912); *Engineering Geology* (1914; 2d ed., rev., 1915), with T. L. Watson; also numerous reports on clay published by the United States and New York State Geological Surveys and the Canadian Geological Survey.

RIESA, rē'zä. A town and railway centre in Saxony, on the Elbe, 33 miles by rail northwest of Dresden. A large bridge of iron and stone here spans the river (Map: Germany, E 3). The town has a public library and a municipal hospital and various special schools. The harbor is good and possesses ample shipping facilities, and Riesa is consequently the centre of important shipbuilding interests and of a large trade, including fish, oil, coal, lumber, grain, iron ore, etc. Sandstone, which is quarried extensively, is also shipped. There are rolling mills and many other manufactories. Pop., 1900, 13,477; 1905, 14,073; 1910, 15,300.

RIESE, rē'ze, FRIEDRICH ALEXANDER (1840–). A German classical scholar, born and educated at Frankfort-on-the-Main. He studied also at Erlangen, Bonn, and Berlin. After holding positions in various institutions he returned in 1869 to Frankfort, where he was a professor in the Gymnasium from 1871 to his retirement in 1901. Besides his excellent editions of Varro's *Satiræ Menippeæ* (1865), of the *Anthologia Latina* (1869–70; 2d ed., 1894), of Ovid (1871–77), of the *Historia Apollonii Regis Tyri* (1871; 2d ed., 1893), of Catullus (1884, with commentary), and of Phædrus (1885), he published a suggestive essay, *Idealisierung der Naturvölker des Nordens in den griechischen und römischen Litteraturen* (1875); two monographs on early German history, *Das Rheinland in der Römerzeit* (1889) and *Das rheinische Germanien in der antiken Litteratur* (1892); *Der Götterkultus im rheinischen Germanien* (1898); *Das rheinische Germanien in den antiken Inschriften* (1913).

RIESENER, rē'ze-nēr, JOHANN HEINRICH (1734–1806). A German cabinetmaker, born at München-Gladbach, Rhenish Prussia. Early in life he went to Paris and entered the workshop of Johann Franz Oeben (died 1766, a pupil of Boulle and protégé of Madame de Pompadour), after whose death he married his widow, carried on his business, and was received as master into the Paris guild in 1768. Specimens of Riesener's work, in the style of Louis XV, executed for the royal palaces, may be seen at Fontainebleau, Trianon, Compiègne, and in the Musée du Mobilier National, Paris, while the majority of it was sold abroad, particularly into England, in consequence of the Revolution.

RIESENGEBIRGE, rē'zen-ge-bēr'ge (Ger., giant mountains). The highest range of the Sudetic Mountains (q.v.).

RIETI, rē-ā'tē. A town in the Province of Perugia, Italy, situated on the Velino, 45 miles northeast of Rome (Map: Italy, D 3). It is well built and surrounded by walls. The fifteenth-century cathedral has a monument by Thorvaldsen. There are an old castle, a bishop's seminary, a Gymnasium, a lyceum, a technical school, and a public library of 30,000 volumes. The chief trade is in wine, oil, and fruit. Rieti, the ancient Reate, was a noted city of the Sabines. Pop. (town), 1911, 14,145.

RIETSCHEL, rēch'el, ERNST (1804–61). An eminent German sculptor, founder of the Dresden school. He was born at Pulsnitz, Saxon Lusatia, and had severe struggles with poverty in his youth and during his early artistic training at the Dresden Academy. In 1826 he became the pupil of Rauch, in Berlin, assisting that master in the completion of various works, notably of the monument to King Max I at Munich in 1829. He studied in Italy (1830–31), and the following year was appointed professor at the academy in Dresden, where he resided until his death, Feb. 21, 1861.

Rietschel's first work of importance was the monument of King Frederick Augustus I (1829–39), in the Zwinger at Dresden, but simultaneously he worked on the 12 great reliefs of the "Principal Epochs of Civilization" (1835–38), in the Aula of Leipzig University. Next came the admirable group in high relief in the pediment of the Opera House in Berlin (1844), with the Muse of Music in the centre, and "The Christmas Angel," a beautiful relief, widely known through reproductions. His fully developed art is shown in the famous "Pietà" (1845) of the Friedenskirche at Potsdam. Among his best creations are the statues of Thaer, the agriculturist (1850), at Leipzig, and of Lessing (1853), at Brunswick, a classical example of realistic portrait sculpture. In 1852 he began the "Emblematic Sculptures" on the exterior of the Dresden Museum, the cornice of which he also adorned with statues of Pericles, Phidias, Giotto, Dürer, Holbein, and Goethe. In the meanwhile he also modeled the heroic-size Goethe-Schiller Monument (erected 1857) for Weimar and in 1857 the bust of Rauch, one of the best portrait busts of the century. This was followed by the quadriga (1860), with the figure of Brunonia, for the ducal palace at Brunswick, cast in copper by Howaldt, and the masterly statue of Weber at Dresden. For the Valhalla, Regensburg, he executed the busts of Luther, Elector Augustus II, and other busts and relief portraits. Of his last and most elaborate production, the Luther Monument at Worms, he was only able to finish the model for the whole and the figures of Luther and Wiclif, while the completion of his design was intrusted to his pupils Donndorf and Kietz (1868). Rietschel was the most important of Rauch's pupils. He united the strict classicism of that master with a more realistic conception, thus directing German sculpture in the paths it was to follow. A collection of casts and models of all his works is preserved in the Rietschel Museum at Dresden. Consult his *Autobiography*, edited and supplemented by Oppermann (Leipzig, 1873), and *Briefwechsel zwischen Rauch und Rietschel* (Berlin, 1890–91).

RIEZLER, rēts'lēr, SIGMUND, KNIGHT VON (1843–). A German historian, born in Munich. He was educated there, became a docent in 1869, and after 10 years as head of the archives and library of Donaueschingen was made librarian of the Royal Library in Munich in 1883 and director of the Maximilianeum in 1885. His works include: *Das Herzogtum Bayern zur Zeit Heinrichs des Löwen und Ottos I.* (1867), with Heigel; *Der Kreuzzug Kaiser Friedrichs I.* (1870); the great *Geschichte Bayerns* (1878–1903); *Die bayrische Politik im Schmalkaldischen Kriege* (1895); *Geschichte der Hexen-*

prozesse in Bayern (1896); *Nachtselden und Jagergeld* (1905); *Studien zur älteren Geschichte Münchens* (1907); *Ortsnamen des Berchtesgadener Landes* (1913).

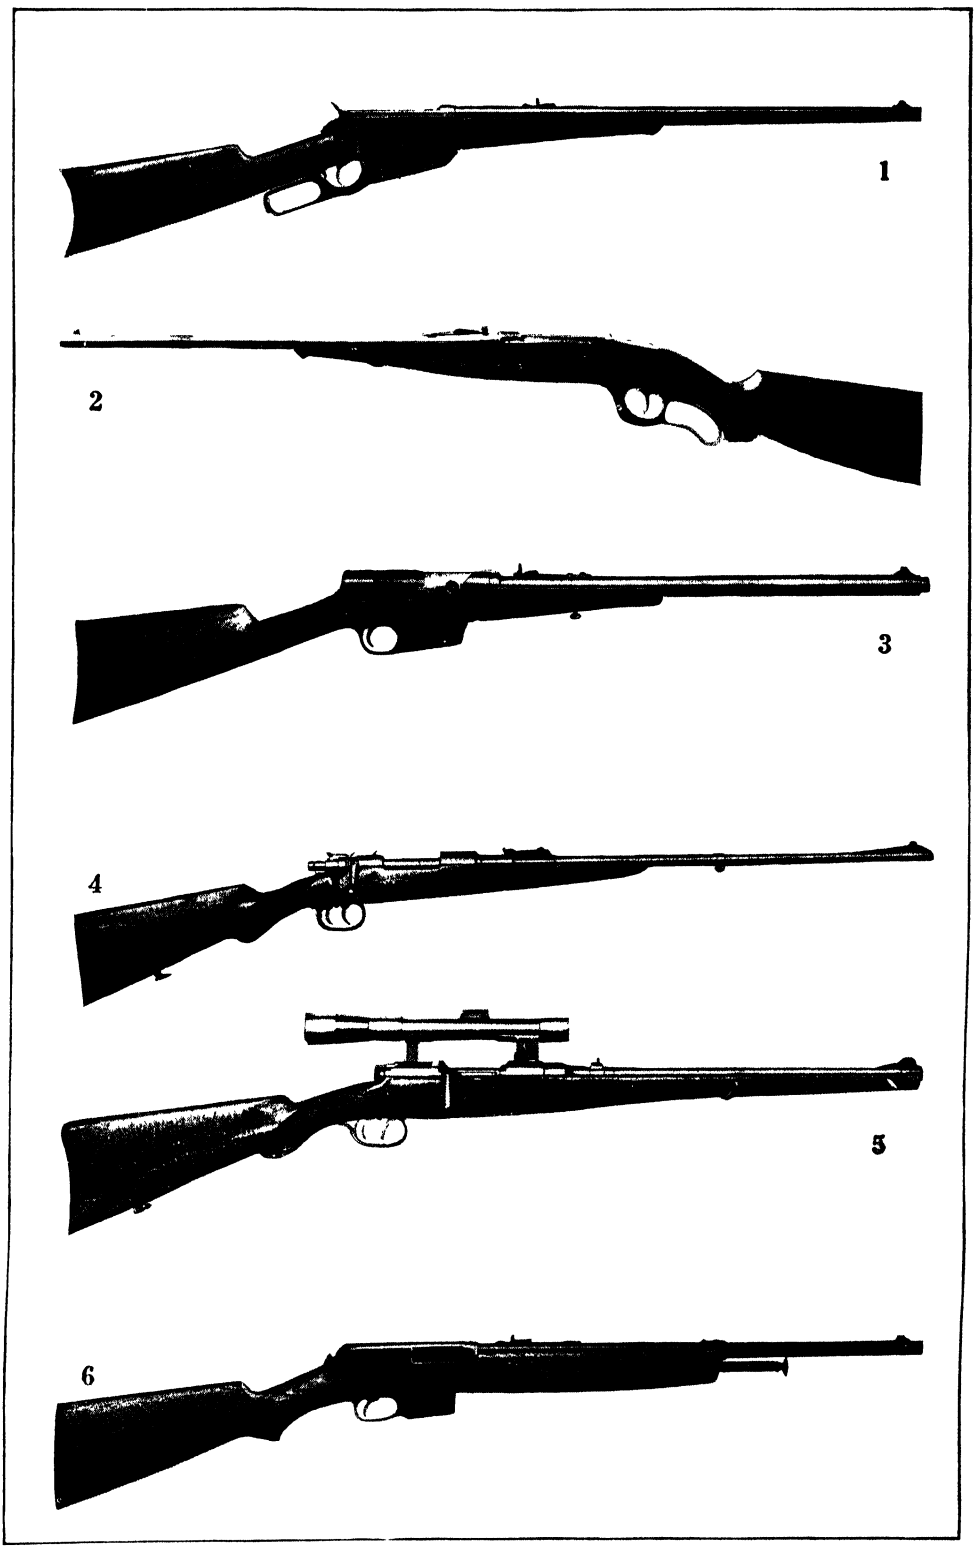
RIFF, THE (Er Rif). A name given to the mountain region bordering the north coast of Morocco from Ceuta eastward nearly to the borders of Algeria and included in the Atlas system. The rugged coast, the principal projection of which is Cape Tres Forcas, is almost without harbors. The inhabitants are pure Berbers in blood. In the French conquest of Algeria they were not molested, and they are said to live in a state of chronic revolt against the Sultan of Morocco. They were formerly noted for piracy. The people understand or speak Arabic only to a very slight extent, Shleh or Shluh being their native tongue. They are said to be untrustworthy.

RIFLE (for *rifled gun;* akin to Ger. *riefeln,* to groove), HUNTING. The hunting rifle antedated the military rifle and until the opening years of the twentieth century was clearly the superior of the two weapons in point of accuracy and general ballistic efficiency. The rifle of the early American colonists was accurate enough for hunting purposes up to about 150 yards, while Brown Bess, the smoothbore musket of the Revolutionary days, could not be depended upon beyond 60 or 70 yards. Indeed it is recorded that at a match in England in 1792 between a bow and a musket at 100 yards, the bow won easily.

The origin of the rifle principle—a spirally grooved bore which imparts a spinning motion to the ball propelled through it—seems never to have been clearly established. Evidently these grooves were at first cut in lines parallel with the line of the bore, and it seems probable that they were originally intended to lessen the fouling of the bore due to the imperfect combustion of the powder, since the grooves would accommodate some of this ash, thereby permitting the ball to come into contact with the barrel. The spiral grooving probably was a development of this expedient, and may have been suggested by the whirling motion of a properly feathered arrow.

Apparently the earliest definite record of a rifle proper is contained in an inventory, dated 1476, of the fortress of Guastella, near Parma, Italy. This inventory mentions specifically a weapon with a spirally grooved bore. Other records indicate the use in Europe of the weapon with straight grooves towards the close of the fifteenth century, e.g., at Vienna and at Leipzig (1498).

The first rifles to be made in America were manufactured by Swiss colonists (from the Canton of Basel) in what is now Lancaster Co., Pa., as early as 1721, according to A. C. Buell's *History of Andrew Jackson.* There seems to be some reason to doubt the accuracy of this date, however, and it is more probable that these rifles were weapons (of the old Yager type) which had been brought to America by the colonists. But Governor Thomas Pownall, of New Jersey, mentions definitely the existence of a rifle factory in the present Lancaster County of Pennsylvania in 1754. This early Swiss-American rifle fired an ounce ball and had a barrel from 30 to 32 inches long, with grooves which turned about one-half of one revolution in the entire length of the bore. Rifles somewhat modified from this type were used in the Revolutionary War, though Brown Bess, the smoothbore musket, was the characteristic military hand firearm of those days. See SMALL ARMS.



Muzzle-loading hunting rifles may be said to have been perfected in America during the half century preceding the Civil War, when a rifle was developed which had a comparatively flat trajectory and was very accurate up to about 500 yards. As a matter of fact this type of rifle showed the highest degree of ballistic efficiency ever attained by any hand firearm using black powder. The breech-loading rifle began to be comparatively common in the United States about 1865. At the close of the Civil War some of the Federal troops were regularly armed with Henry, Sharp, and Spencer rifles, all breechloaders; and the Henry, a lever-action repeater, was the progenitor of the modern repeating rifle of that type. All these weapons at first had comparatively weak breech mechanisms, and being unable, for that reason, to withstand the strain of heavy charges, were actually inferior in accuracy and range to the better class of muzzle-loaders. Once this dangerous defect was corrected, the newer rifle rapidly displaced the older one and incidentally led to the development of several hundred different sizes of black-powder cartridges, most of which are now virtually obsolete.

Then came the magazine or repeating rifle, loaded by hand-worked mechanism and represented now by three different types of loading devices, the lever action, the pump or trombone action, and the bolt action. These weapons are equipped with tubular, box, or revolving magazines. The Winchester Repeating Arms Company produced in 1866 a lever-action repeater with a tubular magazine (under the barrel) which held several cartridges. Moving forward the finger lever drew back the breech bolt, thus forcing back and cocking the hammer and ejecting the discharged shell. The backward motion of the lever closed the breech bolt and inserted a new cartridge in the chamber. This is essentially the lever action of the modern tubular magazine rifle.

The trombone or pump action functions in much the same manner as far as the internal mechanism is concerned, but it is actuated by means of a sliding sleeve arranged immediately in front of the trigger guard, and is therefore operated with the left hand—by the man who shoots from his right shoulder. The bolt action is operated by drawing the breech bolt back and pushing it forward into place again, the two motions extracting the empty shell and reloading and recocking the piece.

Of these three mechanisms the bolt action is probably the most durable, and it certainly is the simplest, as in some of its forms the entire breech bolt may be removed without the assistance of tools, a distinct advantage in case the action becomes clogged or when the rifle needs cleaning. But it cannot be operated as rapidly as the lever action, which may be worked without removing the piece from the shoulder. On the other hand the bolt action has the advantage of having the hammer concealed, and a safety catch device, which greatly lessen the chances of the accidental discharge of the piece. This danger is more or less present, especially in thick brush, when the hammer is exposed, as it is in American lever-action rifles, excepting the Savage hammerless weapon, which carries the hammer mechanism within the

HUNTING RIFLES

1. Winchester .405 Calibre, 5-Shot Rifle. Lever Action
2. Savage .250 Calibre 6-Shot Rifle Hammerless Lever Action
3. Remington 35 Calibre 6-Shot Auto-Loading Rifle
4. Mauser 6-Shot Rifle Bolt Action
5. Mannlicher-Schoenauer 6-Shot Rifle Bolt Action. Equipped with Telescope
6. Winchester 401 Calibre, 6-Shot Self-Loading Rifle

breech bolt. The pump action is the most rapid of all hand-worked mechanisms in its functioning, and is the type most commonly used in very small-calibre rifles, especially the .22, but it has not thus far found permanent favor for big-game rifles.

Of the three kinds of magazines, either the box or the revolving type is generally considered preferable to the tubular (which is confined to the lever-action or pump guns), especially where the tube is exposed so that it may receive a blow which might cripple the weapon as a repeater. Furthermore, the balance of a tubular magazine piece, especially when the tube extends under the entire length of the barrel, changes appreciably as the cartridges are withdrawn. And finally, this type of magazine in its present form cannot with safety be used for the modern, sharp-pointed (Spitzer) bullet, because this point lies against the primer of the cartridge ahead. None of these disadvantages apply to the revolving or box magazines, which carry the cartridges side by side, though a box that protrudes below the frame makes the piece somewhat awkward to handle.

The latest development of the hunting rifle is the automatic or, to use a more precise term, the self-loading weapon, of which several types are produced in the United States. In the Winchester rifle of this type the breech bolt is actuated by the recoil at the moment of the discharge of the arm, with the result that the empty shell is ejected, a loaded one inserted in the chamber, and the piece recocked. In the Remington the recoil is employed to slide the entire barrel, which movement accomplishes the reloading and recocking operations. In the Standard the gas from the combustion of the powder is taken into a tube under the barrel through a small port near the muzzle, after the bullet has cleared the gun. The gas acts on a piston which operates the reloading device. In each case the reloading is accomplished very quickly, so that the piece may be fired with great rapidity. On the other hand it is to be said that thus far these rifles have not been adapted to the most powerful cartridges; that their mechanism is necessarily more delicate than is that of the ordinary repeater, and that conservative sportsmen are inclined to discountenance the use of such weapons, except in the hunting of the most dangerous and aggressive animals.

To the improvement of rifle ammunition rather than of rifle mechanism is chiefly due the remarkable increase in the efficiency of the hunting rifle during the past 20 years. The introduction of smokeless powder (see SMOKELESS POWDER) in a reliable and durable form caused the appearance of an entirely new type of arm, the small-calibre, high-power rifle. The ballistic principles upon which this new weapon was developed are discussed in the articles SMALL ARMS and BALLISTICS, but it is proper to explain here that the slower combustion and greater efficiency of smokeless powder made possible rifling of a sharper pitch (see ORDNANCE) and that the two combined imparted to the small, hard-metal-jacketed bullet far greater velocity and striking power than had been developed for hunting ranges by black powder and the much heavier lead ball. The shocking power of this new missile was insured by leaving the lead core exposed at the point, so that the bullet expanded or mushroomed upon striking tissue even of the softest kind and in that form created a very severe wound.

Because of its greatly increased velocity the trajectory, or curve, described by a bullet fired from a modern high-power rifle, is much flatter than is that of a bullet fired from the old-style black-powder weapon. The effect is, of course, greatly to increase the range within which no allowance need be made for the rise or fall of the bullet, which is a decided advantage to the hunter.

The most recent and in some respects the most remarkable improvement in hunting-rifle ammunition has been effected by the adoption of the sharp-pointed or so-called Spitzer bullet, driven at a very high velocity by a heavy charge of nitrocellulose or some similar powder. Reference has already been made to the high efficiency attained by the best type of muzzle-loading rifle. This efficiency was due primarily to the form of the bullet, which was of the pointed or sugar-loaf type and was carefully introduced into the bore by means of a false muzzle. But because of its short base this bullet could not be seated securely in the first cartridges to be made for breechloaders, and it therefore disappeared with the muzzle-loader. The sound ballistic principle of the slowly tapering missile now reappears in the long and sharply pointed Spitzer bullet, with the remarkable results just referred to. For it seems to be clearly established, not only that much higher velocities and increased accuracy are obtainable with this bullet, but also that if it be traveling at a speed of not less than 2000 feet a second when it strikes, it has an explosive effect upon the tissue which imparts a terrific shock even to such great beasts as the rhinoceros and the elephant. Though this type of bullet is also made with the lead core exposed, so that it will expand upon impact, its shocking and rending effects are clearly observable when the full metal jacket is used. This effect, however, apparently cannot be assured unless the bullet be moving at the moment of impact at or very near the velocity mentioned—2000 feet a second—and the charges of powder at present employed do not insure that velocity beyond about 300 yards, which, however, is well within the normal hunting range. At a lesser velocity the full-jacketed Spitzer bullet simply penetrates the tissue without greatly damaging it, and with comparatively little shock.

The selection of a hunting rifle will of course be determined chiefly by the size and vitality of the game upon which it is to be used, but a few general principles may be stated. The ordinary .22-calibre short cartridge should be used only for target practice and for vermin, rats and the like. For gray, black, and fox squirrels, rabbits, and the smaller mammals generally, the cartridge should not be lighter than the .22 long rifle; while for turkeys, geese, and such mammals as the woodchuck, fox, and coyote, a cartridge of the .25-35 type is about right. In 1912 the Savage Arms Company, of Utica, N. Y., produced a remarkable rifle, whose specially loaded cartridge propels a soft-nose bullet .228 inch in diameter at a velocity of 2800 feet a second and develops a theoretical striking energy of 1206 foot pounds. This rifle is plenty powerful enough for the smaller deer, but for the larger members of that family, i.e., the moose, the caribou, and the elk, and for the large bears, the rifle should have at least

the striking power of the .303 Savage, the .30-30 Winchester, and other weapons of that class, while many hunters prefer much more powerful rifles, like the .405 Winchester, for these large mammals, especially the bears.

The highest development of the Spitzer bullet type of ammunition mentioned above appears to be the cartridge employed in the Savage .250-calibre, six-shot repeating rifle, produced in 1915. This weapon, which weighs only seven pounds, develops the extraordinary muzzle velocity of 3000 feet a second, and the maximum trajectory is only 2.315 inches in 200 yards. The bullet weighs 87 grains, is of the expanding type, and is equipped with a copper jacket, or it may be had in the full-jacketed form. The rifle is declared to be powerful enough for the largest American game. The types of rifles best adapted to African and Asiatic hunting are mentioned in the article HUNTING BIG GAME.

The sighting of a hunting rifle is a highly important matter and should receive careful attention. The best type of front sight is a gold (alloy) or ivory bead, which can be seen plainly in dim lights. Any bright-metal sight should be avoided because of its tendency to reflect strong light, thereby making it difficult if not impossible to tell where the precise middle of the sight is. If an open rear sight is used it should be a straight or only slightly hollowed-out bar, with a small notch. The common clover-leaf or buckhorn rear sight is a bad form, because it obscures the view unnecessarily and is likely also to reflect strong light on its sides. The aperture sight of the Lyman type, attached to the tang not more than 2 inches from the eye, is an efficient form, especially for the hunter whose vision is impaired by astigmatism or myopia. The telescope sight is of much assistance in making long shots, but the instrument selected should be of a kind which can be quickly attached and detached, and it should not have a magnifying power of more than four diameters, as greater strength makes difficult the holding of cross hairs on the mark. See SIGHTS.

For high-power rifles the shotgun butt is generally preferred to the rifle or crescent-shaped butt, though the latter form can be held more securely to the shoulder during rapid firing with a lever-action weapon. The utmost pains should be taken to clean very thoroughly any rifle using smokeless powder as soon as possible after it has been fired. For the bore a strong nitro-solvent oil should be used, as ordinary oil will not remove the corrosive residue, and these deposits will soon ruin the barrel.

Consult Horace Kephart, *Sporting Firearms* (New York, 1912), and Charles Askins, *Rifles and Rifle Shooting* (ib., 1912), both excellent discussions; also Ommundsen and Robinson, *Rifles and Ammunition* (ib., 1915).

RIFLE, MILITARY. See SMALL ARMS.

RIFLE, SPORTING. See RIFLE, HUNTING; SMOKELESS POWDER.

RIFLEBIRD, or RIFLEMAN. An Australian bird of paradise (*Ptiloris paradisa*), with a long curved bill and in size about equal to a large pigeon. The upper parts are velvety black, tinged with purple; the under parts velvety black, diversified with olive green. The crown of the head and the throat are covered with innumerable little specks of emerald green, of most brilliant lustre. The tail is black, the two central feathers rich metallic green. The female is much more plainly colored. The name was given by early Australian settlers in allusion to the resemblance between the plumage of the male bird and the uniform of one of the familiar rifle brigades.

RIFLEMAN and **RIFLE CORPS.** Formerly, the term "rifleman" designated an infantry soldier so armed and equipped as to be capable of greater mobility and more effective marksmanship than was possible with the ordinary infantry soldiers of the line. Modern conditions, however, demand that all regiments alike possess these qualities, so that, with the exception of uniform, the rifleman of to-day differs in no material way from his comrade in the line Throughout the armies of Europe the rifle regiments are dressed in uniforms of black, dark green, or some other shade of inconspicuous color. In England the Rifle Brigade, King's Royal Rifles, Irish Rifles, and Scottish Rifles (see CAMERONIANS) constitute the entire rifle establishment of the regular army, and are all distinguished by their dark-green uniforms, varied only by the facings or by the tartan trews of the Cameronians. The term "rifleman" is frequently used as being synonymous with "sharpshooter" (q.v.), but such is no longer the case. When in 1779 the volunteer citizen soldier became an integral factor in English national defense, he was spoken of as a rifleman and his regiment as a volunteer corps. His uniform was gray, the particular shade of which has since been known as rifle gray.

In the United States army the prëminent characteristics of the soldier, whether mounted or dismounted, have ever been those of the rifleman. In the regulations the words "expert rifleman" are used officially to designate the highest grade of marksmanship, the grades being expert rifleman, sharpshooter, marksman, first-class man, second-class man, unqualified. Rifleman's insignia are, for a marksman, a pin; for a sharpshooter, a silver badge; for an expert rifleman, a silver badge The mounted rifleman was a product of comparatively recent military development. See INFANTRY, MOUNTED.

RIFLING. See ORDNANCE; SMALL ARMS.

RIFT VALLEY. A depression in the earth's crusts formed by a vertical displacement of the strata. In some instances there is a single line of displacement, along which the strata on one side have been depressed, but quite often there are a series of faults running in parallel directions and dividing the strata into blocks which show the effects of differential movement. The depressions thus formed may be occupied by rivers or lakes, and in time they lose their characteristic sharp contours, taking on the appearance of ordinary erosional valleys. Rift valleys are common in mountainous districts all over the world.

RIG, OF A VESSEL. See SHIP.

RIGA, rē'gȧ. A seaport of Russia, capital of the Government of Livonia and the seat of the Governor-General of the Baltic Provinces, situated on the Dïna, about 10 miles above its mouth, in the Gulf of Riga, 363 miles southwest of St. Petersburg (Map: Russia, B 3). The old town on the right bank of the Dïna has the appearance of a mediæval German town, while the suburbs, which contain the bulk of the population, are largely modern. Riga possesses comparatively few ancient buildings. There may be noted the Domkirche, founded originally in the thirteenth century, but rebuilt in the sixteenth and containing one of the largest organs

in the world, and the church of Saint Peter, with a spire 440 feet high.

The castle, now the residence of the Governor-General and seat of the administration, the house of the old association of the Black Heads, the house of the Knights (Ritterhaus), the exchange, the guild houses, and the theatre may also be mentioned. Riga is well provided with educational and charitable institutions. It has a polytechnicum with about 2100 students, a seminary for priests, a school of navigation, a municipal museum, and a library with over 99,000 volumes. It occupies the third rank among the seaports of Russia and the second among the Baltic seaports, next to St. Petersburg (Petrograd)

The chief manufactures are machinery, railway cars, lumber, leather, candles, tiles, glass, tobacco products, etc., the annual value of its manufactures exceeding $30,000,000. The principal harbors of Riga are those at the mouth of the Düna and the Muhlgraben, nearer to the city. Lighter craft go up to the city by the canalized river. The harbor is frozen for a considerable part of the year and is not well protected. Imports and exports in 1912 were valued at $51,127,000 and $110,480,000 respectively; average for the five-year period 1907–11, $38,935,000 and $79,443,000. The principal exports are cereals, flax and flaxseed, eggs, hides and skins, and lumber; and the chief imports, machinery, cotton, coal, and groceries. The estimated population rose from 169,329 in 1881 to 318,400 in 1908 and 334,600 in 1913. About 47 per cent of the population is German.

Riga was founded by Albert I, Bishop of Livonia, in 1201 An episcopal see was established here, which soon was erected into an archbishopric. The town attracted many colonists from Germany on account of the commercial privileges granted to it by its founder, and became in 1282 a flourishing member of the Hanseatic League. Its burghers were involved in conflicts with the archbishops, who sought to hold the city under their temporal power, and with the Teutonic Knights. About the middle of the sixteenth century Riga passed into the possession of the King of Poland. Soon after the archbishopric was abolished In 1621 the city was taken after a long siege by Gustavus Adolphus of Sweden. It passed to Russia in 1710. It was bombarded by the French in 1812 and blockaded by the English in 1854. During the European War which began in 1914 it formed the objective of many German military moves because of its strategic position with reference to Petrograd. See WAR IN EUROPE. Consult: Neumann, *Das mittelalterliche Riga* (Berlin, 1892); Tobien, *Ergebnisse der Rigaer Handelstatistik, 1866–91* (Riga, 1893); Mettig, *Geschichte der Stadt Riga* (ib., 1895); *Der Stadt Riga* (ib., 1901).

RIGA, GULF OF. An inlet of the Baltic Sea, extending in a southerly direction between the governments of Esthonia, Livonia, and Courland (Map: Russia, B 3). It is about 100 miles long and over 70 miles wide. Its water is less salty than that of the Baltic Sea. The gulf never freezes over entirely and is ice free for about two-thirds of the year along the coast. At its southeastern corner it receives the river Düna. At the entrance to the gulf lie the islands of Oesel, Dago, and Mohn.

RIG'ADOON' (Fr. *rigodon, rigaudon,* said to be named after *Rigaud,* a French dancing master). A lively dance of French origin. It was popular in the time of Louis XIII, and was introduced into England towards the last of the seventeenth century. The rigadoon had an unusual jumping step, and the music, in $\frac{2}{4}$ or common time, was spirited.

RIGAS, or **RHIGAS,** rē'gäs, KONSTANTINOS (1754–98). A Greek patriot and poet, born at Velestinos (ancient Pheræ). Until 1790 he was in the employ of the Hospodar of Wallachia and then, joining the revolutionary party, attempted first to form an anti-Turkish committee in Vienna and then at Venice to influence Bonaparte in behalf of Hellenic independence. He was imprisoned by the Austrians and surrendered to the Turks, who executed him at Belgrade. His collected songs were published in 1814, and the Greek paraphrase of the *Marscillaise* is attributed to him.

RIGAUD, rē'gō', properly RIGAUD Y ROS, HYACINTHE (1659–1743). A French portrait and historical painter of Spanish descent. He was born at Perpignan and studied at Montpellier under Pezey, Verdier, and Ranc. After a sojourn in Lyons he went to Paris in 1681 and won the Prix de Rome at the Academy the following year. He rapidly attained European celebrity and counted among his sitters five crowned heads and all the great men of his day. The pompous dignity of the age of Louis XIV is shown by his portraits of that monarch (1701) and of Bossuet, in the Louvre, and of the Marquis Dangeau, at Versailles. Rigaud painted with affectation in externals, but with great skill and absolute truth, and his less formal portraits, such as those of his mother, Marie Serre (1695), of the Duke de Lesdiguières, and of Robert Cotte, all in the Louvre, rank among the masterpieces of French art Rigaud became a member of the academy in 1700. Consult O. M Hueffer, in *French Art from Watteau to Prud'hon* (London, 1905).

RIGAUD, PHILIPPE DE. See VAUDREUIL, P. DE RIGAUD, MARQUIS OF.

RIGAUD, rē'gô', STEPHEN PETER (1774–1839). An English astronomer and historian of mathematics. He was born at Richmond in Surrey, of parents who were Huguenot refugees, and was educated at Exeter College, Oxford, where he became lecturer on experimental philosophy and Savilian professor of geometry in 1810. He succeeded his father as observer to the King at Kew (1814) and followed Abraham Robertson as Savilian professor of astronomy in 1827. In Radcliffe Observatory, which came under his charge at this time, he discovered important manuscripts of Bradley and of Harriot and many other papers. Rigaud published *The Miscellaneous Works and Correspondence of Dr. Bradley,* with an important memoir (1832); *An Historical Essay on the First Publication of Newton's "Principia"* (1838); *The Correspondence of Scientific Men of the Seventeenth Century* (1841, edited by his son; reëdited by De Morgan, 1862); and many valuable monographs of historical interest in mathematics and astronomy.

RIG'BY, ELIZABETH. The maiden name of Lady Elizabeth Eastlake (q.v.).

RIG'DON, SIDNEY (1793–1876). A Mormon elder. He was born in St. Clair Township, Allegheny Co., Pa. From 1821 to 1824 he was in charge of the First Baptist Church in Pittsburgh, but he became convinced that the Baptist doctrines were not in harmony with the

Scriptures and withdrew from the denomination with two other ministers, Alexander Campbell and Walter Scott. From these three grew a sect commonly known as the "Campbellites" (q.v.) though they called themselves "Disciples." (See DISCIPLES OF CHRIST.) In 1830 the doctrines of the Mormon church, but recently organized, were explained to Rigdon by an old friend who had become a Mormon elder, and after reading the Book of Mormon he and his wife decided to join the sect. Rigdon became a close friend of Joseph Smith (q.v.) and the two were associated as leaders of the Mormon church until a short time before Smith was killed, in 1844. When Brigham Young (q.v.) succeeded to the presidency, Rigdon was excommunicated and did not move west with the church, but returned to Pittsburgh. He never abandoned his Mormon faith. He died at Friendship, N. Y.

RIGG, JAMES HARRISON (1821–1909). An English Wesleyan Methodist clergyman, educator, author, and journalist. He was born at Newcastle-on-Tyne, was educated at Old Kingswood School, and entered the ministry in 1845. In 1868 he became principal of the Wesleyan Training College, Westminster, London. He was English correspondent of the New York *Christian Advocate*, and for several years was on the staff and afterward became sole editor of the *London Quarterly Review*. His works include: *Wesleyan Methodism and Congregationalism Contrasted* (1852); *Modern Anglican Theology* (1857, 1859, 1880); *The Churchmanship of John Wesley* (1868, 1878, 1886); *National Education in its Social Conditions and Aspects* (1873); *The Living Wesley* (1875, 1891); *Dr. Pusey: His Character and Life Work* (1883); *Oxford High Anglicanism and its Chief Leaders* (1895, 1899).

RIGGED MARKET. See STOCK EXCHANGE, *Stock Exchange Terms.*

RIG'GING (from *rig*, from Norw., dialectic Swed. *rigga*, to rig; probably connected with AS. *wrēon*, ONorthumb. *wria*, archaic Eng. *wry*, to cover). The rigging of a vessel includes all the ropes and chains used to support or operate her masts, yards, booms, gaffs, sails, etc. It is of two kinds, standing rigging and running rigging. The former is semipermanent and consists chiefly of supports to the masts, such as shrouds, stays, backstays, etc. When once in position these are not moved except when they require slight adjustment or renewal. Yards, gaffs, and booms have some standing rigging for their support or for other purposes. Standing rigging is usually of wire or hemp rope; if the former it is commonly painted, or galvanized, or both; if of hemp it is tarred. For further preservation standing rigging is parceled (wrapped with tarred or painted canvas) and served (wrapped closely with marline or spun yarn). The running rigging of a ship comprises the moving or movable ropes which are used to operate the yards, gaffs, booms, and sails, or to raise and lower the upper masts, hoist weights, and the like. Such ropes are chiefly of manila fibre, but some are of untarred hemp or cotton and others of flexible wire or chain. The most important ropes of the running rigging are the braces (used to swing the yards or keep them properly pointed), the halyards (used to hoist the yards or sails), and the gear attached to the sails such as sheets, clew lines, buntlines, etc. See SAIL; SHIP.

3903
